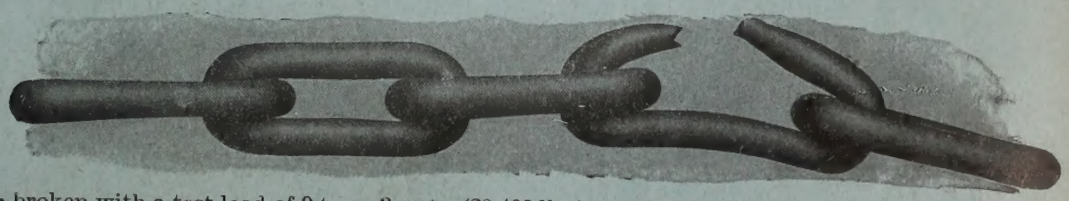
THE STRONGEST CHAIN IN THE WORLD

"Weldless Steel Chain"



Photograph of 7/16-inch Weldless Steel Chain broken with a test load of 9 tons, 3 cwts. (20,496 lbs.), or fully double the Admiralty breaking load for iron chain of this size. Note the elongation and reduction of area at the fracture.

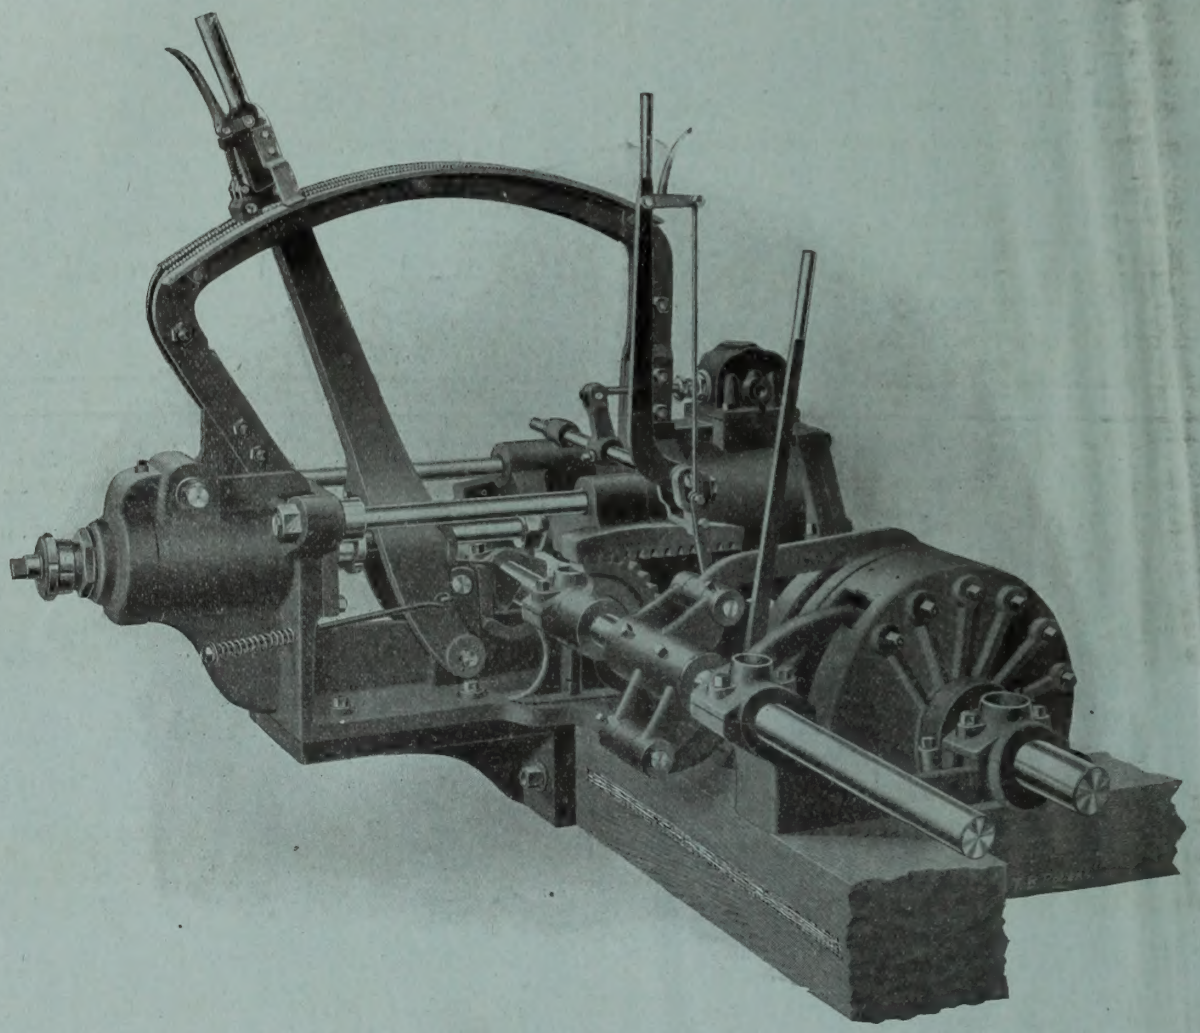
CAN YOU BEAT IT?

WRITE FOR PARTICULARS

B. J. COGHLIN CO., Limited ∴ ∴ **MONTREAL**

Alphabetical Index to Advertisers, page 60

Did you ever really figure what it means to you to increase your cut 2,000 feet per day?



That is, increase it 2,000 feet per day without adding to your cost of sawing.

Or, in other words, what effect will it have on your profits if you can distribute your overhead charges and wages over an output 2,000 feet per day greater than it is now?

If you haven't figured it out, take your pencil and try it now.

You know how much it costs you to run your mill every day—divide that amount by the number of thousand feet per day in your present output—add 2,000 feet to your present output and divide your daily cost by that amount—and the difference between the two results represents the saving per thousand feet in your operating cost.

Then multiply that figure by your total output per season—and we think the result will surprise you, if you have never looked into this before.

This is just one of the ways in which our FOUR INCH STEAM SET WORKS will make money for you, and it will do just this because the users themselves have written us stating that they have increased their cut ***upwards*** of 2,000 feet per day.

May we send you further information about this Steam Set works?

The Buzz of Saws Herald the Start of New Activities

We urge the importance of sending orders in promptly.

New stock will not be in before July—and the present supply is rapidly decreasing.

You are better assured of your order being filled as desired now than later.

Remember, uniformity of grade is our constant aim. And lowest prices possible, consistent with quality.

The mills are all running after the winter season. Better check up your needs in

WHITE PINE

—splendid stock, guaranteed well watered. We supply the finest grades only, in assorted sizes. RED PINE also.

ABOUT SPRUCE

There's satisfaction in ordering Quebec-grown Spruce, the kind we feature. Large supply always ready for immediate shipment.

Timber Limits for Sale on Georgian Bay

The undersigned offer for sale in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; Tug Scow and other Lumber Equipment, including boom chains, plows, sleighs, etc.

The Limits, part of which have recently been sold, include: 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

The Parry Sound Lumber Co., Limited

GARLOCK PACKINGS

Garlock Regular Rings

For all general purposes outside of high pressure work. This Packing is a special grade thoroughly lubricated with the celebrated "Garlock" compound, and is the perfected result of over thirty years experience in manufacturing fibrous Packings.

Garlock Square Duck Packing

Made of good quality Cotton Duck and friction for cold water.

Garlock High Pressure Gaskets

Absolutely heat proof, will not vulcanize or blow out under any steam pressure, being made of long fibre Asbestos Brass Wire Insertion.

Garlock Red Sheet Packing

Made of high grade Rubber compounded in such a way as to give it great strength and reliability.

This Packing has established wide reputation on its own merits.

Garlock Cloth Insertion Sheet

Used on cold and warm water pipes. Is unexcelled in pliability, smoothness of finish and strength of Cloth Insertion.

Garlock Rubber Valves

Specially made to meet specific conditions—absolutely unaffected by oils.

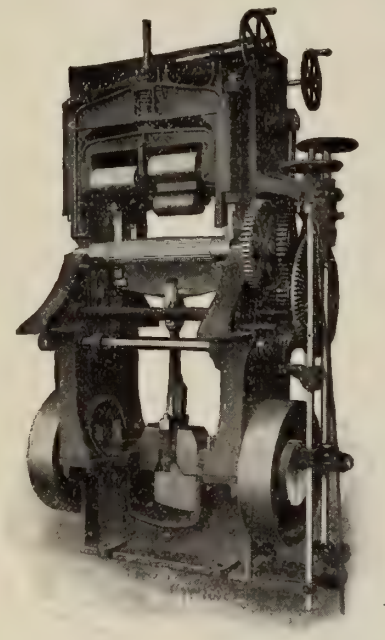
BETTER LUMBER

When all has been said that can be said, every experienced lumberman will admit, not only that the Wickes Gang make the most perfectly manufactured lumber that comes from any kind of saws, but that it will saw lumber more cheaply than can be done by any other known means.



Foreign Buyers always prefer gang sawed lumber

A Canadian customer is installing a gang because he can get 75c per thousand more for gang-sawed deals. And he will not only win the 75c but further profits because of cheaper sawing and by getting more lumber from the logs.

GOODYEAR

Power-Saving Rubber Belting

Goodyear Rubber Belting stands for power saved and money saved. It is built up of plies of rubberized fabric cured and vulcanized into one solid piece. It neither slips nor stretches. It has the cohesiveness of rubber with the enormous tensile strength of close woven, long fibre cotton fabric from which *all stretch has been taken out.*

Goodyear Rubber Belting is manufactured by a process that makes it proof against steam, water, weather and rot. Made in all three grades and all sizes. For Pulp, Paper, Saw Mills—***all*** mills where horse power transmitted is large and demand for tensile strength great. Used by biggest lumber mills and manufacturing plants in the Dominion. ***Outlives, outlasts*** all other belts.

Rot-Proof Mill Fire Hose

Goodyear Underwriters is a hose built to meet the specifications of the Associated Factory Mutual Fire Insurance Companies. Tube used of highest grade NEW rubber. ***Won't*** harden or crack with age. Special circular woven fabric with least expansion or elongation under pressure. Antiseptically-treated to make it rot and mildew proof.

The strongest most reliable hose for all mills and factories. Insist on ***Goodyear Underwriters, the hose with the black and yellow stripes.***

Non-Chipping Conveyor Belts

Built for all purposes. For conveying crushed stone, grain, coal, ore, etc.

Made in all thicknesses of face to suit requirements of buyer. Rubber face made of toughest stock possible, to prevent cutting and chipping. Gives longest, most enduring service.

We also manufacture other rubber goods, such as tires, all kinds of hose and belting, rubber packing, etc.

Write us tonight for catalog and prices.

Our Sales of the last four months 50 per cent. greater than those of last year.
Defective goods returned only $23.93.

Simonds Saws

All there is to a Saw is STEEL, SKILL and STYLE.

The Steel that is in a Simonds Saw has meant that to supply it we had to build a Steel Mill comprising seven buildings which, with yards, cover 14 acres of land. This much for the demand for Simonds Steel.

The Skill that is in a Simonds Saw requires for its operation three complete factories, one at Fitchburg, Mass., one at Chicago, Ill., and one at Montreal, Que. The skill is the result of noting and accepting improvements in methods of Making Saws, as long as Saws have been made in this country.

The Style that is in a Simonds Saw comes from a close study of the style of Saws necessary for best cutting results under varying conditions. Years of experience in the Saw manufacturing business has developed an ability to select the right Saw for any particular use.

The Price that the Consumer pays for a Simonds Saw entitles him to the benefits of Simonds Steel, Skill and Style, these three together giving results or service which means profit.

If you are in the market for any kind of a Saw, Planing Knife, or file. send your order to our nearest office for our immediate attention.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 32 **Toronto, July 1, 1912** **No. 13**

Lumber Manufacturers Win the First Round

Manufacturers of lumber in Canada have great reason to congratulate themselves upon the fact that Mr. Justice Cassels in the Exchequer Court has decided in favor of their contention that lumber which has been dressed on one side and reduced to a uniform width by a further process than sawing is liable to a duty of twenty-five per cent. ad valorem when entering Canada. Readers of the Canada Lumberman are already familiar with the details of this important matter and have had little doubt that if the facts of the case were presented in their true light before Mr. Justice Cassels, the result of his judgment could only be in their favor.

From the very first moment, when this problem was brought up in the House of Commons and made the subject of an extremely bitter political discussion, attempts have been made to cloud the issue, and to make it seem as though the aggressor in the case were the lumber manufacturer. In reality the very opposite is the case, the lumber manufacturer is the man who, throughout the whole dispute, has been upon the defensive. The importer of lumber, represented by some retailers and enjoying the co-operation of the United States manufacturer, has sought to deprive the lumber manufacturer in Canada of what is beyond question his absolute right under both the wording and the intention of the Canadian Customs Act. The Act states in a manner which, to a lumber manufacturer admits of no question, that lumber which has been further manufactured than dressed on one side is liable to a duty of 25 per cent. ad valorem.

No one on either side of the House in Parliament has for a moment tried to argue that the object of this clause was other than to encourage the "further manufacture" of United States rough lumber after it had been imported into Canada. By this means it was sought to develop the wood-working industry upon Canadian soil. If lumber has been dressed on one side and reduced to uniform width by what really amounts to dressing on one edge, it requires no further manufacturing in Canada to permit it to be used for construction purposes, and if it is allowed to enter Canada free of duty, the undoubted object of this clause of the Tariff Act is defeated.

For these reasons, lumber manufacturers have been unable to believe that a just consideration of the facts of the case could result in any other interpretation of the Act than the one that has been put upon it by Mr. Justice Cassels. Unfortunately the whole situation has been dragged into the arena of politics, and when a question of tariff once reaches this stage it is invariably made to appear in the eyes of the public in such strange garbs as are incomprehensible to those who are acquainted with the particular facts. Until this question has been finally set at rest by a judgment from which there is no appeal, lumbermen will have to be content with the uncertainty at present prevailing, and also with the accusations which are levelled at them of being combined together as a trust to extort the highest possible profit from the consumer. Unfortunately the present judgment is still subject to appeal to the Supreme Court.

The Season for Forest Fires

During the end of the month of May and the early days of June, reports of forest fires were received from many parts of Canada. As a rule the serious forest fires do not occur so early in the year. Coming at the beginning of the summer this year they should stimulate all who are connected with the lumbering industry and those whose work takes them into the forests, to adopt the greatest possible amount of caution in regard to their operations. The attention which has been given to the prevention of forest fires during the last few years has given reasonable hope that in the near future there will be a far smaller number of disastrous conflagrations than there have been almost annually for many years past. There is no doubt, however, that under present conditions, the fire fighting forces employed in the different provinces might be greatly increased before anything like an adequate amount of protection would be secured.

During the first week in September there will be held at Victoria, B. C., the annual convention of the Canadian Forestry Association, and the question of the prevention of forest fires will certainly be one of the most important subjects under discussion. It would mark this convention as one of the most important meetings that has ever been held in Canada if it should adopt resolutions of a practical nature which will lead to the governments of the various provinces and of the Dominion, immediately discarding the partial systems of fire protection which have been in force in a number of provinces, and adopting measures of a far more drastic nature than any of which have yet been put into effect.

In this question of fire protection the governments have been far too prone to follow only in the steps of public opinion. By the time public opinion has been well formed on the matter it is to be feared there will be very few forests in which the fire loss has not been enormous, The duty of the governments is in fact, not to follow in the footsteps of public opinion, but to set the pace for public opinion and to out-strip it. Appropriations which have been made up to date by the governments have been ridiculously small compared to the amount of property that is to be protected. When one considers the great sums which are devoted annually to the erection of little public works in all parts of Canada, many of which are alleged to be for the purpose of pleasing constituents and holding their votes, the meagerness of the appropriations for the prevention of forest fires appears in the light of criminal neglect. In the course of a few years the governments of to-day will be judged in this particular far more severely than they are to-day. There are at present only two probable results of that judgment, either the public will commend them for having been far-seeing enough to spend their money courageously and plentifully in the protection of the forests, or they will be found wanting, and will be accused of having been too niggardly and too imprudent to realize the necessity for saving to the people of Canada one of their greatest and most important resources.

It is greatly to be hoped that when the convention of the Can-

adian Forestry Association is in session at Victoria they will not have a visible example of the destruction of forests, to accompany their session. It is not unusual, however, during the late summer and early autumn days that the air is filled with smoke which has travelled hundreds of miles from great forest fires among the valuable timbers of British Columbia. The people of Canada have become accustomed to this heavy pall of smoke and look upon it as almost an annual event. It remains to be seen whether, since the last occurrence of this nature, the activity of our governments have been sufficient to lessen the destruction during the current year.

Government Laboratory Needed for Wood Utilization Study

Many of the more progressive lumber manufacturers in Canada have devoted much of their time to studying the economical uses of their timber. The progress which has been made by individual manufacturers in this direction of late years, has been encouraging and the result has been a remarkable improvement in the profits of firms which have seen the wisdom of this course. Individual firms, however, are seriously handicapped in making a study of this nature. The cost involved is so great as to make it impossible for them to more than touch the fringe of the problem. In numerous cases they have gone quite far enough to be convinced that present methods of utilization are extravagant, and to see that, in order to arrive at definite and profitable information, it would be necessary for them to expend more time and money upon the problem than their resources would justify. The problem is essentially one for the government of the country to approach; not only on account of the initial cost being too great for the individual, but on account also, of the direct financial interest of the government, in the successful development and utilization of the forest resources of the country.

In the United States an experimental laboratory for the study of woods has been established, which is doing excellent work in the direction of finding new uses for various classes of wood, and finding new supplies of raw material for industries which are suffering on account of the growing scarcity of particular classes of wood which has been used exclusively for those industries. The benefits of information obtained by this laboratory in the United States have been admitted by the whole lumber industry of that country. Lumber manufacturers and users in Canada have also been able to profit from the information furnished by the United States laboratory.

Under the above conditions, the Government of Canada should consider following the example of the United States. Canadians need information of a technical nature regarding their timber resources which can be secured only by a Canadian experiment station for investigating the chemical and physical properties of the various Canadian woods. No one can doubt that an experiment station of this nature would be a profitable institution for the country. The conditions of the industry to-day require that it should be established as soon as possible.

The Forestry Branch of the Department of the Interior, which has already done most commendable work in the direction of securing statistics of the lumber production of Canada, has realized, almost from the commencement of its work, that an experiment station would soon be essential, and is making an effort to have one established. The matter was brought up by the Forestry Branch at the last meeting of the Canadian Forestry Association and the proposal was well received. Since that time, different officers of the Forestry Branch have discussed the matter with representatives of the industries which would be most deeply interested, and they have met with encouragement from this source also. The result of these investigations by the Forestry Branch will probably lead, in the near future, to a request being made to the Government that they should establish such a branch. If this comes about those who are interesting themselves in the matter will be able to count upon the general co-operation of the lumber industry.

An experiment station, of the nature under consideration, would enable the Forestry Branch to investigate the properties of different Canadian woods, with a view especially to extending the field of usefulness of some which are, at present, practically non-marketable. It would also serve as a demonstration station from which could be distributed much invaluable information concerning the closer utilization of woods, and improvements in processes of wood-pulp manufacture.

To put the matter in a nut-shell, some of the good results to be anticipated from the establishing of such a station would be: the increased use of Douglas fir as a substitute for yellow pine; the increased use of jack-pine and hemlock for the manufacture of wood pulp; the establishing of wood-pulp industries depending entirely, or partially, upon the use of wood waste from sawmill and other woodworking institutions; the increased use of wood preservative in Canada, where all the woods used in contact with the ground, with the single exception of cedar, are non-durable and capable of preservative treatment; and the establishing of a wood-distillation industry in Canada, depending upon the logging and mill waste of coniferous woods. Even from such a necessarily brief resume of the matter as the above, it is amply evident that the government ought to give this matter favorable consideration without delay. If the timber resources of Canada were far more plentiful than we know them to be, the proposal would still commend itself on account of its economic soundness. With so much necessity for the preservation of our timber resources, the proposal becomes, not only economically, but urgently advisable.

Leaks in the Sawmill

Everyone who has been connected with the working of a sawmill knows a great deal about the splendid opportunities which such an industry affords for losing money in a number of small ways which, when added together, make a very formidable aggregate and sometimes bulk large enough to put the company out of business. "Leaks in the Sawmill," as they are well named by a writer in a recent issue of the Canada Lumberman, are wonderfully varied both in nature and results. They may come from over-anxiety to prevent loss and they may be the result of ignoring small matters which seem to be of little importance. There is no class of "leak" which is more aggravating, when the result becomes apparent, than the "leak" which results from an economy which subsequently develops into a source of expense. One of the most perplexing problems in connection with any manufacturing concern which makes use of machinery in its operations is the question when to get rid of old machinery and replace it with modern equipment.

The expense of new machinery is a great argument on the side of economy and it happens now and then that by continuing to use old machinery one may really save money. It happens more often, however, that the continued use of old machinery when more efficient models are available, is a direct cause of loss to the manufacturer. The small sawmill operator is more likely to persuade himself that expenditure upon new machinery is not needed than is the manufacturer in a large way. Even though a man is only doing a small business, however, he needs the best class of machinery and plant which is adapted to his work. A poorly constructed mill will reduce the output of the finest machinery, and poor machinery will prevent a well constructed mill from furnishing its proper quantity or quality of output. When one is considering the erection or equipment of a mill, however, even though it be a small one, he is justified in deciding to make the building of the best type possible for the work on hand and in installing machinery which will do the work most expeditiously and creditably. Many a small mill has gone under before its time simply because the owner has been too economical in his outlay upon building and equipment. One of the most frequent varieties of lack of proper equipment is the installation of a boiler which

is too small to produce the necessary power. A boiler which has to be forced all the time is certain to cause frequent stoppages for the purpose of getting up steam. These stoppages cost a lot of money on account of the wages of the mill hands, which go merrily on in spite of the fact that nothing is being produced for the time being.

Cheap labor is perhaps as costly a form of economy as anything that could be named. As a general rule, however, in Canada, the problem is not one of "cheapness" in regard to labor, as one of "expense" and "scarcity." Labor in Canada is a much scarcer article in comparison with the amount of work to be done than it was a few years ago. When the sawing season starts in some of the old established lumber manufacturing districts there is great difficulty in securing a full staff of competent hands. Fortunately this applies more particularly to the unskilled labor which is used in shipping than to the higher classes of labor in the mill. Even in the shipping, however, a lot of money is lost on account of careless handling and improper inspection. Money which is spent in securing men who can ship an order exactly as required is productive of results more directly almost than money spent in almost any other manner. The failure to appreciate this point and to pay the minutest possible attention to it, is the cause of more serious leakage in sawmills than many would be willing to admit.

An article upon this subject which appeared in the Canada Lumberman of June 1st ought to be read by everyone who is connected with the manufacture of lumber. It is the product of the experience of a man who has occupied responsible positions in sawmills in many parts of the world, a man who has made a name for himself as a keen observer of methods and results. Readers of the article will appreciate the fact that it lays bare some of the worst troubles in the manufacture of lumber. It is a subject which will stand a great deal of discussion and the views of others in the sawmill business, especially those who are in charge of the manufacturing end will be greatly welcomed by the editor of the Canada Lumberman so that they may be published for the benefit of all others who are struggling with the same difficulties.

Lumber Philosophy

The peculiar habits of lumber piles are often the cause of confusion and embarrassment for lumber dealers and manufacturers. The following characteristic peculiarities, as described by Hardwood Record, will be immediately recognized by experienced lumbermen:

Lumber is a commodity which has more peculiarities than anything else produced by man. Lumber piles have a way of changing widths and lengths suddenly and mysteriously, for if you want stock all 10 inches and wider, 14 and 16 feet long, every pile is sure to contain 6 to 9-inch widths, 10 to 12 feet, while if by an almost unheard of chance you locate a customer who wants all narrow and short stock, the piles are very certain to contain all wide, long lumber.

It has been proven beyond doubt that a quantity of a certain class of stock may be a drug on the market for from three to five years, and finally in desperation a price is put on it that moves it. Invariably within a week letters come from all sections of the country inquiring for this very stock, and it is quite probable that the average lumberman has shed more tears over this fact than over his sins.

Lumber seems to accumulate defects in transit, as many cars of stock are apparently free of knots and other defects when shipped, which when shown to the original shipper or inspector contain many defects that he is willing to swear were not there when the car was loaded.

Lumber will also dry out nicely in pile, but acquire greenness in the car. Witness many cars of stock that are from half green to green when they arrive at destination that were thoroughly dry when shipped.

Chestnut, poplar and oak, and possibly other woods, may be apparently as clear as a bell when in pile and be covered with piles of sawdust and show thoroughly worm-eaten when taken down, much to the surprise and disgust of the owner, who, up to the present time, has found no way to obviate this loss.

We know of a manufacturer who used hickory dimension, and, to prevent the ravages of insects, sprinkled it with kerosene oil, after which it proceeded to burn up. The only satisfaction the owner found was the cremation of the bugs.

In certain sections of the country the writer has known of all oak being piled together and the piles yielding either red or white oak when shipped out, according to the wants of the customer. This is rapidly becoming one of the lost arts, not owing, however, to the loss of magic power by the owner, but rather to the education of the buyer.

Editorial Short Lengths for Busy Readers

United States Postmaster-General Hitchcock has strengthened the forest fire-preventive force of the United States by almost 55,000 men. These men are the rural and star route carriers of the postal service, who are directed to co-operate with the forest rangers and State fire wardens whenever and wherever possible.

Since the Brotherhood of Timber Workers became affiliated with the Industrial Workers of the World the union movement among southern sawmill employees has become one of grave menace. It is reported that the union is getting ready to strike in Mississippi, territory which was singularly free from labor disturbances last year.

Forest fires last year destroyed approximately $50,000,000 worth of property. The Department of Agriculture has been anxious to increase in every way the efficiency of its preventive service. Postmaster-General Hitchcock has found the way to offer assistance, and as soon as his plan was found feasible the order referred to was issued.

According to a dispatch from Grand Rapids, Mich., the hearing before the State Railroad Commission recently on the weight methods of the railroads brought out much interesting testimony. The evidence submitted showed many instances where the stenciled weights on frieght cars were inaccurate, always in favor of the railroad; that scales were defective; that shippers often had to pay freight on snow and ice accumulated after the cars had been loaded and before they had been weighed; that cars were often in bad condition and, unless the shippers themselves cleaned them out, the weight of the dirt was included in their shipment. Instances were reported of inaccuracies of from 3,000 to 8,000 pounds and these errors in effect represented overcharges.

Ocean rates on lumber have gone up so fast lately that European buyers are holding off. The rate from New Orleans to London is now 32 cents a hundred pounds and the rate to Liverpool 30 cents. A year ago these rates were 21 and 20 cents, and they are still going up. It is said that from such a point as Memphis this extra cost on oak lumber is about $4.50 per thousand.

According to word received from a Berwick, U.S., correspondent, the supply of lumber in the Annapolis Valley is rapidly decreasing. Few tracts are left of spruce, hemlock and pine, and these will be cut within a year or two. It is said that the company operating back of the valley to the south, have a ten to fifteen years' supply, but it is believed that their profits are small.

The increasing demand for apple and potato barrels will call for approximately 5,000,000 of barrel and heading stock. The price of barrels was 27 cents at first, but rose almost immediately to 30c. One co-operative fruit company purchased 20,000 barrels at 28c.

"Sized" Lumber Sawn on Three Sides, Dutiable

The case of the Foss Lumber Company versus the King, involving the right of the Dominion Government to exact duties on importation of certain lumber from the United States, which is sawn on one side and two edges, and planed or dressed on the other side, under Item 504 of the Tariff Act of 1907, has occupied public attention very much of late, and certain opponents of the government have endeavored to make political capital out of the situation.

By their statement of the claim, the Foss Lumber Company, Limited, allege that they presented on the 2nd of April, at the Customs House, Winnipeg, a carload of lumber sawn and dressed as above for free entry, which was refused, the customs authorities claiming that the lumber was subject to duty at the rate of 25 per cent. upon its value. The plaintiffs, in order to obtain the lumber, paid the duty, which amounted to $77, under protest, and entered action to obtain repayment and also for the purpose of settling the question of whether such material is duty free or otherwise under the Tariff Act.

In dismissing the action with costs, Judge Cassels delivered his judgment as follows:

"This was a reference under Section 38 of Chapter 140, Revised Statutes of 1906, whereunder the Minister of Customs referred the claim of the Foss Lumber Company to the Exchequer Court of Canada for ajudication thereon. The claimants filed their statement of claims, to which the respondents filed their defence.

"The claim is to recover the sum of $77 customs dues paid at Winnipeg on certain lumber imported from the United States. The amount is small, but it is said that it is a test case involving a large amount. The contention of the claimants is that the lumber in question was free from the payment of duties under Tariff Item 504 in Schedule A of the Customs Tariff. This schedule is a schedule of the Customs Tariff Act of 1907. Item 504 reads as follows: 'Planks, boards and other lumber or wood sawn, split, or cut and dressed on one side, but not further manufactured, free.' The contention of the claimants is that the lumber in question was free from duty as the planks were sawn and dressed on one side only, but not further manufactured. The Crown on the other hand, contends that the carload of planks in question, after being sawn and dressed on one side were further manufactured.

"At the trial, certain admissions were filed. It was intended by the admission to admit that all the lumber in the carload in question was according to these samples. It was admitted at the trial that the samples in question would be taken as samples of the carload. The point of dispute is whether or not, after the planks in question were sawn at the mill, they could be further manufactured in the planing mill, and the claimants contend that if only saws were used, they came within the strict letter of Item 504, and were to be treated as not further manufactured. I am of the opinion that the contention of the Crown is well founded and that the planks in question have been further manufactured and are not entitled to free admission under Item 504.

"After being sawn in the mill the planks were dressed on one side, and with the aid of other contrivances. The sizing was not done with the circular saws or with the gang saws in the mill, nor under the evidence, is it possible to size them in the first sawing. The sizing has to be done with the aid of other machinery and according to the evidence, and the admission of the counsel, there is no machinery in what is known as a sawmill proper which is capable of sizing the planks. It is clear from the evidence that the planks in question came in ready for use as joists and studding. It has been sold to the vendors for that very purpose. The onus is upon the claimants to show that the decision of the Customs Department was erroneous. They have given no evidence to contradict the evidence on the part of the Crown.

"The case was very forcibly argued by the counsel for the claimants. His contention goes the length of claiming that any planks or boards may be completely manufactured for any use the purchaser might desire, and that so long as nothing but saws were used, no matter where the saws were used, it comes within the strict letter of Item 504, and that the planks have to be treated as planks, sawn in the case in point, upon one side and two edges and dressed on the other side. This is not my view of the meaning of the tariff. I am not concerned with anything but the construction to be placed upon the tariff. As to the policy of such an item, that is not a matter with which I am concerned. I do not know why the concession was made, allowing the planks to be dressed upon one side only.

"Reference to Item 503 is important. It reads, 'Planks, boards, clapboards, laths, plain pickets and other timber or lumber of wood, not further manufactured than sawn or split, whether creosoted, vulcanized, or treated by any other process, or not.' Section 504 permits the dressing on one side. It may be that there are two reasons for this concession, first to save the freight, and second for a great many purposes. Any expert with an axe could size them up so as to fit them for building purposes. I think the whole scope of the statute and tariff is to prevent completely manufactured articles being entered free of duty. It would be straining the Act and the meaning of Item 504 to construe it in the manner the claimants seek to have it construed in this particular case.

"I do not think the case of Magann vs. the Queen, reported in Ex. 2, C. R., page 64, covers this case. In that particular case the tariff act provided that oak lumber sawn, but not shaped, planed or otherwise manufactured, might be imported into Canada free of duty. The only question for decision before the judge in that case was whether or not the lumber in question had been shaped within the meaning of the tariff act. It was held it was not. It was also very strongly pressed by counsel for the claimants that what should govern in deciding the case was the condition and the form in which the lumber is produced to the customs and that forms the determining factor in applying any item of the tariff. Apparently, according to his contention, no evidence should be receivable except the appearance of the wood. He cites in support of this the case of the Queen vs. Ayer, a decision of the late Sir M. J. Ritchie, C. J.,

"I think this case has no application to the question before us. In that particular case as pointed out by the chief justice, there were various provisions in the Tariff Act, some of which permitted the ingredients to be entered separately on payment of certain duties. The Ayer Company imported these various items for years, paid full duty, and then it was subsequently contended that after having legally imported and paid the duties chargeable, because they had chosen Canada to put them together and make a compound liable to higher duty if imported in that form, that fraud had been perpetrated and that they were bound to pay the extra duties and penalties. The Chief Justice's simile explains the view. Importation of wine in a cask subsequently bottled in Canada indicates what he meant. As he pointed out the customs tariff provided certain duty on wine if it were imported in bottles. The man imported wine in the cask, paid the duties, and then subsequently bottled it in Canada, and the Chief Justice, referring to the form in which the goods were entered, determined that if they came in under the item of the tariff and the proper duties were paid under the item, it was of no consequence what was subsequently done with the goods in Canada.

"Here is the case before me. The same question is whether the planks in question, after being sawn, went through any other process of manufacture. This is a question of fact, from the evidence. I think the action fails and should be dismissed with costs."

The case has been appealed and will probably come before the Supreme Court in October.

Distribution of United States Lumber Products

The lumber production of the United States during 1909 amounted to 44,509,000,000 board feet. The various uses to which this lumber was put are shown by the following table:

		Per cent total lumber cut	Millions of board feet
(1)	Planing mill products, including sash, doors and general mill work	29.70	13,250.00
(2)	Boxes and crating	10.00	4,448.00
(3)	Car construction	4.48	1,955.10
(4)	Furniture	3.02	1,348.16
(5)	Vehicles	1.97	877.31
(6)	Agricultural implements	.78	350.67
(7)	Musical instruments	.61	273.48
(8)	Woodenware	.51	228.16
(9)	Ship and boat building	.43	192.63
(10)	Trunks and valises	.21	94.98
(11)	Handles	.63	281.64
(12)	Miscellaneous industries	12.30	5,470.00
(13)	Export	6.74	3,000.00
(14)	Sawed ties	2.28	1,017.00
(15)	Rough lumber and structural timbers	26.32	11,750.00

Assuming that practically all of the planing-mill products go into the building trades, these estimates indicate that fifty-six per cent. of the entire lumber production, or 25,000,000,000 board feet, goes into building and general construction work. This amount is made up as follows:

80 per cent. total yellow pine manufactured	13.0 billion
80 per cent. total Douglas fir manufactured	3.9 billion
90 per cent. total hemlock manufactured	2.7 billion
Cypress, white pine, redwood, oak and other hardwoods	5.4 billion

It seems, therefore, that fully fifty per cent. of the entire lumber produced has to be sold in competition with cement, brick, tile, etc.

Quebec's Timber and Lumber Industries

An Increased Export of Timber Expected—Pulpwood Business Experiencing Active Demand — Revenues of the Forestry Branch Increasing

By the Editor of The Canada Lumberman

Quebec, June 20th; (Special correspondence of the Canada Lumberman).—The city of Quebec has many peculiarities which are of keen interest to business men from other parts of Canada. Lumbermen in particular find in Quebec a variety of lumber trade which is of absorbing interest both on account of its present almost anomalous situation and of its romantic and important past. To-day, in Quebec, one finds the head office of many of the most important exporting firms in Canada. At the same time he finds also that in most cases the logical location for these head offices would be in Montreal or Ottawa. Since the early days of Quebec, however, when the timber trade of the city was of far greater proportions and infinitely greater importance than it is to-day, these head offices have been located at Quebec and they seem likely to stay there.

In the early days timber came to Quebec by water. Great rafts of large timbers were floated to Quebec and there taken on sailing vessels to be transported to Great Britain. To-day, the exports from Quebec come in mostly by train and are conveyed to Great Britain on steamships which carry away in one load as much as a sailing vessel used to be able to take away in a season. In the early days the sailing vessels made a brave showing in the harbor of Quebec and in the numerous coves up and down the shore. But the old timber trade has dwindled. It saw its best days, some decades ago. Since then it has been a matter of some difficulty to get good square timber. The easily accessible timber has been cut out and it has been necessary to go hundreds of miles inland to get supplies. This has increased the cost of the timber. Labor and materials, and ocean freight rates have also advanced greatly in price. At the same time the famous Canadian white pine has met with vigorous competition from the timbers of Russia.

Exports of timber from Canada, therefore, have steadily declined. However, there still comes an occasional combination of circumstances which gives the trade a temporary stimulus. During the present year this is in evidence and it is believed that the exports of Canadian white pine timber during 1912 will show an increase. How to account for the change is something of a puzzle. Generally speaking, however, it is to be explained by the fact that last year commercial conditions in England showed an important improvement, which, had it not been for the untimely labor disturbances, would have had a far more beneficial effect than has been the case. In the timber trade better prices were secured in England. The demand improved and the improvement was felt in every country which furnishes Great Britain with timber, Canada among them. Better prices made it possible to incur greater outlay in securing timber, and the owners of Canadian white pine timber were able to go further back for their supplies. Higher prices were directly responsible and many operators turned their attention to timber, with the result that during the present year there is likely to be either a larger production of timber, or a closer consumption of the supplies produced. The timber merchants of Quebec city report an appreciable improvement in this regard. They report also that taking the exports of timber, deals, lumber, etc., all into consideration, the trade with Great Britain, although active, is not likely to show any important increase, as the excess in square and waney timber will probably be secured at the expense of the other lines.

These conditions apply generally to other exporting points in Eastern Canada. The likelihood of only an average export to Great Britain, so far as quantity is concerned, is the result of the labor troubles in England and of the high freight rates for ocean carriage. A year ago freight rates were about 30s. per standard. To-day they are 40s. The cost of the timber or lumber in Great Britain is thus increased by about $1.20 per thousand, which is a serious matter when competition has to be faced from Russian timber, on which the freight rates, though increased in proportion, are relatively light.

Increased Importance of United States Markets

The uncertainties of the markets in Great Britain of late years have directed the attention of many of the manufacturers and merchants of Quebec towards the markets of the United States. This applies particularly to spruce, which, either as lumber or as pulpwood is now going to the markets of Boston and New York in steadily increasing quantities. A prominent Quebec exporter discussing this feature of the trade stated that he found the United States markets far more satisfactory and he believed the future would see a steady increase in shipments to that country and a decrease in shipments to Great Britain. The factors in favor of the United States trade were chiefly two. In the first place United States buyers would take practically the whole product of the log, and in the second place, being so much nearer to the markets it was comparatively a simple matter to adjust any disputes which arose. These advantages had been offset in former years by the better prices to be secured in Great Britain. Lately, however, higher freights to Great Britain and a better demand in the United States had set the tide of trade in the latter direction and it now looked as though the tendency towards shipping to the United States would increase steadily. It is interesting in this connection to note that the increased ocean freight rates to the Old Country at present offset exactly the duty upon rough lumber entering the United States.

A Good Demand for Pulpwood

In regard to the pulpwood industry, one finds in Quebec province to-day, practically only one opinion, namely, that the demand is greater than the supply. Prices to-day are about a dollar higher than they were a year ago and it is difficult to secure stocks rapidly enough. The most important cause of the difficulty in securing pulpwood is the scarcity of labor, which is attributable to the demand for labor resulting from the great quantity of railroad and general construction now in progress in Quebec Province and in Canada generally. The paper making industry of Canada, moreover, is advancing rapidly. New mills are being built in many parts of the country which make heavy demands upon the pulpwood resources. The quantity available for export is thus reduced. In one instance the editor of the Canada Lumberman met with a manufacturer of pulp and paper who had a different tale to tell and who believed that the policy of the Quebec Government in prohibiting the export of pulpwood cut from Crown land was not having its contemplated effect. He stated, moreover, that it had been found possible to convert Crown lands into private lands by inducing settlers to secure grants and then buying their pulpwood. This view of the situation is strongly disputed by every other manufacturer with whom we have been able to discuss the situation and the opinion is generally expressed that the prohibition of export is an excellent thing for the province and that the government is watching the "settler" aspect of the question very closely. Certain it is, that the majority of the pulpwood merchants and others connected with the pulp and paper industry in Quebec Province, with whom we have discussed matters are experiencing a satisfactory demand at good prices and are handicapped only by inability to secure sufficient stock.

Importance of Lumbering to the Province

When one takes into consideration the vital importance to Quebec Province of its timber and pulpwood resources, the conditions as outlined above become of much moment. To an astonishing extent, the prosperity of the province is involved in these industries. The province depends upon them to a great extent for its revenues. The receipts from the forestry branch for the fiscal year ending June 30th will be nearly $1,600,000. A year ago the total was $1,126,000. The average for the last four years was $1,000,000. The careful management of the forestry service is in a large measure responsible for this. At the same time the improvement in the demand for lumber and timber in the home and foreign markets has been an important factor. It is evident therefore that the province must find it of ever-increasing importance to watch closely the methods of lumbering operations, to do its utmost to conserve the timber resources, and to adopt the best measures for ensuring to the people of the province the greatest measure of profit to be obtained from them.

The actual production of lumber and the revenue derived from it are only the beginning of the benefits secured by the people of Quebec Province from the lumbering industry. The province is dotted with wood-working industries in which the lumber for home consumption is converted into a finished article. A list at present practically completed by the forestry branch of the Department of Lands and Forests gives no less than 2,000 of these institutions, including, of course, the saw and pulp mills. It can thus be seen at a glance that when one is able to report a satisfactory demand for the products of Quebec's forests he is able at the same time to report that the province as a whole is prosperous. This is the present situation and the outlook for the immediate future is encouraging.

A dispatch from Vancouver, B.C., states that the Western Canada paper mill at Sapperton, B.C., has broken ground at Coquitlam, a new railway divisional point. for an auxiliary plant, which will be utilized at first for roofing paper, paper bags and later on will turn out cardboard boxes.

Quebec Spruce and Cedar Industry

Exceptionally Favorable Conditions of Present Year Indicate Good Profits—Every Mill Got Out Its Full Drive

By the Editor of The Canada Lumberman

Sayabec, P.Q., June 22nd.: (Special correspondence of the Canada Lumberman). Between Quebec city and the New Brunswick boundary, along the line of the Intercolonial Railway, are located a number of the most important sawmilling industries in the province of Quebec. As one travels through this country he is impressed forcibly with the fact that the sawmilling industry is one of the most important sources of the country's welfare. A large portion of the population depend upon it for their existence, as they are employed, either in the mills or in the woods throughout the year, and their wages, which are steadily increasing from year to year, enable them to bring up their families—which in most cases are far from small—in comparative comfort.

Take for instance the shingle manufacturing end of the business, which is a most important factor in the lumbering industry of Quebec Province. At nearly all of the large mills on the south shore of the St. Lawrence River, a number of shingle machines are operated. These machines give employment to a great many men and boys, in operations of various sorts. When the cedar logs enter the mill they are sawn into shingle bolts by a large circular saw. The bolts are then smoothed off on a barking or rossing machine and pass next into the hands of the shingle cutter, whose work is not only of a skilled, but of a dangerous nature. The shingles are cut and sorted by the man who tends the shingle machine, and they are bundled by boys who receive them from their different sorting chutes. These boys at the bundling and the shingle operators at the machines represent the two ends of the laboring classes in shingle manufacturing. The boys are paid by the number of bundles made, and earn as much as $2 a day. They become wonderfully expert, both at bundling and at sorting. Their chief work is bundling, not sorting, but of necessity they have a little sorting to do and they learn the requirements of the different grades quickly. From these boys are recruited the shingle machine operators, and these men obtain about $3.50 per day. The mills are run six full days each week. Therefore a smart boy makes $12 a week at bundling and the machine operators earn $21 a week. The men therefore earn sufficient to keep them comfortably, while a family with a few boys among its number is able to secure a very tidy income.

Quebec Driving Operations

A feature of the sawmilling industry of Quebec, as compared with the other parts of Canada, is the fact that most of the companies are able to conduct their entire operations from the woods to the saw. It is not necessary to employ any driving corporation to transport the logs to the mills. The mills are located on the line of the Intercolonial Railway, where it crosses the numerous rivers running from the height of land into the St. Lawrence River. These rivers, provide excellent driving facilities, requiring only a moderate amount of improvements. During the present year the driving operations were conducted with exceptional success. A hard winter with plenty of snow was followed by a late spring, during which the water in the rivers reached a great height and came out slowly enough to permit the logging operations to be conducted at a minimum expense. Everyone of the driving rivers presents to-day a unique scene, in the neighborhood of the mills. From bank to bank nothing is to be seen but cedar and spruce logs, extending up the rivers as far as the eye can see. In some places the logs are jammed several feet high and they appear to have come out in volume sufficient to prevent the mills from being able to saw them all during the present season. It is the invariable report, however, that the logs will all be sawn and nothing held over for next year. The demand for Quebec spruce lumber and cedar shingles this year is exceptionally good and with a splendid supply of logs secured at small expense, the lumbermen are counting upon one of the best years they have ever experienced, Not only were the driving conditions good during the spring which has just passed, but the logging conditions last winter were also favorable. This year, therefore, the cost of operating has been less than usual, supplies of raw material on hand are plentiful and the markets are buoyant.

The Rate of Timber Consumption

One cannot avoid wondering as he sees the great quantity of logs which were cut last winter, whether the business is not being over done, and the timber resources consumed too rapidly. The information which is available upon this point, however, is reassuring. The Government of Quebec is paying minute attention to the question of preserving its timber. The agents of the Forestry Branch of the Department of Lands and Forests, visit all the limits of the lumber operators regularly each winter and keep closely in touch with their operations. Reports are made to the Chief Forester and if it appears from these reports that the companies are operating in a manner which will seriously impoverish the limits, or that they are logging in a wasteful manner, the Forestry Service notifies them to this effect and suggests improved methods. Mr. G. C. Piche, Chief of the Forestry Service, reports that the lumbermen are taking their notices reasonably and invariably acting upon them, so that the province has good reason to believe that its timber resources will continue to produce at their present rate at least, indefinitely.

An instance of the working out of practical economics in connection with lumbering operations is afforded by such a company as the Metis Lumber Company, Price, Que. This company is now cutting cedar almost exclusively and permitting its spruce to grow. It is reckoned that after the spruce on the limits has had a rest of about twenty years the spruce will be practically as good as it has ever been. It has already had a rest of about twelve years. It will be possible in another eight years to alter the operations and cut the spruce limits extensively, and if necessary give the cedar a rest. The cedar growth, however, is very extensive and good, as it had never been cut until this company commenced about ten years ago. The company have good reason to believe, therefore, that they have a practically inexhaustible supply of timber.

The lumbering operations of this part of Quebec province have undergone important and interesting changes since the early days. The manufacturing of spruce lumber and cedar shingles is of comparatively recent origin. The case of the Metis Lumber Company may again be used as an example. There have been lumbering operations on the Metis River for the past seventy-five years. In the early days the mills were located near the mouth of the river where vessels could be loaded to carry the lumber and timber by way of the St. Lawrence River to the ocean and thence to Great Britain. The mills in those days were operated by water power and their product was entirely white pine, which was consumed mostly by the British Navy. Prices were low, comparatively speaking, and the splendid white pine then produced did not bring as high a price as the spruce of to-day. One may obtain an idea to-day of the methods of manufacturing adopted in the early days by examining some of the wharves which were then built. At the site of the first mills on the Metis River, which were operated by Mr. Price, the grandfather of the members of the present firm of Price Brothers, of Quebec, there are still to be seen the wharves and piling grounds which were then used. These are constructed of heavy white pine slabs, which had been cut from the logs in making timber for export. They show that the manufacturers were content to use only the hearts of the logs and to discard slabs from which manufacturers to-day would secure a great quantity of excellent timber. The operators of those days, however, were obliged to regulate their business according to their markets, even as those of to-day. There was no market for anything but the best of the timber and the rest had to be discarded. To-day, the white pine of Quebec has practically disappeared. Each mill secures a few white pine logs annually, but not sufficient to make a good sized pile of lumber when they have been passed through the mill. Everything is spruce and cedar and a thriving and probably continuous industry has now been created upon the use of these timbers, for which in earlier days there was no market whatever.

Mr. C. W. Tooke, of Saranac Lake and formerly of Malone, is one of the owners of a $3,000,000 pulp mill at Murray Bay, a description of which was published in our last issue. This is one of the largest as well as one of the most modern pulp mills in the world and employs about 250 men. During the past winter 45,000 cords of pulp wood was cut from the company's forest preserve in Canada. This preserve consists of 400 miles of forest, which is awaiting transformation into pulp. The mill is operated by a power plant, which at the present time develops 10,000 electric horse power, and the capacity of the mill is 100 tons of pulp per day. The operating cost will be much smaller than other mills of the kind having the same capacity, and the plant is considered the finest in the world. It is believed that the timber tract belonging to the company will supply it with wood for one hundred years to come if judiciously lumbered.

Canadian Saw Mill Managers

G. E. Hornibrook, Wolverine Cedar and Lumber Co., Little Current, Ont.

Mr. G. E. Hornibrook, Little Current, Ont.

One of the best known mill managers on the north shore of the Georgian Bay is Mr. G. E. Hornibrook, local manager for the Wolverine Cedar and Lumber Company at their plant at Little Current, Ont. Mr. Hornibrook was born in Bathurst, N. B., in 1873, and when he was ten years of age his family moved to Marinette, Wisconsin. In 1893 he entered the service of the Marinette Lumber Company as head bookkeeper. He had had no previous experience of the lumber business, and some people will wonder at his nerve in having taken a position of such responsibility without knowing anything of the work. But in the lumber business there are many successful men to-day who have had the courage in their early days to tackle a big proposition, with nothing but their determination and their good common sense to bank upon. This is what Mr. Hornibrook did and the result justified those who had placed enough confidence in him to put him in such a position. It was an uphill fight for him for some months. The work was difficult and intricate. Only by close application and long hours was he able to handle the task. For days at a stretch he worked many a time for fifteen or sixteen hours a day. In this manner, however, he laid a foundation which has enabled him to cope with still more difficult duties since that time. While he was occupying the position of head bookkeeper for the Marinette Lumber Company, the mouth of the Menominee River, where the mill was located, was one of the busiest lumbering spots on the continent. No less than twenty-three mills were then cutting white pine at the mouth of the river, all within a radius of one mile.

For thirteen years Mr. Hornibrook was in the service of the Marinette Lumber Company, serving both in the office and the yard, and remaining with the firm until they finished cutting their lumber and closed up their business.

Later, Mr. Hornibrook accepted a position with the Wolverine Cedar and Lumber Company and has been with this company for six years. At first he occupied the position of assistant to the general manager. For the last five years, however, he has been manager of the Little Current mills operated by the company.

That the work in which Mr. Hornibrook is engaged is exacting and varied is known to all who have visited the mills. The output is known for its uniformity of manufacture and grading, and it amounts to about 130,000 feet per day of ten hours, in addition to 40,000 lath. On thick lumber the mill sometimes averages as high as 165,000 feet per day. One of the most interesting features of the plant is the splendid natural facility provided for the drying of lumber. Picnic Island, on which the plant and yard are located, is practically a ledge of solid rock which dries quickly after a rain and does not hold any moisture to stain the lumber. Moreover, the island lies out in the channel in which there is always a breeze to assist in the drying.

Mr. Hornibrook has made a close study of the management of sawing operations. Referring to his work he states that the most important factor in the production of good lumber is the class of labor employed. Loyalty to the employer's interests on the part of all employees from top to bottom, is the only sure basis of successful operation, in sawmills, as in all other lines of business. In this connection Mr. Hornibrook sums the situation up in the following manner:—"Get loyal men and get rid of all others. Pay the highest rate of wages, but insist on getting the best men for every position."

Some other rules which he adopts with success in the general scheme of management are as follows:—

Be careful of all expenditures, large or small, whether for labor, supplies or other items.

Keep plant and grounds in a sanitary condition always.

Watch manufacture closely and have mill grades uniform, so that customers will always know exactly what they are getting.

Be careful of insurance matters and fire protection. If fire fighting facilities are poor be careful to keep equipment in best possible condition. This will be found more effective in case of fire than a first class outfit carelessly taken care of.

These are a few only of the larger problems which are continually occupying the attention of a mill manager. There are hundreds of other details also, which must be closely watched. Only by studying them all and being conversant with all the details in connection with a mill, can a manager hope to make good. That Mr. Hornibrook has been able to hold his position with one of the most progressive and best managed mills in the country for six years, ever since the company came into possession of the mill, in fact, is a striking illustration of the fact that none of these matters has ever been able to escape his careful attention at any time when it was important that it should be looked after.

Switching Charges Reduced

The Baltimore Lumber Exchange, working with other organizations, has scored a great victory in the matter of switching charges, which have long been a subject of discussion and agitation. A long standing complaint has been that the Baltimore switching charges were extortionate and put business under a serious handicap as against other cities. The Interstate Commerce Commission was appealed to for relief and rendered a decision not long ago, but it proved distinctly unsatisfactory. The matter was then laid before the Maryland Public Service Commission, which has made a ruling that orders sweeping reductions, some of the charges being only a fourth or less of what they have been. The order of the commission, issued on May 31, established a switching district which is to remain fixed for five years, with the charges unchanged for the next three years, and until further orders the charges being as follows:

A rate not in excess of $1 a car for all services in connection with yard switching; rates for all services in connection with connecting line switching, not in excess of $3 a car when in connection with a line movement, and not in excess of $6 when in connection with a local movement; rates for all services in connection with intermediate switching not in excess of $4 when in connection with a line movement and not in excess of $7.50 when in connection with a local movement, and a rate not in excess of $5 a car for all services in connection with industrial switching.

The decision is held to give to Baltimore the concessions to which the city is justly entitled, the business men here getting practically what they have contended for. Heretofore the charge for switching a 50,000-pound car from one road to another amounted in instances to $40 and even $50. The State Commission rules that $6 is enough for this service. The reduction will enable the business men, especially lumber dealers, to compete more successfully with other places and to hold their own against rivals.

Largest Lumber Deal in the History of New Brunswick

The taking over of the Alexander Gibson timber areas and sawmills by the Partington Pulp and Paper Company, Limited, at the cost of some $2,000,000, is the biggest deal of the kind that has ever taken place in New Brunswick, and it recalls the history of the building up by one man of a great industry, which has passed to other hands, although its founder still lives at an advanced age in the town which he established years ago. When Alexander Gibson went to the Nashwaak there was an abandoned sawmill and not much else. He built mills, built driving dams all along the river, manufactured lumber successfully, bought more timber lands, leased others from the government, enlarged his operations, built a large cotton mill, and before many years the thriving town of Marysville stood as a monument to the business ability and enterprise of one man. Mr. Gibson retired from any active participation in the business quite a number of years ago. It is possible that a pulp mill will be built at Marysville, and that the one at St. John will be enlarged, and that next year a paper mill to manufacture high grade paper will be erected at St. John. Of last winter's cut of lumber on the Nashwaak, 7,000,000 feet will be rafted to St. John for the pulp mill and about 10,000,000 feet manufactured in the sawmills at Marysville. There is a prospect that pulp and paper making in New Brunswick will be encouraged by the government and more actively developed during the next few years.

Paper Concerns Amalgamate

The Barber Paper and Coating Company is the name of a new firm which has taken over the interests of the firm of William Barber & Brothers and the Canada Coating Mills of Georgetown, Ont. George R. Copping is president, S. P. Duncan treasurer, and I. H. Weldon, secretary. The new company is already in possession. The amalgamation means the practical retirement of the paper making veteran, John R. Barber, from active business owing to his desire to spend his remaining years free from so many executive cares and responsibilities. Out of compliment to him his name is retained in the new charter. Now that he has handed over the large Georgetown interests to the management of others, Mr. Barber retains only the presidency of the Toronto Paper Manufacturing Company at Cornwall. He is also a chief shareholder in Barber & Ellis, Toronto, and has various other financial interests. It is understood that the new company will develop the Georgetown mills along lines much the same as at present, but extensions and alterations are not unlikely.

Pulpwood Production of Canada 1911

Statistics Show Increased Production and Higher Prices—Spruce Still the Leading Wood — Heavy Exports of Pulpwood Still Continue

The Forestry Branch of the Department of the Interior have compiled a report upon the pulpwood manufactured in Canada and the pulpwood exported from Canada, during the calendar year 1911.

The figures given for pulpwood consumption refer only to wood manufactured into pulp in Canadian mills, and include only wood of domestic origin. Wood which is exported raw is given in Table 6. Reports were received from all the mills known to be in operation, with the exception of a twenty-ton sulphite mill in British Columbia which commenced operations in 1911. Otherwise the quantity and value given in the tables of this bulletin may be considered a trustworthy statement.

The 54 firms reporting used, in 1911, 672,288 cords. There were exported in a raw state 847,939 cords, making a total cut of 1,520,227 cords, valued at $9,678, 616. This is 21,401 cords less than were cut in 1910, but the quantity manufactured in Canada was larger.

Over 95 per cent. of Canadian mills cut the pulpwood used by them from their own limits and consequently ross the wood themselves.

TABLE 1.

PULPWOOD, 1910 AND 1911, BY PROVINCES: Total Quantity of Wood Used, Total Value, Average Value per Cord, and Number of firms reporting, 1911.

Province.	1910.			1911.			
	Wood used.	Value.	Average value per cord.	Wood used.	Value.	Average value per cord.	Number of mills reporting.
	Cords.	$	$ cts.	Cords.	$	$ cts.	
Canada	598,487	3,585,154	5 99	672,288	4,338,024	6 45	54
Quebec	342,755	1,879,831	5 48	390,426	2,516,683	6 45	28
Ontario	210,552	1,479,538	7 03	213,667	1,457,224	6 82	14
New Brunswick	22,634	119,620	5 28	45,824	251,858	5 50	4
Nova Scotia	22,106	103,965	4 71	22,221	111,119	5 00	7
British Columbia	440	2,200	5 00	150	1,140	7 60	1

Altogether 73,801 cords of wood (i.e., 12.3 per cent.) more were used in 1911 than in 1910. The average price of the wood also increased, so that the value of the domestic pulpwood industry was greater in 1911 by $752,870, or 21 per cent. The average price per cord was $6.07 in 1908; $5.57 in 1909; $6 in 1910; and $6.45 in 1911. Only 22,229 tons more of pulp were produced in Canada in 1911 than in 1910.

There was a decrease of 93 pounds in the amount of pulp produced per cord of wood; it is difficult, however, to secure trustworthy data as to the output of pulp, since many firms do not give the air-dry weight.

Quebec is the premier pulpwood province of Canada, because of its extensive spruce and balsam fir forests fit for pulpwood, its abundant and cheap water-power and its plentiful supply of labor. The 28 mills in Quebec reported a consumption of 58 per cent. of the total for Canada, or 47,671 cords more than in 1910. The quantity used was 13.9 per cent. more than in 1910, and the value 33.9 per cent. greater. Ontario, although suffering from the flooding of one mill, increased the amount consumed in its fourteen pulp-mills by 3,115 cords, and used nearly one-third of the total production. New Brunswick is recovering from the depression of 1910, and contributed 45,824 cords, or 6.8 per cent. of the total. In 1909 it used 88,450 cords, being 14.2 per cent. of the total, so the recovery is still incomplete. In Nova Scotia, where one large mill was burned early in the year, the consumption has increased by 115 cords as compared with 1910. Low water prevented the mills of New Brunswick from manufacturing at full capacity during 1911. The province of British Columbia is still experimenting in pulpwood manufacture, and the negligible amount reported from this province is manufactured for test purposes only.

In Ontario the price of pulpwood was less by 20 cents in 1911 than in 1910. The increase in the price of wood throughout Canada is due almost entirely to Quebec, where the price increased 97 cents per cord. Of all the provinces Nova Scotia shows the lowest average price for pulpwood, namely, $5.00 per cord.

The increase in the quantity of pulpwood used in 1911 was practically confined to spruce—78,046 cords more of this species being used than in 1910. Poplar increased by 578 cords, regaining third place among pulp woods, while hemlock and balsam fir decreased, the former by 2,140 cords, the latter by 3,075 cords. Most of these changes took place in the province of Quebec, which used 52,446 cords more of spruce, 3,718 cords less of balsam fir, 2,096 cords less of hemlock, and 651 cords more of poplar. New Brunswick also showed a large increase in the spruce used.

Although the reports furnished from the mills do not indicate it, the proportion of balsam fir used is yearly increasing. Balsam fir and spruce are used in mixture in the manufacture of new print. A few years ago it was thought that if the proportion of fir was increased above twenty-five per cent. an inferior paper would result. Greater skill in papermaking has shown that the proportion of fir may be increased to forty per cent. or over. This is now being done by some mills and the resulting paper has proved satisfactory. In various parts of Eastern Canada, particularly in Quebec, balsam fir forms from twenty to fifty per cent. of the forest. The practice of the companies now operating is to take spruce and balsam as they occur in the forest. On account of the preudice still existing against balsam fir, it has not been expedient for the mills to keep track of or report the exact proportion of balsam fir used. Hemlock, which was third in 1910, has retired to fourth place in 1911. Although it has fallen off nearly 60 per cent. since 1910, more than twice as much of it was used as in 1909. There is reason to suppose that a larger export of hemlock took place. While more poplar was manufactured in 1911 than in 1910, it is still below the amount for 1909. Jack pine has not been reported as a pulp wood since 1908. Before that time it was used considerably by two large mills, but has proved unsatisfactory. Arrangements are now being made by mills in Ontario and Quebec for a further use of jack pine.

TABLE 2.

PULPWOOD, 1910 AND 1911, BY SPECIES: Total Quantity, Total Value and Per Cent Distribution.

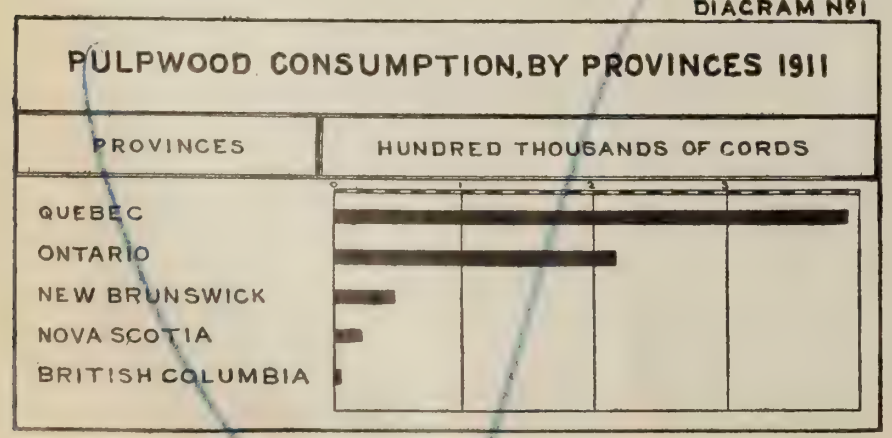
Kind of Wood.	1910.			1911.		
	Quantity.	Value.	Per Cent Distribution	Quantity.	Value.	Per Cent Distribution
	Cords.	$		Cords.	$	
Total (1)	598,487	3,585,154	100·0	672,288	4,338,024	100·0
Spruce	470,230	2,846,678	78·6	548,276	3,548,824	81·6
Balsam fir	120,475	698,608	20·1	117,400	750,950	17·5
Poplar	3,608	21,366	0·6	4,186	25,830	0·6
Hemlock	3,810	16,922	0·6	1,670	8,640	0·2

(1) The total contains a small quantity of wood not identified by species.

The average price of the different species used is the cost to the mill-owner, and so includes varying logging expenses and a wide difference in transportation charges. Maximum and minimum prices for a species in a single province may differ by 100 per cent. The great majority of pulp-mill owners have their own timber limits, and to them the cost of their pulp logs is merely the cost of carrying the limit and the operating charges. Other operators buy in the open market and add transportation charges. Thus the prices quoted are the purchase prices under different conditions, and do not show the relative value of the different woods for pulp manufacture.

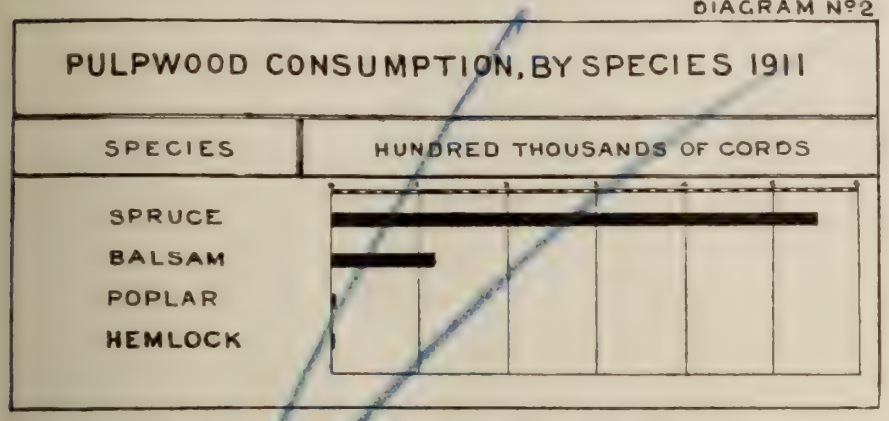
The effect of an excessive hauling distance is demonstrated in

DIAGRAM No 1



Ontario, where the prices of spruce and balsam fir were $6.75 and $7.46 respectively. The high price paid for balsam fir and the sustained demand for this species proves its suitability for manufacture into pulpwood. Over the whole of Canada spruce was the most expensive species at $6.47 or 42 cents more than in 1910. Balsam fir is at $6.40, having risen 69 cents since 1910. Hemlock, though still the cheapest species, advanced 75 cents per cord, its average price in 1911 being $5.18. Poplar has advanced 25 cents over 1910, the price last year being $6.17. The cheapest pulpwood bought was a small quantity of poplar in Nova Scotia, which cost $3 per cord. A small quantity of hemlock in British Columbia at $7.60 was the

DIAGRAM No2



most expensive wood, on the average, used in Canada for pulping; but as much as $10 per cord was paid for spruce in some cases.

During 1911, no slabs or saw-mill waste were reported as being converted into wood-pulp in Canada, but from the reports made to the Forestry Branch by saw-mill operators it would appear that a very small quantity of mill waste is so utilized by three companies operating saw-mills and pulp-mills under the same ownership. This is an economy practised to a greater extent in other countries, and by neglecting it Canada is losing greatly. It has been conservatively estimated that if all useful logs left in the bush by lumbermen, large-sized branches, slabs and other mill waste from the lumber industry in Canada, had been converted into pulpwood in 1911, the annual output of pulpwood would have been increased and not a single acre need have been cut over for logs to make wood-pulp only. During 1910, in the United States, six anda half per cent. of the total consumption was from slabs and mill waste. If economy had been practised to the same extent in Canada during the year 1911, as much pulp might have been produced, without cutting one additional pulp log, as is manufactured from over 43,000 cords of wood. This is almost as much pulp as New Brunswick produced in 1911. The sooner such practical economy and utilization of waste commences, the longer will Canada have an adequate supply of pulpwood.

In Quebec, three-fourths of the wood used was spruce. Balsam

fir made up 23.8 per cent., and the remainder consisted of small quantities of hemlock and poplar. Only Quebec cut all four species used for pulpwood in Canada in 1911. No hemlock was reported from Ontario or Nova Scotia, while New Brunswick used spruce and balsam fir only. In Ontario, spruce made up nine-tenths of the pulpwood used, and balsam fir nearly four-fifths; less than one per cent. wos of poplar. In Nova Scotia, more than four-fifths (81.7 per cent.) of the wood used was spruce, 18 per cent. was balsam fir, and the remainder (0.3 per cent.) was poplar. In New Brunswick 96.4 per cent. of the wood was spruce, and the remainder balsam fir.

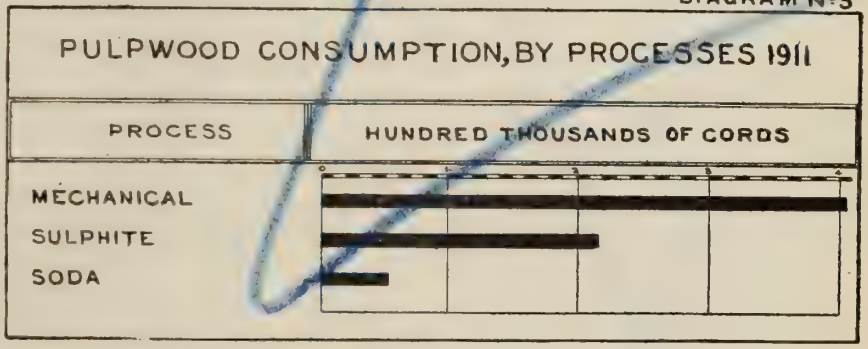
Three-fifths, or 60.4 per cent., of the pulpwood manufactured in Canada in 1911 was manufactured by the mechanical process. The sulphite process consumed nearly one-third, and the remainder (nearly 8 per cent.) was manufactured by the soda process. Quebec made two-thirds of the total mechanical pulp in Canada, more than twice as much as did Ontario. Of sulphite pulp, Ontario produced the most, with Quebec second. The latter province manufactured nine-tenths of the pulp made in Nova Scotia, while over four-fifths of New Brunswick's output was manufactured by the sulphite process. Of the remainder, about half was produced by each of the other processes.

Spruce, as in former years, was the chief wood used in each process. More than half (57.5 per cent.) was made into mechanical pulp; more than one-third (33.8 per cent.) was manufactured by the sulphite process, and 8.7 per cent. by the soda process. In 1910 the proportions were 68.8 per cent. by the mechanical process, 28.7 per cent. by the sulphite process, and 2.5 per cent. by the soda process.

Balsam fir is being used more than formerly in the mechanical process, and less in the sulphite process. It has also been used in the soda process for the first time in1911. The proportions were, in 1911: mechanical, 76.2 per cent.; sulphite, 23.1 per cent.; and soda, 0.7 per cent.; and in 1910: mechanical, 53 per cent.; sulphite, 47 per cent.

Two-thirds of the hemlock used (67.1 per cent.) was manufactured by the soda process; nearly one-fourth (24 per cent.) by the

DIAGRAM No3



mechanical process, and the remainder, (9.0 per cent.) by the sulphite process. In 1910, the proportions were: soda, 84 per cent.; mechanical, 16 per cent.

Although the physical properties of poplar do not adapt it for grinding by the mechanical process, 5.3 per cent. of the poplar was manufactured by this process in 1911; 51 per cent. was manufactured by the sulphite process, and 43.7 per cent. by the soda process. These proportions did not differ materially from those of 1910.

In the United States, the percentage of ground wood-pulp is decreasing. In Canada, it was abnormally high in 1910, owing to the interruption of manufacture by the sulphite mills of New Brunswick. The proportion of ground pulp manufactured in Canada in 1909 was 73.1 per cent.; in 1910, 78 per cent.; and in 1911, 72.9 per cent.

An unlimited supply of clean water is a necessity in the manufacture of wood by the mechanical process. A species of wood is required which has a long, loose fibre, which will not lose its shape and texture in the grinding. For these reasons, Quebec, with its spruce and balsam fir tracts and numberless waterfalls, is the province best adapted for mechanical pulp manufacture; 68.0 per cent. of the pulpwood used in this province is manufactured by this process. In Ontario 53.3 per cent. of the pulpwood is ground; all of Nova Scotia's output is manufactured in this way, and one-tenth of New Brunswick's.

Spruce furnished 77.6 per cent. of the wood used for mechanical pulp in 1911, and balsam fir 22.5 per cent., with small quantities of hemlock and poplar making up the balance. In 1910, the proportions were: spruce 83.2 per cent., balsam fir 16.6 per cent.

The average cord of wood reduced by the mechanical process in 1911 produced 1,783 pounds of pulp. This is 125 pounds less per cord than were produced in 1910, and 133 pounds more than in 1909; but these comparisons depend greatly on the relative condition of air-dryness of pulp. Slightly over half this amount of pulp is produced per cord of wood by either the sulphite or the soda process, but the quality of texture is much better. The paper used in the

average newspaper of to-day is composed of about 25 per cent. of sulphite fibre and 75 per cent. of the ground-wood fibre made by the mechanical process.

Sulphite Process

Of the wood used in the sulphite process, 86.3 per cent. was spruce, nearly half of which was from Quebec, and the same province used 2,134 cords of poplar to make sulphite pulp.

The average production of pulp for every cord of wood used in the sulphite process during 1911 was 1,029 pounds. This is 32 pounds more than last year, but these figures are not very significant, since, as with the mechanical pulp, they depend largely on the residue of moisture.

In British Columbia, experiments are being carried on with the sulphite process, and, in 1911, 150 cords of hemlock were used in the manufacture of paper.

Soda Process

Canada has the distinction of having the oldest soda mill in America, although the process is, at present, not in general use, and is found only in a few mills. About three times as much, however, was produced in 1911 as in 1910, and the growth of this branch of the industry may be expected to continue in the immediate future. The increase of kraft paper, for which a few mills are now being equipped, will result in a large manufacture of soda pulp.

The soda process was the principal method used in the reduction of hemlock. Small quantities of poplar and balsam fir and a large quantity of spruce were also used in 1911. Of the total, spruce formed 92.7 per cent.; poplar 3.5 per cent.; hemlock 2.2 per cent. and balsam fir 1.6 per cent., the last-named species being considered unsuitable for this process.

Quebec manufactured 90.6 per cent. of the pulp made by the soda process; 8.3 per cent. of the soda was from New Brunswick, and 840 cords of poplar consumed by this method in Ontario made up 1.6 per cent. of the total.

The average amount of soda pulp produced per cord was 939 pounds, or 90 pounds less than by the sulphite process.

The annual consumption of pulpwood per mill in Canada during 1911 was 12,450 cords, as compared with 11,735 cords for 1910 and 12,442 cords for 1909. The largest mills are those of Ontario, which used an average amount of 15,262 cords. The average consumption per mill in Quebec was 13,944 cords, in New Brunswick 11,456 cords, and in Nova Scotia 3,174 cords. In 1910 the consumption per mill in the different provinces was as follows: Ontario, 14,037 cords; Quebec, 13,710 cords; New Brunswick, 5,658 cords; and Nova Scotia, 3174 cords.

TABLE 4.

Exports and Imports

Canada's foreign trade in wood-pulp has not kept pace with the growth of the industry. Unfortunately, more than half the pulpwood cut is still exported in the unmanufactured form. This is a direct loss to the country, for the increased value due to manufacture is given away. The data in the following tables refer to the calendar years, and have been furnished by the Department of Trade and Commerce:—

TABLE 5.

EXPORT OF WOOD-PULP: 1910 AND 1911: Quantity, Total Value, Average Value per Ton, Per Cent Distribution and Chief Countries Importing.

[1] France, Belgium, Mexico, Australia, Cuba and Japan, in 1910; in 1911 export was confined to Newfoundland.

Exports of wood-pulp were less by 69,463 tons in 1911 than in 1910. The exports to the United States, however, increased by 3,103 tons, so the decline was entirely in the transoceanic markets. The decrease in this quarter has continued for some years. In 1908, the United States took only 57.1 per cent. of the mechanical pulp exported from Canada, and 79.5 per cent. of the chemical pulp. These proportions have steadily risen, until in 1911 they were 99.1 per cent. and 99.8 per cent. respectively. The export of chemical pulp to the United Kingdom has fallen from 7,519 tons in 1908 to 68 tons in 1911. The mechanical pulp shipped to the British Isles decreased from 78,510 tons in 1909 to 1,847 tons (not one-fortieth as much) in 1911. In 1910, six countries in addition to the United States and Great Britain bought pulp from Canada, to the amount of 12,280 tons. In 1911, the only country other than the United Kingdom and United States purchasing Canadian pulp was Newfoundland, which purchased eighty tons of mechanical pulp. Higher average prices have been obtained in the United States than elsewhere; and the fact that pulp has been imported into Canada in the face of a 25 per cent. duty shows that the home market is not glutted. The home market has increased its consumption from 34 per cent. of the total domtstic pulp output in 1908 to 47.8 per cent. in 1911; but it is not yet equal to the United States market, which consumed 51.8 per cent. The British market took the remaining 0.4 per cent.—a considerable reduction from the percentage of 34.4 in 1908.

Imports

From the statement of pulp imports given below, it would appear that pulp can now be produced more cheaply in Sweden, Norway and Germany than in Canada. The price of raw material is almost certainly greater in these countries, but the lower price of labor and the smaller profits which are satisfactory to capital are factors in their favor. Since Canadian manufacturers must compete in the world's markets with these countries, it is evident that taxation of their limits should be adjusted with due consideration.

The following statement is based on authoritative information supplied by the Department of Customs:—

From	1910	1911
United States	$38,326	$53,167
Sweden	10,966	20,258
Great Britain	10,996	17,265
Germany	10,996	1,720
Norway	10,996	1,361
Total	$48,322	$94,071

According to the Forest Products Bulletins of the United States, that country imported 423,721 tons of pulp in the fiscal year ending

June 30th, 1910, and 550,898 tons in the fiscal year ending June 30th, 1911. On comparing these figures with those of Canada's exports, it will be seen that about half of these imports were from Canada, no account of raw pulpwood being taken.

The export of pulpwood in a raw state shows a considerable decrease in 1911, being less than at any time since 1907. The decrease is entirely in the province of Quebec, both Ontario and New Brunswick showing an increased export as compared with 1910. All raw pulpwood is exported to the United States.

In Table 6, which is based on authoritative information supplied by the Department of Customs, a detailed comparative statement is given of the quantities of pulpwood manufactured in Canada and that exported raw.

In 1911 some 21,401 cords less wood were cut for pulp in Canada than in 1910, and 95,292 cords less were exported.

Over 55 per cent. of the pulpwood cut in Canada during 1911 was sent out of the country without further labor being expended on it. The United States manufactured it into pulp and paper. The amount paid for this wood was $5,340,592, or an average of $6.29 per cord. As the average paid by Canadian mills was $6.45, this is an average of 16 cents per cord less paid for exported pulpwood, at the point of shipment. This difference is comprehensible when it is remembered that the great bulk of the pulpwood cut for export now comes from private lands, which are generally more accessible thant he Crown lands from which the domestic supply is largely drawn. It is also probable that wood of inferior species, cuch as hemlock and poplar, made up a large proportion of the export.

From bulletins of Forest Products of the United States it is seen that approximately one-third of the pulpwood imported by that country is manufactured into mechanical pulp and two-thirds into

TABLE 6.

Canadian Pulpwood Exported Unmanufactured vs. That Manufactured in Canada, 1910 and 1911: Quantity, Total Value, Average Value per Cord and Per Cent Distribution.

	1910.				1911.			
	Quantity.	Value.	Value per Cord.	Per Cent.	Quantity.	Value.	Value per Cord.	Per Cent.
	Cords.	$	$ cts.		Cords.	$	$ cts.	
Pulpwood produced in Canada	1,541,628	9,795,190	6 35	100·0	1,520,227	9,678,616	6.37	100·0
Manufactured in Canada	598,487	3,685,154	5.99	38·8	672,288	4,338,024	6.45	44·2
Exported in raw state [1]	943,141	6,210,042	6.58	61·2	847,939	5,340,592	6.29	55·8
Exported from Quebec	779,000	5,090,000	6.53	82·6	636,136	3,958,423	6.22	75·0
Exported from New Brunswick	90,000	647,000	7.19.	9·5	122,698	810,959	6.61	14·5
Exported from Ontario	74,000	473,000	6.39	7·9	89,050	570,990	6.41	10·5

[1] A very small quantity was exported from Nova Scotia.

chemical pulp, and that a cord of wood produces about one ton of mechanical or half a ton of chemical pulp. This means that from the 847,939 cords of Canadian pulpwood sent to the United States in 1911, 282,646 tons each of mechanical and chemical pulp were made. The value of these 565,292 tons of pulp, for which, in the form of pulpwood, Canada received $5,340,592, was, at the average prices ($15.55 and $38.24 respectively) paid by United States importers of mechanical and chemical pulp, $4,395,145 and $10,808,383, or altogether $15,203,528. Thus Canada got little more than one-third of the amount she would have received if all the pulpwood were converted into pulp on Canadian soil. As the United States do not export two per cent. of the amount they import, and derive nearly one-third of their total consumption from Canadian sources, there need be no fear that a market for Canadian wood-pulp would be lacking.

As the report of the United States pulpwood consumption for 1911 has not been issued, comparisons cannot be made between the two countries for 1911. In 1910, however, the pulpwood shipped from Canada, consisting of spruce and poplar logs, furnished 23 per cent. of the entire pulpwood consumption of the United States. This means that 63 of the 272 pulp-mills of the United States ran for the year, employed help, and paid profits on raw products furnished by Canada. The four most important pulpwood states of the union benefited from Canada's resources as follows:—New York state drew nearly one-half (47 per cent.) of its pulpwood from Canadian forests; 18 per cent. of Maine's consumption came from Canada; 2 per cent. of Wisconsin's, and 52 per cent. of New Hampshire's were from the same source.

If the pulpwood exported in 1911 had been reduced to pulp in Canada, it would have supplied 68 mills of the average size of those in Canada. Thus one hundred and twenty-two mills instead of fifty-four would have been operating in Canada, employing Canadian labor and advancing Canadian industry.

The provincial laws affecting the export of pulpwood within the exporting provinces have changed considerably in 1911. In 1909, pulpwood from private lands in Ontario and from all lands in Quebec and New Brunswick could be shipped to points outside of Canada. In that year, however, the province of Quebec issued more restrictive regulations, which came into force on the 1st of September, 1910, prohibiting the export of unmanufactured wood cut on Crown lands within the province; and in 1911 New Brunswick passed legislation to the same effect, coming into force on the first day of October of that year, too late to affect the 1911 export trade.

The effect of the Quebec legislation is noticeable this year. The export of raw pulpwood from that province was decreased by 142,864 cords, or 18.3 per cent. Its domestic consumption increased by 47,671 cords, or nearly 14 per cent, and three new mills were started in addition to several others under construction. In the other provinces taken together, the export of raw pulpwood incerased by 47,662 cords, or 29 per cent.; the domestic consumption was increased by 26,130 cords, or 10.2 per cent.

Montreal Sustains Good Buying

General Satisfaction over Prevailing Conditions—Dimension Timber in Demand—An Excellent Season

Montreal, June 26th (Special correspondence of the Canada Lumberman):—With well sustained buying of all kinds of lumber, trade remains in a satisfactory condition. Indeed, for certain lines the demand is bigger than the supply, particularly of dry lumber, and it is almost impossible to obtain birch. Without exception, lumbermen express satisfaction not only with existing business, but with the prospects for the immediate future. As long as the building boom continues, there is certain to be activity in lumber. With the briskness indicated, prices naturally have a tendency to advance, and quotations all along the line are firm.

There is an excellent call for dimension timber, and with the large contracts which are being let all over the country, the outlook for this section of the trade is very good.

Export business to Great Britain has been to some extent interfered with by the strike in London, which has had the effect of tying up vessels trading between that port and Montreal. Then, too, there has been an advance of 10s. per standard in the freight rate to Great Britain, and this naturally is calculated to restrict transactions in view of the keen competition on the other side of Russian lumber.

Fortunately better news is to hand in reference to the supply of cars and the congestion of the terminals. Cars are now coming forward at a greater rate, and although the yards are still full of freight, the position is more satisfactory than it was a short time ago. It is now admitted by the railway companies that trade has grown faster than they can handle it, although the Grand Trunk Railway Company states that from now on there will be a prompter unloading and delivery of goods.

There has been a change for the better in the ground wood situation; the demand has considerably increased, and the prospect is that shipments will go forward with more briskness, and that before a month is over stocks will have been reduced to a minimum; in fact, a shortage in the fall is expected.

The proposed freight increase on Canadian pulp wood to United States points is one cent per 100 lbs., or 35c. a cord, and it is understood that the higher charge will come into effect in September. The American interests, who naturally object to this advance, threatened reprisals in the form of securing bigger freights on Canadian pulp and paper, but in spite of this, it is believed that the railway companies will enforce the increase on pulpwood going to the United States, on the ground that the traffic is now unprofitable.

New Maine Forestry Office

Mr. James W. Sewall, who has acted as treasurer and manager of the Forest & Timber Survey & Exploration Department of the Appleton & Sewall Company, has left that concern to open a forestry office at Old Town, Maine. Mr. Sewall has associated with him, almost the entire forestry staff of the Appleton & Sewall Company, and is prepared to render first-class services to any individual or corporation requiring estimating of timber, surveying or mapping of wild lands. Mr. Sewall will not have a department of tree surgery, but will carry on straight forest engineering only.

At a meeting of the shareholders of the Spanish River and Ontario pulp and paper companies, held last month at Torinto, the Ontario Company was absorbed by the Spanish River shareholders on the basis of two shares of Spanish River for three of Ontario. The capital of the parent company will be increased to three million dollars of preferred stock and four millions of common. One million of common will be used for the absorption of the Ontario company and the remaining million each of common and preferred will be held in the treasury for possible extensions.

Retailers' Ethics, Status and Problems

Relations with the Wholesaler and Salesman—A Statement of General Principles—Manner and Cost of Doing Business

At a recent meeting of the Ohio Association of Retail Lumber Dealers, a number of addresses upon subjects of every-day practical interest were discussed by the members who delivered addresses. Among the subjects was an interesting one entitled "Why I Like (or Dislike) the Retailers," which was delivered by Mr. W. E. Ford. Mr. Ford's remarks in part were as follows:

Why I Like (or Dislike) Retailers

By W. E. Ford

After mingling with lumber dealers for more than twenty years, I am convinced that as a whole no more honorable body of business men exists in any profession than is found in the retail lumber business.

I say as a whole. Of course there are some exceptions to this rule in the lumber business as well as in all others, and to these exceptions to the rule, I wish to address myself on behalf of the salesmen.

All sensible dealers will admit without argument, that the traveling salesmen are their educators. They come to you every day with the lumber market fresh and new, and they come not only one, but three, four or a dozen, each one giving you the very latest price on his particular kind of lumber, or doors and sash, until by night you have had the conditions so thoroughly drilled into you, that you are perfectly posted on the market condition and, with all this, only to start in on the following morning with the same course of training, And this is continued day after day, until no matter if your head is as dense as a piece of eucalyptus, you are simply forced to know lumber prices.

Now, these men come to you at great expense to the firms they represent, and inconvenience to themselves. They not only have the expense of salary, hotel bills and railroad fares to face, but they have to contend with the annoyance of everything incident to a traveling man's life. You expect him to appear in your office as a gentleman, and you have a right to insist that he does that. Now, what is your duty toward him and the firm he represents? Do you think it would be right to look over your last year's estimates, before you recognize the salesman? No! And yet this is sometimes done. Do you think it would be proper to ignore the salesman, while you go on swapping stories with one of your continuous bench warmers? No! Yet, we have seen this done. What would you think of the firm he represents, should you step into their office and receive such discourteous treatment? I dare say that under such conditions, if your thoughts were audible, they would be more forceful than elegant.

I beg of you put yourselves in the salesman's position. Meet him on the level; make him respect you by showing him the courtesy due a gentleman, and then if he persists in boring you, give him the boot. In the lumber business disputes and disagreements are bound to arise, and always will, as long as we depend upon the judgments of men in the grading of lumber. But in the adjustment of such claims, always remember the divine injunction of that Greatest of All Teachers, "Whatsoever ye would that men should do to you, do ye even so to them."

Wholesaler and Retailer

A good address was delivered by W. L. Whitacre, on "The Wholesaler and the Retailer." The talk was in part as follows:

You have heard of the good qualities of the salesman, and how well the retailer loves him, and how the world would be a blank but for him.

This is surely a gospel truth, for I veritably believe that the business and the life of the retailer would be rather dull were it not for this ray of sunshine and information who is constantly visiting you at least once a month—and you look for him, too. He is one of your invigorators, and suggesters, and is nearly always bound to have something up his sleeve that will make your method of business more potent in bringing the desired results, and along with his free offers of ideas, he nearly always tells you that he has just the class of lumber, or the styles of front doors or porch columns to sell you which will work wonders as advertisers to you, and will make your yard distinctive as one having all of the very latest patterns of No. 1 common flooring, or a new style of 8 x 10 barn sash.

Commercialism has become so vast as to embrace the entire world, and so minute as to permeate every hamlet of every country.

The commercial traveller is the point of contact between the wholesaler and manufacturer, and the retailer, and is a wonderful force in the dissemination of the news of the day, together with the live, up-to-date principles of business.

No ambassador or minister carries greater trust or responsibility when he goes forth to serve his country than does the real true salesman who goes about representing his firm.

Evolution of the Wholesaler

The wholesaler of to-day is the natural result of the meetings and good friendships established between the travelling lumber salesman and the retailer, and has come from a laudable ambition on the part of the salesman to be in a measure his own master, and thus place himself in a line to better serve his many good friends, the retailers.

The wholesaler is strictly a creature of evolution, and we find that this is brought about largely upon the conditions that make it incumbent on the retailer to have something which he can be assured is strictly first class, and which he can feel assured, when his friend the wholesalers tell him it is O. K., that the stock will come in just as represented.

The retailer has not the time, nor can he afford for his own particular wants to go and look up the articles that will best suit his trade or community.

The wholesaler, through his many years of experience from handling the lumber from the stump almost to the consumers' hands, and from his keen observation of the wants and usages of the various sections into which his travels carry him, is particularly fitted to act as your medium for the purchase of the best stocks that the various mills manufacture, and also to guard you against the many poor items that they may make along with the cream.

I feel that you all appreciate the peculiar fitness of these men who have inspired your confidence during all the years that they have been calling upon you.

You also know that they are proficient and reliable in their selection of stocks and the particular ones from whom you buy are honest in their representations to you of what stocks are, and what the conditions at the mills are. They usually are in position to have advance information on market conditions, and are free and willing to share such information with you, thus putting you in position to cover your short wants, or to use care against ordering too heavily in case of an anticipated decline.

Wholesaler Best Informed

The good live wholesaler is possibly the best informed as to general conditions of any one in the business. He knows what is doing at the mills, he knows your conditions, and he knows the general conditions which might affect conditions at either end of the line.

By thus being in possession of all the facts, I believe I am not stating it too strongly when I say that his judgment and advice are correct in all cases, and the wise retailer will always talk with such a wholesaler before he makes up his mind to do this or purchase that block of stock, or make some move that is important to his business for the coming season or year.

I feel that I need not enumerate any more facts concerning the wholesaler, as you are most of you quite familiar with him, and I trust that those who have not given him the careful consideration that they should will revise their ideas, and I know they will prosper even more in the future than in the past.

A Fact Discovered

There is one important fact which every wholesaler knows, and I am glad that many of the retailers have found it out, and that is, that good lumber and sash and doors cost good money to produce, and in this age of the world it is a mighty hard job to get something for nothing. There are still a few retailers trying to do this, but they are mighty few and far between.

The real up-to-date buyer has learned to his sorrow that much shopping and time occupied in trying to get this something for a cheap price has in a majority of cases resulted unfavorably.

A certain retailer informed me not long ago that he had by careful buying and shopping, writing about forty letters, been able to save $8.56 on a car of lumber that I wanted to sell him, and which I had guaranteed him as O. K. and very cheap at the price.

This same man spent at least $15 worth of his time in getting all of these different quotations, and when the car came in I happened to be around, and found him sorting the car over. I did not ask him what he was doing, but I will say that he was not raising the grade any.

Many of the complaints which you have are simply due to the fact that you have over-bought on the car. Some over-ardent salesman comes along and you say that you want a certain grade of stock,

and when he makes you his price you say it is too high, that you are able to buy the same grade at a less price. This salesman, not wanting to go away from an order, takes it, thinking that he has some stock which will get by. He has not the nerve to say to you that he can't furnish you the same high grade stock on which he has quoted you at first, and that he expects to ship from a point where the stock will conform to the price. The consequence is that the car comes in, and you immediately compare this car of $21 flooring with some which you have possibly paid $23 for, and make a kick.

The wholesaler has to suffer, but he is not to blame. It lies with the salesman first, and possibly equally guilty with him is the buyer.

Why Wholesalers Know

My friends, your friends the wholesalers have been to the source of production, and the sooner you learn that when they tell you so, the stock is worth the money, the better you will all be off. I know that you are saying, "I got beat by following this the other day."

Either this same wholesaler was the victim of some irresponsible employee at the mill, or he was dishonest and unfair in his statement. If this latter, you should cut him off your list. If the former treat him as you would wish yourself to be treated. Do not hesitate to count and give him credit with the average on the stock, as well as to deduct the item of 170 feet shortage.

Along this line of the tallying of cars when you receive them from the wholesaler or manufacturer, allow me to say that none are infallible, and the man who claims never to make an error or a mistake, is one who really will bear watching. But from twenty-five years' experience in the lumber business, I wish to say that I never knew of but two firms who intentionally shipped short measure.

To-day I do not think that a single firm intends to do this, and when you are making claims for so-called shortages please take into consideration that an error is just as likely to occur in tallying the stock in your yard as at the point of shipment.

There are still retailers who are wont to accept the very superficial and hurried count of some teamster or hired man and stand on this as absolutely correct, when if they had themselves tallied this same stock it would have conformed to that of the invoice.

The wholesaler wants to know when there is anything wrong, and if you do not report a just kick we have no means of knowing that the mill may be shipping something that we have not bought, and you will be conserving your own interest as well as that of the wholesaler when you take it up at once with him.

The One to Adjust Complaints

The wholesaler being the party who is nearest to reach, and is best fitted to know what is right in the matter, usually can adjust any just complaint to your satisfaction and that of the mill, where if you should be dealing with some one 800 or 1000 miles away, and probably with some officious clerk in the office, your difference or complaints would not receive the same careful attention, and there would be more likelihood of there being harsh words written, and worse feelings engendered.

The lumber business of to-day is a science, and there is no good reason for you to feel that lumber should be getting cheaper or that it will last for always. The timber is now worth so much, the cost of producing so much, and the transportation so much more, and you may rest assured that there will be no great variations in prices, particularly downward. It behooves all of us to conserve our own interests, treat each other by the only code of ethics that will ever amount to anything, that of the Golden Rule.

Speculation in both buying and in selling is not conducive to large profits at the inventory periods, and about the very best rule to follow is to buy as your needs seem to justify, and you will have fewer cut price sales, the market will remain more uniform, and you will be more firmly intrenched in the good graces of your customers, and will have a more kindly feeling for both the wholesaler and the manufacturer.

The Cost of Doing Business

John D. Hicks discussed the "Cost of Doing Business," some of his remarks were as follows:—

It was first suggested that I talk on overhead cost—a phrase that I dislike—a phrase that was probably coined by some one who sought a term to cover that great array of multitudinous facts that enter into the cost of doing business—that we, because we are lacking in an analytical mind fail to take into account, a term that, like charity, is made to cover a multitude of sins.

What we wish to know, is why don't we make more money or perhaps in many instances why don't we make any money?

And in this day when the mail man is bringing to your desk that great load of literature setting forth "Short cuts to business success"—"Sure processes of arriving at costs"—"The magazine system"—and the Lord knows what not, I am coming to you with just a few brief statements and an old fashioned plea. No man knows what it costs to run a business save the man that runs it; no man knows what it costs to manufacture a given article except the man that makes it, and he does not always know or there would be fewer failures.

Why Success is not Greater

I have already given you the principal, the greatest, reason as to why we do not succeed better. We are lacking in that we do not study our own business, do not make a more minute analysis. Let me give you (and I hope you carry it home with you) an old definition of cost. I say old—it is not from the literature of which I just spoke; about the last thing you read in that class was the failure Success—but from John Ruskin, a man who did more for his fellows along this very line than any other of his day. The definition was given by him in 1863.

Value—is the life giving power of anything.
Cost—The quantity of labor required to produce it.
Price—The quantity of labor which its possessor will take in exchange for it.

I have given you this because I feel sure we will all find it advantageous to keep in mind how near synonymous are Cost and Labor.

Find Your Own Costs

Most business men fix the selling price from what they think is the cost price plus a given percentage, which is good provided you are sure as to the cost. And now my plea—find this out for yourself. If some one tells you it cost 15, 16 or 20 per cent. to do business, don't use his figures. He doesn't know what it costs you. Analyze your own business—be sure that every item of expense that represents labor is cost and that it goes into your figure on which you expect to base your selling price. If it be hay and corn, wagon and driver or administrative, be sure your sometimes called salary account goes into your general expense. Get you a vest pocket book for this purpose and analyze as it comes to your notice. If some man tells you it cost $13 a thousand to handle dimension and sheathing, don't take his figures for your use. Find out for yourself. This is no arduous task I am asking you to impose upon yourself. You will find it pleasant and one of the most profitable things you have ever done.

Here are a few things that I have found it necessary to figure into expense. You may find others. You should figure in interest on your capital stock. We will say you have a business capitalized at $30,000, of which $7,000 is yours. Where did you get it? Did you steal it? No—the probability is that you worked like thunder for it. You are entitled to your earning on that capital. You are not only entitled to it—you are criminally negligent if you don't get it. Most men say add 6 per cent. I say add 3 per cent. I don't know where I can get an investment for my money absolutely safe that will pay 6 per cent., without lying to the tax collector.

You have depreciation. You may say you keep up your repairs and this goes into your expense account. But nevertheless there is depreciation. The insurance people are the best authority and they will tell you that despite your repairs still there is depreciation.

Interest and Discount

Most merchants keep an interest account and a discount account, and carry the hope that the discount account, which is in on the credit side of the ledger, will overbalance the interest account, which is on the debtor side of the ledger. These accounts are not closed until the end of the business year. Whence comes the interest account? At some period during the year's business your volume of trade has so increased or business become so bad that you are compelled to go to the bank for money. And the banker gets the interest. If your interest paid exceeds your discount taken to be sure that you figure it into your expense. It probably will.

Figure in your loss by bad accounts. You all have them, more or less—mostly more. The brightest credit man in the United States to-day can hope to minimize them only to a certain extent. Good authorities say that the best managed business will show a loss from bad accounts of at least one-tenth of one per cent. Determine for yourself your average loss for the last five years and be sure that amount becomes a part of this gross on which you expect to base your selling price—because it is so much better to anticipate it in the gross than to deduct it as a whole from the net profit at the close of the year's business. You can depend on old figures in present day problems. The mill loss on lumber ten years ago is not the loss of to-day in the mill. As the price went up the grade has also gone down.

Watch your labor and cut out the unremunerative or unnecessary labor; that is merely a matter of habit.

Get a Little Book

Get a little book and work out your own cost in your own way. Cooperate with your competitor to find out the real cost of doing business. That eliminates bad competition. The restriction of business profits within legitimate bounds depends on just two things—

full and free competition and that competition intelligent competition. Bad competition produces the two extremes—millionaires and paupers; but cooperation will tend toward a more equal distribution of wealth.

Last thought: The gross amount of all items of expense will be a certain per cent. of your gross sales; and when you come to apply this per cent. be sure you do not err.

For example: If the cost of doing business is 20 per cent. on your gross sales do not add to the wholesaler's price 20 per cent., or you will realize only 16 2/3 per cent. If you want to add 20 per cent. to cover the cost of doing business you must add 25 per cent. to the price you pay the wholesaler for the material.

The Right Way to Sell Lumber

By E. H. M.

This subject is by no means a new one, but on the contrary is one which has been up for discussion on several previous occasions and has, upon each of these occasions, been ably handled by men of undoubted ability to enlighten upon this branch of our industry. It shall be my purpose, however, to treat this subject in a somewhat different manner than has characterized its handling heretofore, and in this way I hope to avoid the appearance of plagiarism upon the sayings of those who have treated the subject before. Instead of discussing the strong and weak points of making a specific sale, or of the efficiency or inefficiency of the sales managers in charge of the merchandising end of our industry, I deside to discourse upon the "Best Methods of Selling Lumber" and by "Best Methods" I mean, how can we realize most for our product under all circumstances?

I would like to point out as the ideal merchandising condition an absolute absence of competition, but realizing as I do the impossibility of a realization of this ideal condition, then I would say that next to the ideal condition, give me intelligent competition. By intelligent competition, I mean the direction of salesmen and sales methods by well-informed authority which at all times considers market conditions, studies the wants of the consumers and keeps abreast of the times by knowing the conditions of stocks, both in the hands of producers and the consumers as well, and is thus enabled in a measure at least to anticipate the tendencies of the market for the immediate future.

I submit that these, and a great many other essentials, cannot be obtained by the man handling the sales of small manufacturers for the reason that his total production is not of sufficient proportions to justify covering the entire field, and it is with the sales departments of these smaller manufacturers that we often find the commission man a large and potent factor in making the price, not only for the concern whose product he sells, but in doing that he also establishes the price for competing concerns. This would seem to indicate that the product of any plant can best be marketed, owing to the great many kinds and grades of lumber manufactured by every plant, only by covering almost the entire consuming territory, thus reaching the proper market in which to sell every grade and kind of lumber.

Viewing this matter from a purely economic standpoint, it would appear that only by recognizing and establishing a community of interest among the manufacturers whose production is limited can the best results be obtained. This could be done, in my judgment, by establishing sales offices through which ten or a dozen mills can market their product on an equitable basis and to all parts of the country, because the aggregate volume of these mills enables the sales office to send sales representatives into all of the consuming territory, thus enabling each grade and kind of lumber to seek the market where it will command the highest possible price.

These sales offices could be owned by the manufacturers whose product they handle, thereby insuring to the manufacturer proper participation in any possible profits which may inure from the sale of his lumber both as to any higher price which he may be able to serure and also from any moneys which may be earned by the selling office in the form of profits for dividend purposes.

From a number of years' experience in the merchandising of our commodity, I have been able to observe a great many things which, in my judgment, are operating against the economical handling of our product. For instance, it is not infrequent to see as many as six or eight salesmen calling the same day on the small one or two-yard town buyers. These men often represent mills located geographically in the same neighborhood—mills whose product is about equal as to grade and manufacture, and whose product could be harmoniously handled through one selling office and the expenses of these various salesmen, in excess of one, could be converted into the "Profits and Distribution" account; and another feature which might be considered in this connection is the element of competition which might be less vicious with five of the six salesmen eliminated.

The salesman for the one mill often finds his stocks broken on a great many items and he is forced to pass up a great many orders which he could doubtless have accepted had he represented ten mills instead of one, as it seldom happens that all of the mills are short on the same thing at the same time. This, however, only goes to make up the higher cost of selling on the unit, or independent plan.

Another matter which appeals to me as an argument in favor of the selling office, is the trade in car material. Every salesman realizes the value of a personal acquaintance in selling lumber. This is as true in selling to purchasing agents for railroad and car companies as it is with the yard trade. This acquaintance can only be established by frequent visits on the part of the salesman. The salesman can only visit the purchasing agent gracefully when he has something to sell. The average amount of car siding, lining and roofing as produced by one mill would not necessitate many or frequent visits to the purchasing agent, at least not with any degree of economy in the selling department of his business. But, assemble ten or more of these mills into one selling organization and you at once establish a dignified source of supply with sufficient material to offer to cause the purchasing agent to take notice of you. He recognizes here a source of supply where he can turn for his requirements in such amounts as to justify the top of the market as to price. These buyers of large quantities of this class of material prefer to place their orders in large lots, thus simplifying, in a measure, the details of the transaction and unifying the policies of the parties at interest.

Another feature which seems to me to argue for the establishing of these selling offices is the advertising or publicity feature. A number of mills, whose interests become amalgamated in one selling office, can, at a nominal cost to each, advertise their business and take proper rank with the trade, whereas, acting singly these various mills would find the cost of a vigorous and effective advertising campaign exceedingly heavy and out of proportion.

But to sum up this matter and to conclude, I submit the following: That for lack of co-operation and amalgamation in the merchandising of our products, we are employing ten times the number of salesmen to sell our product that would be necessary if the manufacturers could group their products into say ten mills to one selling office; that they could lose none of their identity or independence by the process, as these selling offices could be owned by the mills whose product they handle; that competition would be less various with nine of every ten salesmen eliminated; that the mills would realize more money for their lumber because of the stronger canvass for the business under the increased volume and essential competition; that because of the larger aggregate of supply under the amalgamation of interests, one would be able to reach and hold a class of trade which otherwise one could not afford even to call on; that one could afford, under this arrangement, to employ at a nominal cost to each mill at interest, the very best and ablest lumber merchants to handle the merchandising end of the industry; that, by the employment only of high-class merchants in the sales departments, one would establish intelligent competition and insure for your product at all times the highest price that the market conditions will justify or permit, which, in my judgment, constitutes the "Right Way to Sell Lumber."—Pioneer Western Lumberman.

The Big Sideline for Retailers

The big side line to the retail lumber yard and to the jobbing planing mill is contracting. This is not news to some, but it does need new, fresh, or greater attention. It would perhaps be news to some, also, to realize just the extent this idea has gained ground during the past year, says the St. Louis Lumberman.

It was brought freshly to mind one day recently in a conversation with a retailer from a city in which there are half a dozen yards. Something was said about the contractors and contracting, and his answer conveyed the idea that he was in the contracting business. When asked about it, he said, yes, and also that every lumberman in the town, every retailer, did contracting. He said some of them felt they had to do it to handle their business right, and after part of them got at it others had to take it up to protect themselves, and the strange thing about it is that while evidently some of them took it up reluctantly, all seem to be well pleased with it and figure that they are better off by it.

This idea of contracting as a side line to the lumber and planing mill business has many angles to it, many different points from which to view it, and it is well to look at it from all sides that you may have a thorough understanding of it and know whether or not it is best for you in your own community.

There is one case in mind that illustrates a peculiar angle of it. Where a man with a lumber yard also equipped a planing mill department, he didn't go into it on a large scale, but put in enough machines to supply the needs of his trade for old stock, and while occasionally he had to send to outside mills for some special thing, he could generally supply his trade with standard goods and from his own mill, and get fairly prompt action out of it.

One of his important customers who is a contractor in his own

town got the notion that he would buy a little planing mill machinery and set up a shop of his own. This idea got around to the lumberman before it was put into execution. Then the lumberman had an interview with this contracting friend and told him in substance that if he (the contractor) put in his own planing mill and went to doing his own work in that way, that he (the lumberman) would simply go into the contracting business. The upshot of it all was that the contractor concluded that he would rather hold to his business and buy his lumber and millwork from the lumberman than have this lumberman in competition with him in the contracting business, and that's the way they are jogging along to-day.

There are some localities where the lumbermen and contractors and builders work so nicely and harmoniously together that it is not advisable for the lumberman to branch out into the contracting business. He is not generally inclined to do so either, when surroundings are as favorable as this. But, unfortunately, these instances are not very plentiful, and it is too often the other way around.

When the contractors and builders in a community are prone to dicker around and try to get cars of lumber direct and inclined to buy from mail order houses, sash and doors and things of that kind, and their trade is hard to hold, about the best way for the lumberman to save himself, hold his trade, and meet the competition of mail order men and others, is to get a good crew of men and go into the contracting business himself .

Moreover, he can go further than that if he has plenty of capital. He cannot only contract to build houses for others that are planning to build, but he can plan and build houses for sale himself. Take up the building business, and if he handles the matter well make of this a good investment for surplus capital and an excellent feature of his lumber and contracting business to take care of crews during dull times and to use up material that may be accumulated on hand.

The argument here for the retail lumberman applies equally to the planing mill man and often there is a three-sided combination of lumber yard, planing mill and contracting. There are some planing mill men who claim that without the contracting end of their business they would make but little money in the planing mill. There are others, of course, who make good money with the planing mill alone and without contracting, and no matter whether a man contracts or not, each branch of his business should make its own profits. Otherwise he is sacrificing one to the other, and that is never real good business.

There is one thing that a combination of this kind will do, It will make for more harmony in working together between the lumber yard or mill and the contractor on the building than it is possible to get out of it any other way. In planning buildings and using stock the builder can often humor the mill and the mill can humor the builder, and they are more likely to do this when both are owned and operated from one common head.

So, when the matter of branching out or taking up side lines is up for consideration, let this idea of contracting receive the lion's share. It is the biggest thing in the way of side line connected with the lumber business. So big, in fact, that it is really a side partner to lumbering and to the planing mill, and the indications are that in the future there will be much more of it than in the past. In fact, the record of the past year, if it could be produced, would show, perhaps, more retailers and planing mills having taken up contracting than ever before in the same length of time.

What is Overhead Cost?

We have gotten into the habit of considering overhead cost of manufacture as meaning all of the cost of running the business except that of materials and productive labor, says Chas. Cloukey, in the Wood-Worker. That this is true in the main goes without argument; but it would seem that the shortcomings of cost systems are made up of very perplexing and annoying exceptions to easily-understood rules.

In many manufacturing plants the working time of some of the employees is divided up between productive and unproductive labor. Of course, the time sheets are supposed to set forth the correct amount of time spent on each class of work, and if they are faithfully made up, it is a matter of auditing to separate them. However, when we come to give these working hours their equivalent in dollars, we have two or more separate problems in hourly rates.

How do we get at a rate for productive labor in the first place? It is the practice of some concerns to divide all the overhead pro rata among the productive labor. Of some others, the plan is to lay some of the burden upon the materials used, the logic of this being that both material and labor are operating costs which are subject to apportionment to the several items manufactured.

At any rate, we will suppose that the hourly schedule of wages includes the wages actually paid and their just share of the overhead, and that the sum is as nearly correct as may be. With this rate in mind, we take the time sheet of a man who has spent half of the day working at his machine, and the other half of the day working on his machine, or, in other words, repairing or putting it in order, without producing any output, and charge, say, four hours to the job at 75c. an hour. Now, it is very clear that the other four hours is an overhead item of itself, and is it good business or good accounting to add overhead to overhead? Many persons of experience, I think, would answer at once that it is not. However this may be, one of the perplexing items which now and then come up and make us sorry that we have not kept up our algebra as we should. If this man has worked under the direction of a superintendent or machinist whose salary is a legitimate overhead charge, then this portion of his time should bear its ratio of said overhead. If the time of machine men is rated higher than the time of bench men, so that a part of the overhead must be earned by the machine itself, then should not its own repair carry a portion of the overhead?

If a man spend an hour lacing a belt which does not delay the operation of any machine, or if he repairs a truck, the bare amount of his wages should be charged to overhead.

Here is another case, of another kind, though, and has to deal with the work of men whose salaries are all charged to overhead of one kind and another. By this I mean improvements to the plant which have been put in by men hired to do maintenance work. It is obvious that the value of these improvements must not be measured alone by the amount of materials used, but the labor expended upon them should be charged against them, together with its proportion of overhead, the same as any other productive labor.

Now, it is evident that work like this is going to complicate matters and make it difficult to determine just what really is overhead, if we are not careful in getting this time from men who are not supposed to keep it, and charging it up at the proper figure. And this is not all, for if we charge up part of our overhead into an asset of the company, that part ceases to be overhead and should be deducted from the same. Here we must be careful again, and not take out of the overhead all the labor we have charged to the improvement, but only that part which represents the actual wages paid to the men or persons involved.

This may seem rather prolix when we consider that the overheads for the coming year are based upon estimates rather than upon absolute figures, but if our preceding years are faulty in their apportionments, of how much value are our present estimates, which are based upon the previous figures?

It is a fact that the very nature of some enterprises makes it much more difficult to determine the proper overhead charges in some cases than in others. For instance, a concern may do a manufacturing business, and at the same time be engaged in each branch of the business, and others in all of them. Certain expenses are peculiar to each department of the enterprise, but the business is run as a whole. We may know what the total overhead is, but it will take good judgment, as well as careful data, to divide it properly, so that our estimates may be reliable.

It is not enough to know that we are making a profit as a whole, but we want to prove that all of our men and machines and merchandise are making their share of profit after paying their share of the expense. And it is a fact that the profit-making employees should not be confined or restricted to those commonly termed "productive labor," but that every dollar of the concern invested in material and labor should return its expense and profit. If a man spends all of his time handling merchandise, then that merchandise is increased in value to the amount of the man's wages, and said wages should be charged up to the material, and not to some other man's work. Just how to do this is the live problem in more than one office, but it we will make a careful analysis of the work done by "unproductive labor," and place the figures in the right columns, there will be a reasonable show for reliable data on overhead costs.

Lumbermen are beginning to study the prospective trade from the Pacific coast through the Panama Canal, having received rates and schedules from Oregon and Washington lately. These give the rate through the canal to New York as 40 cents per 100 lbs., and with an additional 13 cents per hundred to Buffalo by rail the total will be 53 cents, as against 68 paid now all-rail. The Erie barge canal ought to cut this 13 cent rate down considerably, so that there is a prospect that after the opening of the Panama Canal all Pacific Coast lumber will arrive here from the East.

For eleven days a city of Quebec jury heard the libel case of the Chicoutimi Pulp Company vs. William Price. The action was for $25,000, and arose out of a letter published in the Quebec "Chronicle," Montreal "Star," and Montreal "Gazette," signed by William Price, who alleged in his letter that part of his property in Chicoutimi Basin had been taken from him by the pulp company. The jury unanimously decided in favor of the defendant.

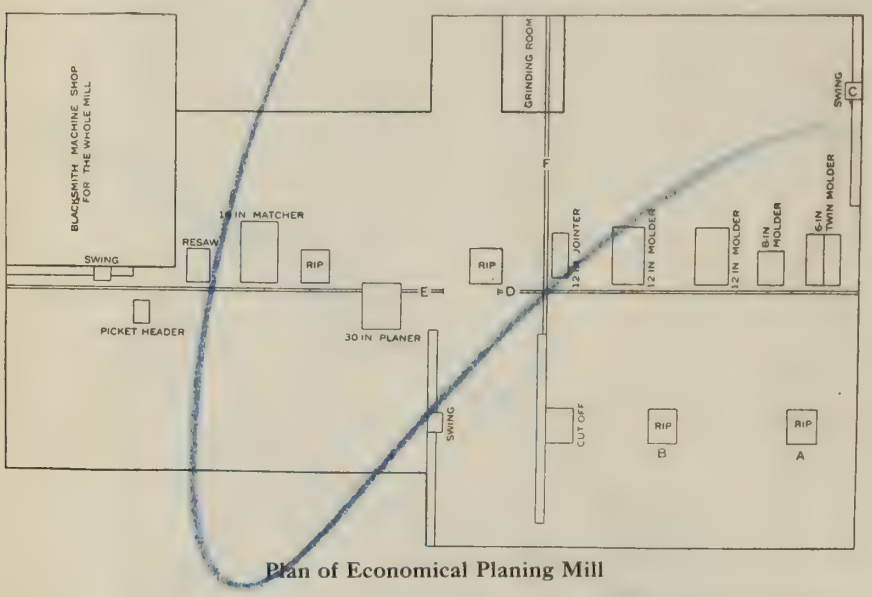
THE WOODWORKER

Plan of An Economical Planing Mill

An economical and practical planing mill plan is given in the accompanying illustration by S. P. in the Wood-worker. The main lineshaft is below the floor, placed in a tunnel 12 ft. square. All of the machines are run with belt-tighteners except the two rip saws, A and B, and the cut-off, C. Each is run by direct motor. The lineshafts, D and E, are run by two 30-h.p. motors. The lineshaft F is overhead and run by a half-twist belt from lineshaft D.



Plan of Economical Planing Mill

Shaft F runs a swing cut-off and a railroad cut-off, also the grinding room. Two 60-in. fans take care of the shavings; they are driven by a direct-connected motor.

The shop is well lighted, both with windows, skylights and swinging doors. The floor is of concrete, making an ideal machine bed, on which trucks are easily managed.

Discrimination in the Buying of Stock

By J. Mason in Wood-Craft

Discrimination or careful selection in the purchase of stock for manufacturing purposes does not mean that a man should buy the highest grade of stock on the market or anything of that kind. It is imperative that we understand this distinction at the present time because there is being offered to and urged upon the furniture manufacturers and other users of hardwood in various forms low-grade stock in hardwoods. It does not follow that because a furniture manufacturer, for example, buys and works up low-grade stock that he will produce an inferior article of furniture or even have inferior wood.

Grade of Hardwoods

The main distinction between low-grade and high-grade stock in hardwood is that mingled in with the good material in the low-grade stock is a lot of defects that must be trimmed out in working to make it clear. When these are trimmed out and clear stock is secured this clear stock is just the same as stock from a board that is clear all the way through. In other words, the clear stock and the low-grade quite commonly come from the same log, a certain percentage of one and a certain percentage of the other. The material is all the same. Indeed, if there is any difference it is probable that lots of the low-grade is superior in strength and of the finest grain, because quite frequently it is the interior or heart of the wood. Lots of the clear stock comes from the outside and is either sappy or close to the sap and consequently is more open than the interior of the tree. It is from this interior that lots of the low-grade comes. Of course, there is a lot of low-grade from the outside, trimmings from cutting timbers and ties.

Stock Cut to Specific Dimensions

Where a furniture manufacturer buys his stock cut to specific dimensions at the mill, discrimination in buying stock quite naturally implies buying the highest grade of material offering, because the stock is already trimmed to size and should be clear and of proper grain. Then the matter of selection is simply one of grading. However, when a furniture factory goes to buy lumber to be cut up and refined at its own plant then it is a different matter. It will be found here and there that certain kinds of defects may cause more waste than others or make it more difficult to get clear stock in the dimensions required.

It is seldom that there are any really large dimensions required in furniture making. No ordinary piece of furniture ever calls for a piece of clear lumber as large as an ordinary clear board. It may be as wide but it will not be full length. Consequently, one may either buy clear short-length stock or buy rough lumber that has knots or other defects and by trimming these out get clear short lengths, or small dimensions and when this is properly done the resultant product is, as stated above, just as good as if it came from an entirely clear board.

The main point for discrimination aside from that of selecting the kind of timber wanted is to discriminate in selecting such lumber as will cut the greatest percentage of clear stock into the dimensions wanted, that is to give one the most good stock for the same amount of money. It doesn't matter whether that stock is No. 3 common oak, No. 2, No. 1 or log run, by getting sample lots, making a note of the cost per thousand feet in the rough, trimming it up and measuring the exact amount of good stock gotten out of it for furniture and comparing this with the cost per thousand one can soon arrive at a demonstration of which is the best to buy. Of course, there must be taken into consideration the cost of doing the trimming and reducing to dimensions.

Utilization of Material

In following out tests or experiments of this kind, if the work is carried far enough, it may be found that stock from certain mills of an even grade with stock of other mills will work better because of the grade of timber or nature of the defects, and it is out of this knowledge, knowledge gained through careful attention to experiments with different grades and kinds of lumber, that one gains knowledge for use in buying lumber with discrimination. This knowledge is becoming essential, too, to the conduct of furniture and other factories consuming lumber now, because the great burden of the mill man is that of low-grade stock and more of this must be utilized in such work. Otherwise the price of the clear stock will have to be raised beyond the reach of many purchasers in order for the mill man to make a profit out of their stumpage.

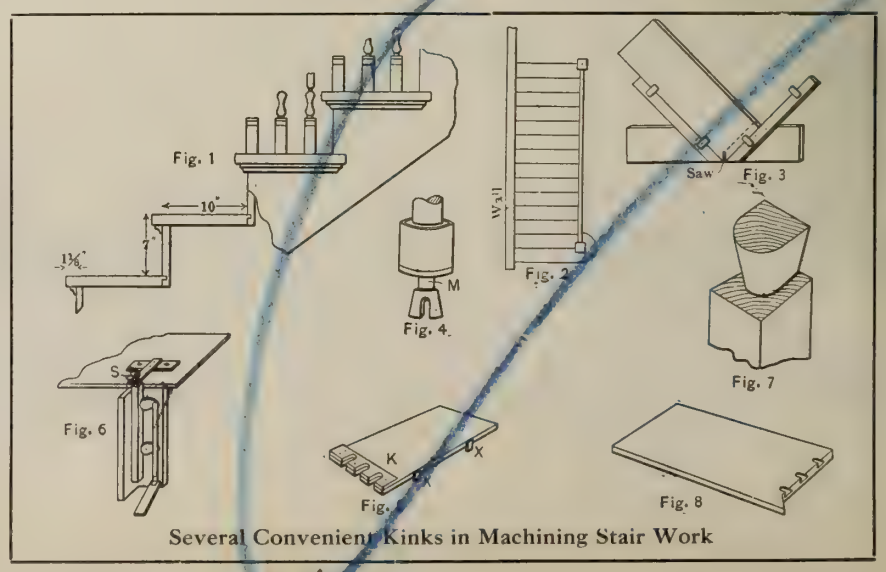
The great need is utility, devising ways and means to use every bit of our hardwood stumpage to the best advantage. We can do it by experimenting and carefully discriminating and selecting stock. They can do this and not only help the mill men but quite frequently the furniture manufacturer might be able to further his own interest at the same time.

The Planing-Mill Machining of Stair Work

By W. H. Bohr

There are textbooks on stair building and handrailing but they do not give details of machine work and many young machine men look to their trade journal for information along all lines of machine work.

I do not claim to introduce anything particularly new, but rather endeavor to give readers the benefit of my experience while employed in a big shop where I was called on to machine out work for the stair builder. Nor will I take space to cover all details—only offer a few that I think may be of the most interest and benefit.



Several Convenient Kinks in Machining Stair Work

Fig. 1 shows the plan of a portion of stairs using a cut and mitered outside stringer with treads having their ends mitered for return nosing. The lower part gives a detailed working drawing.

Fig. 2 is the ground plan. According to the ground plan there will be thirteen straight steps and one bull nose step; likewise fourteen straight risers and one bent riser.

Referring to Fig. 1 the pitch is seen to be 7 by 10 inches so that the net width of the riser according to this detail will be 7 inches. The back edge of the tread is rabbeted so that a 5/16 inch projection fits into the groove of the riser and the nose projects past the riser for 1⅛ inches. Therefore, the total width of the tread will be 11 7/16 inches. The tread finishes 1 1/16 inches thick; the riser ¾ or 13/16 inch and the cove is No. 8060, ¾ by ⅞ inch. Now these treads must be mitered for the return nosing, which will be the same width as the front projection, or 1⅛ inches. Referring to the ground plan, Fig. 2, it is seen that the right hand side going up is the end to be mitered for the return nosing. Then this end of all the treads should be trimmed square and one tread laid off and adjusted in the form, Fig. 3, for cutting the miter. This form can be clamped on a sliding table trim-saw or a universal saw with gage running in a groove. Anyway it must be on a trim-saw that can be adjusted for depth of cut.

After all are mitered they may be, by the use of a stop block or gage, trimmed up on the dotted line, see Fig. 3, as far as a circular saw will go without cutting past the miter, then finished with a hand-saw. Now they are ready for dovetailing.

Plan in Fig. 1 shows three balusters per tread, so lay off one accordingly. There are different methods of dovetailing treads, necessarily so on account of different machines. I used a regular stair router, having a bit like Fig. 4, above which was a double collar, the outer shell being loose, and thus prevented friction and wear when in contact with guides or forms.

Getting Dovetails Rightly Placed

To bring the dovetails in the right place I made a form like Fig. 5, the recesses of which coincided with the layout of balusters on the end of the tread. The recesses were just wide enough to admit the collar above the bit. They were 2 inches wide in this case, and cut back 2½ or 3 inches, then a little stop block was nailed underneath to gage the depth of the dovetail from the end of tread. Two little blocks XX were tacked on the side for the edge of the tread to come against.

This form, of course, fitted down over the tread and the two were held in place on the table by a large screw clamp, one end of which was fastened under the table and the screw tightened down on the form at about K, see Fig. 5.

Now if turned balusters were used the turner turned a dovetail on the lower end of each of them and the cut in the end of the tread was made to fit this; but if square balusters were chosen I cut on the dovetail with the same bit by holding the baluster in an upright position as in Fig. 6. This figure is practically self explanatory.

The apparatus holding the baluster in position is operated by the foot. The guide bolted to the top is made of iron ½ by 1¼ inches. The height of the baluster may be adjusted by the little set-screw S. Fig. 7 shows the end of a baluster dovetailed in this manner.

When balusters are dovetailed the shank of the bit marked M comes in contact with the iron form.

Fig. 8 shows a tread completely machined.—Wood Craft.

Proper Shape of Gullet for Band Saw Teeth

In the many articles I have read concerning the care of band-saws, occasional mention was made of the shape of the gullet for chambering the sawdust, etc.; but seldom or never has the shape of the teeth been considered as having much to do with causing cracks, writes R. Carleton, in Berlin Quality.

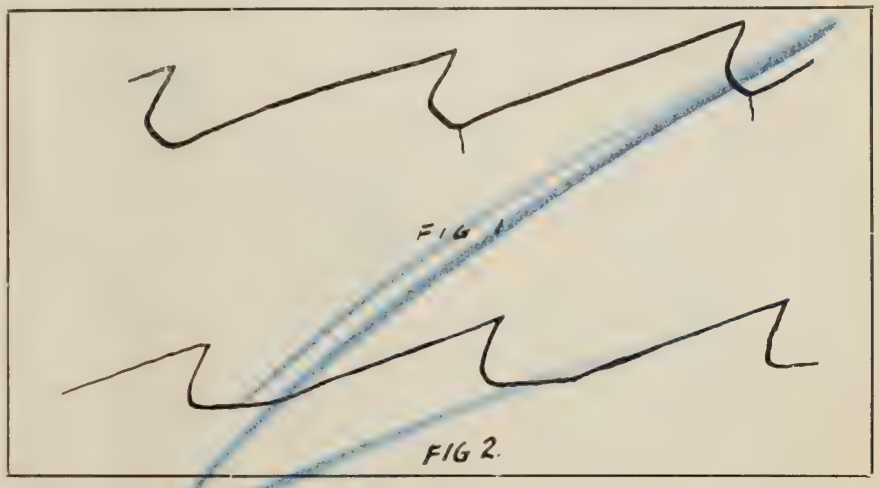
The purpose of this article is not to claim that any shape of tooth cannot be successfully used under certain conditions, providing that the tensioning and levelling is properly done, for we all know better; but under certain abnormal conditions where a saw would be almost certain to crack, one shape of tooth will bring a saw into the filing-room, nearly or quite useless, while another will nearly always save it for many more runs.

Now, here are same instances of abnormal conditions which have come to my attention: Two resaws with 54 in. wheels carrying a 6 in. blade, 19 guage, with the speed of the wheels varying from less than 400 r.p.m. to 580 r.p.m., (owing to lack of power in the engine-room) gave a tooth-speed varying from 5,600 ft. up to 8,000 ft. per minute. On one machine the face of the bottom wheel was flat while the top wheel was quite heavily crowned and worn off slightly in front. On the other, both wheels were slightly crowned, worn full of hollows and also worn off in front so that it was hard to find any two places which looked alike under the straight-edge. Of course, these things should be remedied, but it is not always possible to get this done. The stock which these machines were handling varied from pieces of white pine one inch thick to pieces of fir, spruce, hemlock, and some poplar. The width of cut was about thirty inches, so that it seems as though the conditions were certainly abnormal enough to cause lots of cracks.

I will illustrate one shape of gullet which was almost sure to come off from the wheels in such condition that the filer would tear his hair, the man who buys the saws would say things, while the man who sells them would smile sweetly, for business is good. Here is a sketch of the tooth. Note the location of the cracks; they will almost invariably be in the same place, so you will know where to look for them.

I will now give another sketch of a gullet where, under the same conditions, if you have any cracks at all, they will be very few and far between. I will also try to give you the reasons for this difference.

I think that all of my readers will agree with me that a band-saw would stand a great many times the strain to which it is subjected, providing it was not continually bent and straightened, and



that it is this bending action of the steel which causes the cracks. In the first cut you will note that the cracks nearly always occur at the very bottom of the gullet where the blade is narrowest, and therefore will bend the easiest. This concentrates the bending strain at one particular spot, and of course, will crack the blade right there and in no other place. Does this not sound very reasonable?

You will note that in the second cut, the bottom of the gullet is flat and is carried flat as far as possible but still leaving enough steel to build up a fairly strong back on the tooth. My reason for this is, of course, that the bending strain of the steel will not be localized, but will be distributed over the length of the flat part of the gullet, so that the bending circle will be that much less abrupt and therefore, just that much less liable to crack.

What is sauce for the goose is also sauce for the gander, and if under the conditions mentioned the flat gullet will not crack, why is it not a good shape to use when your machines are in good condition and you have no solid 30 in. hemlock to saw and everything else is right accordingly?

Some Troubles of the Molding Room

By M. C. Cantrell

Though much has been said through these columns about molding room work, and the best way to do certain things gone over at length, I have seen no story from the "trouble" man in this line. Unless the stickerman himself has contended with the conditions under which different shops are managed, he will probably be surprised at the innumerable things that arise.

Some mills furnish all stock to the molders sized in both width and thickness. This reduces trouble to a minimum. It often avoids the necessity of setting or running the bottom head, belts will do the work and run very slack; knives stay sharp much longer, and bearings remain snug, run cool and last much longer. No unusual strain is placed on the feed rolls and gear, and cross-grained stock does not tear badly. As to the advisability of sizing stock to such an extent, it depends largely on the kind of wood being used, the class and quantity of work. In working hardwoods, close and accurate sizing is an absolute necessity. The cutters will not remove unusual amounts of stock, and, if they would, a much greater per cent. of stock would be spoiled, and stock is more valuable than time.

In the strictly detail, or local shop, surfacing and sizing are necessary for best results, regardless of the kind of wood being machined. Here is where trouble is more or less a stranger, because each machine is operated by a regular stickerman, who, as a rule, heads off trouble before it gets there. The runs are short, allowing little time for bearings to heat; stock is kept cleared away without trouble, and little or no worthless stuff gets into the business.

But go into a large sawmill of, say, a capacity of 350,000 to

400,000 ft. in ten hours. Note the stuff as it is sorted and distributed, follow it down to the dry-kilns, and wonder, down in your heart, "what in thunder" they are going to do with certain cars of seemingly worthless stuff. At the opposite end of the battery of kilns you will find a big planing mill. As these cars of junk come out, they go on a transfer and pass down the line. You go into the planing mill and see some one loading edgings of all shapes and sizes on a horse truck. Some one else is loading all the stuff that is so crooked that it will not go through a matcher. "Bullheads" and thin stuff go on another truck, and they all go in the direction of the kiln car.

From the planing mill you go into the cutting room of a big sash and door factory, and see a busy gang planing, ripping, cutting and resawing, sorting and resorting. A few more trucks are being loaded with what is left after the factory gets all it can use out of it. Follow those trucks a short distance, and they, the kiln cars and the planing mill "leavings" join " company." Go around the aggregation (for as a rule you cannot go through), and you will find the molding mill.

Here one may witness the process of making moldings, trouble, and—gray hair. Five, six, eight or ten machines will be grinding out stuff, in quantity from a dozen to 50,000 feet of a kind, in size from ¼ x ¼ in. glass bead to 6 x 6 quarter-round or gutter or 3 x 14 crown. All this does not come from odds and ends, mind you; it is necessary to have a large part of the stock from the mill's best product. But to the edgings from every other place are added those of the molding room rip saws. Everything from ⅜ x 1 in. up, and 6 ft. in length and over, is saved; and often as short as 16 inches. Stock 6 ft. and up goes into orders. When running O. G. and parting stop, drip cap, blind stop, and some patterns of beads and crowns, brick molds, back bands, etc., we save them down to 2 ft. for the frame department. Squares from 1½ in. up, and 16 in. in length and over, go to the turning department. As large quantities of moldings are used on doors, we throw nothing out, when running them, that will cut a clear piece one foot long.

But that trouble. Here the machines have feeders, and not stickermen, and all the rest is up to the foreman and his helper (if he has one). The market of a concern of this kind begins in its "door yard" and extends to the outermost corners. Orders come in made up from every molding catalog known to man since Adam. To these are added numerous mongrel details from the befuddled brains of would-be architects. Then some yard man tries his hand and sends in a free-hand sketch that would digsrace the birch-bark production of a Mohican pappoose. All these are neatly pinned to the order and go to the foreman for his interpretation; and knives are to make accordingly.

These cutters are kept for several months and then changed to another detail, thinking they will be needed no more, and the next day the old customer comes back for 200 feet more, thoughtfully mailing a sample cut from the end, with part of it "minus." Yet we have a genuine good feeling toward that fellow, for he was trying to be kind to us. But from the architect or contractor who will send in a bunch of cross-eyed details for the "Jones" job, and in about eighteen months send another order, and without even specifying sizes, say, "same pattern as 'Jones' job," may the good Lord deliver us.

While we are out in the grinding room trying to decide which is the "face" of some of those "mishaps," making cutters and eating emery dust, the rip saw gets a bunch of tickets and attacks the aforementioned stock. As there are so many widths and thicknesses of this stuff, it is entirely impracticable to size both ways, or either way when it can be avoided. So, when getting out stuff to finish 13/16 x 1¼, it is very common for strips to go to the machine 2 in., even 2¼ in., at one end, and 1½ in. thick part of the length. Now, that makes trouble. We must use sizers—straight knives that cut through to the bed, cutting away all but about ⅛ in. for the side head to remove. This gives the top head an overload, which means that belts must be stretched to a maximum, and hot boxes are in order—unless everything else is in order. That particular thing, however, is the smallest of our troubles.

The feeder will start a "bullhead" in thin end first, without knowing, possibly not caring, just how thick the back end is, and the piece either sticks in the feed rolls or chokes the top head down, and the foreman or helper must go and get things straight. By this time another fellow has the pressurebar "scratching," and, if left alone, it is dollars to doughnuts that he will get it too tight or too loose. This done, some one else has a piece "jammed," and is either riding the weight lever or using a piece of 8/4 stock trying to drive it through. We get there and find any one of half a dozen causes. And, strange as it may seem that any feeder would be so stupid, a head will be choked and the belt literally be burning up around the pulley. Yet he has not the least idea why the old thing won't go. Maybe a sliver has come loose and wedged on the under side; or, if the stock is quite damp or green, a bunch of fiber has accumulated in the crotch of the bed and rail. The same thing may have happened on the back side of the bottom feed roll.

By this time "Bill" has put the big end of a "bullhead" in first and it hung up against the chipbreaker. When he finds out the trouble he holds the chipbreaker up for half the length of the piece, making beautiful cross-scallops. The back end is so thin it won't feed, and he doesn't know enough to put a thin piece—sliver, anything—on it, under the feed roll, and let her go. Now Dick comes over with a broken side head belt; you get it repaired, he puts it on, and when he starts up you know from the sound that he is running the head backwards.

You smell a hot bearing by this time, locate it, and the feeder will swear that he oiled it only two minutes before. If he did, it was on the outside. And right here I want to say that more machines go to the "deminition bowwows" through improper oiling than any other one thing. If one-half the oil that goes into the can went through the bearing properly, there would be less trouble.

However, you straighten up, look toward Dick again, and see him trying to ram a strip through his machine by hand. It was cross-grained and had split and jammed under the pressure-bar. You get him going, get back in the grinding room, and begin laying out work for another day. Just then Harry rushes in and wants a tomato can full of rosin. He has started on a run of 4 x 6 gutter, and the belts won't carry the load. Pete has a loose bearing, and Jack's cutters are dull. By the time these little things are over with, three or four machines finish the run and are ready for a change, within two minutes of the same time.

As the foreman and helper can do only two men's work at a time, the feeders take advantage of the occasion and take a hike for the hydrant and other places. And right then you may bet your old clothes that the "Old Man" will stroll in and want to know if you are running that day. Before you can get the string going again a cutter on one of the remaining active machines develops a nick and is "down and out" until you can get to it.

At last all machines are going, some of them on items requiring several thousand feet of stock, and before the run is finished stock runs "shy." Then it's wait or change the set, either of which is unprofitable and looks bad in the daily report. Occasionally you get the entire string going on a full day's run, and by the time you have patted your own back, a rush order is brought in that must be shipped at 2.50 p.m. While making the best of a bad occasion, a cross-grained "heel" comes off under the top head of No. 6, and the next few pieces are fed up the blower pipe.

At this moment the devil breaks loose up in the fan housings, and the whole shop must be shut down long enough to unravel a pair of cast-off overalls from the fan. The crew is lined up, and every mother's son of them will swear that he never owned such a pair in his life. This last is not a common occurrence, but it does happen occasionally. Fire the feeders, you say? What's the use? The next ones will be as bad, or worse. And should you be so fortunate as to get one with enough "gray matter" to avoid these troubles, he will want as much salary as you are getting, or he will leave you. And down in our heart we don't blame him.
—The Wood-Worker.

Drying and Handling Factory Lumber

By Chas. D. Gifford

Inasmuch as you can't make a silk purse out of a sow's ear, it is impossible to make a first-class piece of furniture or other wood produce out of imperfect material. No matter how good your machines are, no matter how skillful your cabinetmakers, nor how well the finishing is applied, you must have the material to begin with in order to get thoroughly satisfactory results.

The cost of labor and machining is, of course, the greater part of the selling price of any article, material, the basis of these operations being a minor factor as far as cost is concerned. This only emphasizes the importance of having your lumber in good condition for working, for the spoiling of the material is less important than the waste of labor and time involved in putting it through the manufacturing processes.

A whole lot of knowledge has been added to the sum total on the subject of drying lumber within the past few years, though it is safe to say that there is still a good deal to be learned. The seasoning of lumber after it has been received by the consumer and the final process of kiln-drying which precedes its movement to the saws are so important that the treatment of the material should be carefully regulated by the manufacturer, and not left to chance or to a rule-of-thumb system which does not take into consideration the varying problems presented by different kinds of lumber.

The air-seasoning of stock is so valuable a consideration that it is almost folly to rush a car of lumber into the kiln without giving it a chance to dry out in the air. Sun, wind and the other natural elements do more to season lumber thoroughly than anything else can

do, and the time that the lumber is piled in the yard is by no means lost.

When lumbermen sell material to consumers they may guarantee it to be "bone-dry," but taking into account human fallibility, it is always well not to assume that the stock is ready for use, but to give it several months seasoning in the yard before attempting to make use of it.

The tendency on the part of many consumers has been not to carry large stocks of lumber, but to buy in smaller lots. One effect of this has been that a shorter time has been allowed for the lumber to dry out after it has been received. This is unfortunate, but makes the necessity of careful treatment before the material is cut to dimensions, and preparations made to put it into the work where it is to remain permanently, all the more apparent.

While, as an average, it would be better to dry lumber from six to twelve months before using it, this is often not possible. Therefore, the time that it is allowed to remain in the open should be taken advantage of to the fullest extent. Piles should be not more than six feet wide at the most, so that the air will have a chance to get at each board. The individual pieces should not be placed too close together, and the layers should be separated by strips.

These strips should be laid close enough together to prevent the boards from sagging. For instance, it was noticed recently that a large consumer of lumber had 12-ft. boards piled with only three strips in use, sections 6 ft. long therefore being unsupported. This was causing the stock to sag and giving promise of trouble in the future. It was found advisable to take the pile down and put the stock up with four strips instead of three, so that the sections which carried the weight above would consist of only 4 ft. instead of 6 ft. A marked benefit followed this change.

Piles should not be placed too close together. Several feet should intervene between them, for not only does this aid in hastening the seasoning process, but is advisable from other standpoints, such as that of fire prevention.

The universal use of dry-kilns is ample testimony of the efficacy of this form of drying, and undoubtedly by using a good kiln a woodworker is enabled to do business with much smaller stocks than would have been the case under the old conditions, where air-drying alone was in vogue. Quick drying makes it possible to carry smaller stocks and thus to have a smaller working capital than was formerly necessary. This is an important consideration, and one that the dry-kiln manufacturers have reason to emphasize.

A half-way point between the dry-kiln and the yard is recommended by some lumber users, however, this being an inclosed shed which is kept at an even temperature of about 70-deg. Even where no attempt is made to heat the shed artificially, benefit results from the protection from moisture, though this is discounted, in the opinion of others, by reason of the fact that the sun is shut off and less air can circulate than in the case of lumber stacked in the yard. But if lumber can be gradually dried out at relatively low temperature, it is probably fair to assume that better results will be obtained than if the drying process is too rapid.

As a matter of fact, the competition between advocates of various dry-kilns is probably responsible for much of the over-quick drying which is occasionally in evidence. Each kiln man promises that his proposition will enable the lumber to be prepared for use in shorter time than any other type of kiln, and in order to have this result accomplished the tendency is to recommend the use of excessive heat.

It goes without saying that an extremely high temperature in a perfectly dry atmosphere would kill the life out of the best lumber in the world. If the kiln is kept heated to a temperature of 160 deg., say, the point at which some users of wood maintain their kilns, and the lumber is not pretty thoroughly seasoned when it goes in, the the result will certainly be case-hardening, imperfect, drying and probably checking.

In order to anticipate such a result, there are a good many consumers of lumber who make a point of supplying moisture to the kiln by condensing steam from the pipes and allowing it to fill the chamber. By a system of drafts the air is kept circulating and the humidity does not become too great. The pores of the lumber are kept open, so to speak, and case-hardening is obviated. The drying process is probably slower this way than otherwise, but this is a time when haste makes waste.

Some users of lumber do not favor the use of a temperature around 160 under any circumstances. They assert that they prefer to take a longer time and have better lumber. They maintain their kilns at about 120 deg., and by a comparatively slow and gradual process dry their lumber without the danger of creating too rapid a change in the condition of the stock, such as would be likely to result in its becoming too hard and brittle.

Following the drying process, it has been found an excellent plan to allow the stock to "anneal" for several days before use. Driving the moisture out of lumber causes it to contract, naturally, and it is well to give the lumber time to allow its pores, emptied of their moisture, to gradually expand before cutting it or attempting to work it. The period that the annealing process is permitted to continue varies with the thickness of the material and with the heat to which it has been exposed. If 1-in. stock has been heated to a temperature of about 140 deg., say, four or five days should be given it in which to recover its normal condition.

All lumber contains some moisture, and if stock which has just come from the kiln is worked and put into a piece of furniture or a veneered product, the tendency is for it to absorb moisture at the first opportunity. Drawers which "stock" and which cause the "ultimate consumer" to vow never to purchase furniture from So-and-so, or under a certain manufacturer's trade mark, are usually traceable to the use of lumber which has been quickly dried and then cut to size and worked up into the article for which it is destined, without being given a chance to expand. The importance to the user of the commodity in which the material is placed of having only thoroughly seasoned and properly dried lumber worked up, is plain, and the manufacturer owes it to himself as well as his trade to get rid of even the possibility of dissatisfaction on this score.

A prominent consumer of lumber said recently in conservation with the writer:

"The tendency on the part of a good many of us, and I do not except myself altogether, is to use too much heat in drying our material. We are too eager to get the use of the lumber, and don't give it a chance to show its best qualities. I suppose the average buyer and user of lumber blames the lumberman because the stock comes to him green, and promises himself never to buy from him again, if in kiln-drying it, it happens to become case-hardened.

"Instead of taking this view of it, it would be far better to assume that the stock is not thoroughly seasoned, and to give it a chance to dry in the open air, where the sunshine and wind can do their work, protecting it only by a roof which will permit the sides and ends of the lumber to be exposed. A little wrinkle here, by the way, is to pile the lumber with the longest boards at the top, so that the rain will not drip off onto the lower ones. When the stock is put into the kiln, use too little rather than too much heat, even if it does take more time. Gradual drying certainly beats too rapid driving out of the moisture.

"When we are paying $75 for quartered-oak lumber, there is no sense in turning it into cheap stock because we are too impatient and need the lumber. It would be better to carry somewhat larger stocks rather than attempt to rush through the kiln the smaller quantity, in an effort to make use of the lumber as soon as it reaches the yard."

In order that exact facts may be secured as to the lumber, it is well to mark every pile that is stacked with the date it was put up and the quantity of lumber it contains. In this way it will be easy to determine about when it is safe to use the material, and as to the approximate treatment it should be given in the dry-kiln. The stock that is thoroughly seasoned can take a higher temperature than that which is still green, and, on the other hand, the amount of moisture which is kept in the kiln can also be better determined when the age of the stock is arrived at.

In buying lumber it is usually impossible to get the seller to state the age of the stock. Every lumberman thinks the seller would willingly part with the information, which would be worth considerable to the user, for he would then be prepared to determine the period that the lumber should remain in the yard and the proper method of handling it in the kiln.

Speaking of drying lumber, it is well to have stacks piled in the yard, with plenty of room underneath. Too many users of lumber put their stock almost on the ground, and under these conditions it is almost impossible to dry the boards on the bottom. It is best, if possible, to place the stacks on concrete foundations, and if these are not practicable, substantial foundations of wood which will lift the pile sufficiently high above the ground to enable plenty of air to circulate and prevent the earth damps from permeating the lower sections of the pile.—The Wood-Worker.

The Winnipeg Branch of the H. W. Johns-Manville Company, owing to their fast increasing business in asbestos, magnesia and electrical supplies, has found it necessary to move into new quarters at No. 92 Arthur street, Winnipeg. This is a six-storey and basement building, 100 feet deep and 50 feet wide, and will be occupied throughout by the company's offices and store-rooms. By reason of this move, a much larger and more complete stock of goods will be carried on hand than heretofore, and a larger force will be employed to look after the company's interests.

A big forest fire did considerable damage to the property of the Columbia River Lumber Company, at Golden, and threatened that town with destruction. Camp 14 of the company was burned, with 50,000 feet of logs, but fortunately not much damage was done to the standing timber.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

Wanted

For delivery beginning in three weeks, finishing in six months, 300,000 feet 3-in. sound square edge beech,. f.o.b. Montreal. Reply "G" Builders Exchange, Montreal. 12-13

White and Red Pine Wanted

3 in. x 6-in-7-in. 18 ft. Tank Stock, also Quarter Cut White Pine Pump Squares.

Ontario Wind Engine & Pump Co., Ltd.
Toronto, Ont. t.f.

Basswood Lumber

We will purchase Basswood Lumber, 1-in. and 1¼-in. thick, white stock by car or entire stock. White us what you have and what you want for it.

Box 498, Canada Lumberman, Toronto, Ont. 11-15

Basswood Lumber Wanted

We will purchase Basswood Lumber, 1 in., 1¼ in., 1½ in., 2 in. thick. Write us what you have and what you want for it.

CANADA LUMBER SALES CO.,
N. B. 416,
Dominion Express Bldg., Montreal.

Trimmer Ends Wanted

Price and freight rate permitting we will contract to take your White Pine Trimmer Ends, rotten pieces thrown out, fresh stock and not colored. Write price per cord on car and state shipping point.

The Wm. Cane & Sons Company, Ltd.,
11-17 Newmarket, Ont.

FOR SALE—LUMBER, ETC.

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co., Ltd., Toronto, Ont. 7-tf

For Sale

To the manufacturers: Birch, Maple, Basswood and Elm in all thicknesses. Send us your enquiry. The Meaford Lumber Company, Meaford, Ont. 7-20

For Sale

100 M. ft. 2-in. Cull Spruce. 300 M. ft. 1-in. Cull Spruce. 15 M. ft. 1¼-in. M. C. White Pine. 50 M. ft. 2-in. M. C. White Pine. Fred T. Smith, 310 Board of Trade Bldg., Montreal, Que. 1.t.f.

Lumber For Sale

4 cars 1-in. good cedar for boat building.
100,000 ft. 2 x 6 mill run hemlock.
100,000 ft. 2 x 8 mill run hemlock.
4 cars 2-in. white oak, sound and square edge. Apply to Geo. C. Goodfellow.
c Montreal, Que.

Long Piling For Sale

200 to 300 red pine piles for sale, 50 feet long and up to 70 feet. Immediate shipment.

J. SHEPPARD & SON,
10-13 Sorel, Que.

WANTED—MACHINERY, ETC.

WANTED—Good second hand Wickes gang, 18-in. cut; must be of modern construction and in good operating condition. Advise with full particulars. Graves, Bigwood & Co., Buffalo, N.Y. 13 T.F.

FOR SALE—MACHINERY, ETC.

Belting For Sale

1,000,000 ft., all makes and sizes. Pulleys, Shafting, Saws, Iron Pipe, Roofing, Steel Cables, 200 tons Relaying rails, etc. Write us for prices, stating requirements.

Imperial Waste Metal Company,
11-14 150 Queen Street, Montreal.

Machinery For Sale

A Waterous No. 4 Band Saw Mill, with Carriage Saws, Live Rolls, and complete Filing Room equipment, also several Good Woodworking Machines, in splendid condition.

J. S. FINDLAY,
2-TF Owen Sound, Ont.

Saw Mill For Sale

On Georgian Bay, adjacent to North Shore, good two-storey circular mill in good running condition, double edger, trimmers, capacity about 12,000 feet per day; plenty timber available and ready sale for slabs; splendid opportunity for small millman; will be sold cheap as owners have other interests requiring their attention. Box 444, Canada Lumberman, Toronto, Ont. 5-TF

For Sale

Sawmill, in good condition, on Burford Lake, six miles from Wiarton, equipped with 70 H. P. boiler, 60 H.P. engine, new carriage by Long Bros., Orillia, Ont., good trimmers and endless chain attachment for hauling logs out of water

Terms, etc., apply Massey-Harris Company, Toronto. 4-T.F.

Whitney Saw Mill For Sale

We offer the Whitney mill at $25,000 as it stands. This mill is equipped with good heavy machinery and is in good repair. Cost when new $170,000.00. Has three single cutting nine foot band mills and one nine foot band re-saw. Three edgers, trimmers, lath and picket mill, shafting, pulleys, belting, etc. 750 horse-power Engine with battery of eight boilers, 6 ft. x 20 ft. Machine shop, refuse burner, sprinklers, lighting plant, etc.

WANTED—EMPLOYMENT

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

Young man, 30 years, requires position in lumber trade, 12 years' practical experience as manager, salesman, full knowledge of all trade calculations and office routine, etc. W. L., 119 Board of Trade, Montreal. 13

WANTED—Position as Bookkeeper and office manager with wholesale lumber firm. Ten years' experience; competent to handle all of a lumber office work. Best of references furnished. Apply Box 521, Canada Lumberman and Woodworker, Toronto, Ont. 13-16

Timber Estimating

Roads and limits surveyed, water powers examined. Any kind of Forest Engineering. Many years experience. Know the West well. Good references. Charges moderate.

E. B. NAGLE,
191 Augusta St.,
10-13 Ottawa, Ont.

Position Wanted
in Western Canada

Position as superintendent or general superintendent in Western Canada by an up-to-date progressive lumberman who has the ability to organize and build up his organization and get results. One who has been through the big White Pine Mills in Wisconsin but is now in the South. No question as to ability and determination to make a success. Reply Box 495, Canada Lumberman, Toronto, Ont. 10-13

WANTED—EMPLOYEES

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

WANTED—Good planer hand, also man for large Band Saw. Apply M. Brennen & Sons, Hamilton, Ont. 13

WANTED—A good man to saw out about 1,000,000 feet of Hardwood Logs this coming fall and winter. Apply Box 519, Canada Lumberman, Toronto, Ont. 13

Wanted quick engineer to operate log jack and loading hoist. Steady work for good man. Holt Timber Company, Whitestone Post Office, Ont. 12-13

Wanted a man, competent and reliable, to oversee the manufacture and grading of lumber. Saw mill at Toronto. Holt Timber Company, Whitestone Post Office, Ont. 12-13

Wanted

Thoroughly competent saw filer for mahogany and hardwood mill, experienced man for slicing and rotary veneer machines.

Circular sawer for edger.

Apply 119 Board of Trade Bldg., Montreal, Que.

WANTED—Yard foreman for retail lumber yard furnishing contractors, in South Western Ontario. Must be active man, not afraid of work. Wages to start $2.50 per day, with a possible raise to $18 per week. State age and experience. Box 520, Canada Lumberman, Toronto, Ont. 13

Buyer Wanted

Wanted—Hardwood Buyer and Shipper for Ontario. Must have a knowledge of grades and values and a knowledge of road work. We want a good live practical man who will guarantee to make good. No boozer need apply. Will pay large salary to right man. State age and experience. Must have highest references. Strictly confidential. Reply Box 487, Canada Lumberman, Toronto, Ont. 9tf

Reporter

We want an energetic representative in each town in Canada to report on building and engineering work—to tell us where machinery, equipment, supplies or materials may be sold. Reports are paid for on the per item basis. It depends upon your own efforts how much you make. This is a profitable side line and there is good money in it for a hustler. Write to MacLean Daily Reports Limited, 220 King Street West, Toronto.

BUSINESS OPPORTUNITIES

For Sale

Planing mill, well equipped with modern machinery, doing good business. Ill health only reason for selling. Reply J. S. Richardson, Tillbury, Ont. 12-15

Timber Limit For Sale

1,200 acres Hardwood, Hemlock and Cedar. Some Pine; 9 million feet for $5,000 cash. Five miles from railroad; two from river. Box 431, Canada Lumberman, Toronto, Ont. 6-t.f.

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

For Sale

The best equipped planing mill in Northern Ontario in fast growing town. Also lumber yard in connection. Splendid opportunity for live man with some capital. Owner retiring from business. Apply Box 522, Canada Lumberman, Toronto, Ont.

For Sale

Established Lumber Business, with first-class mill, now running full time. Timber limits with 20 to 30 million feet of standing pine timber conveniently located, and all merchandise, etc. Price $55,000. This is worthy of investigation. Address Box 332, Canada Lumberman, Toronto, Ont. 19-22-t.f.

Timber Limits For Sale

Two sections, 1,280 acres timber, about fifty miles from Nelson, B. C., one mile from railway; about 12,000,000 feet saw timber, 5,000 to 6,000 poles, and considerable tie timber. Road from railway to limits. Must be sold immediately. Offered at great sacrifice. Apply J. R. McDougall, Trail, B. C. 13

WANTED—Owner of good Portable Mill or Two, to take an interest with us in 4,000 acres spruce and birch timber tract in Quebec. Fine mill sites on two streams, level road to station—three miles—good and ready sale of lumber. We own the timber but want experienced man to take contracts from tree to train.

Tenders for Pulpwood Limit

Tenders will be received by the undersigned up to and including the 15th day of August next, for the right to cut pulpwood on a certain area, situated on the Abitibi Lakes and River, tributary to the Grand Trunk Pacific Railway, and the Temiskaming and Northern Ontario Railway, in the District of Temiskaming.

Tenderers shall state the amount they are prepared to pay as a bonus in addition to dues of 40 cents per cord for spruce, and 20 cents per cord for other pulpwoods, or such other rates as may be from time to time be fixed by the Lieutenant-Governor in Council, for the right to operate a pulp mill and a paper mill on or near the area referred to.

Such tenderers shall be required to erect a mill or mills on or near the territory and to manufacture the wood into pulp and paper in the Province of Ontario—the paper mill to be erected when directed by the Minister of Lands, Forests and Mines.

Parties making tender will be required to deposit with their tender a marked cheque payable to the Honorable the Treasurer of the Province of Ontario for ten per cent. of the amount of their tender, to be forfeited in the event of their not entering into agreement to carry out conditions, etc.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

W. H. HEARST,
Minister of Lands, Forests and Mines.
Toronto, Ont., May 15th, 1912. 11-15

Mahogany and "Mahogany"

Circular 185 of the United States Forest Service, states that there is a consumption of 40,000,000 ft. a year passing on the market as mahogany, whilst the annual cut of genuine mahogany is only 18,000,000. The question, then, is what are the other 22,000,000 feet made up of? The same report states that "Colombian mahogany is not even a member of the mahongany family. There is, however, a resemblance in the color and grain which has made the substitution possible." The report further states:—

"The physical properties of the wood are analogous to those of the true mahogany. It does not exhibit true annual rings of growth, which is a characteristic of the true mahogany.

"When properly seasoned it does not warp, check or shrink, and a great deal of the lumber has a beautiful figure and is susceptible of a high polish. It is hard and heavy, is strong and tough, and in color and weight compares almost exactly with genuine mahogany. The main objection to the lumber comes from those who actually work it. They complain that it dulls saws and other tools quickly. A microscopic examination showed that this is the result of an abundance of crystals of calcium oxalate and calcium carbonate."

Apart from the question of nomenclature, the report shows a strong sidelight on the wood when compared with the generally recognized true mahogany. Notice the main objection of the workers—what can be more forcible? Whilst the workers may not be able to give utterance in scientific terms, they possess an intuitive knowledge which frequently hits the point, and when wood dulls the saws, etc., it at once becomes more costly to work, and thus its inherent qualities discount its value. The report says that when properly seasoned it will not warp and shrink; but here, again, this class of so-called mahogany is at a disadvantage, as it is more difficult to season, owing to excessive moisture, and apt to check in the process than the actual mahogany. Apart from the foregoing drawbacks, there is also the question of the variability of color, texture and density of much of the wood shipped as Colombian that one is inclined to think all of it is not of one genera. To give the wood a reasonable trial more care should be exercised in its selection; as it is at present shipped it is only an abuse of nomenclature. This applies to many other sources of supply, and there is too much shipping some other wood and calling it mahogany, but in the long run it only recoils upon the shippers when woods come forward under an alias. Whilst buyers are willing to try unknown shipments to see how far the wood possesses the essential characteristics of mahogany, they will not pay true mahogany prices in future when they have once tested such shipments if they find them lacking in the primary essentials. One of the greatest charms of Honduras mahogany is its general uniformity of color and texture, and if any wood is to compete with it, it must in some measure possess some uniformity, hence the need of more care in shipping wood under the name of mahogany. It is extremely unsatisfactory to buy a dozen logs of so-called mahogany to find there are three or four distinct botanical varieties. Notwithstanding the many sticklers as to what is genuine mahogany, we venture to doubt if any practical agreement could be arrived at by any convention of experts. In these days of high prices it is the shipper's own fault if the consignment does not pay. Any wood, to make a market, must be carefully selected for what it is, or professes to be, and if this primary condition is observed the wood will find a place in commerce, especially considering the high prices current for the recognized varieties of mahogany. We believe that whilst the wood shipped as "Sapeli mahogany" is not really a mahogany in any sense, yet by its general uniformity of color, texture, and manufacture, it has attained a most enviable position, and finds a distinctive place in commerce. There are many other woods from the tropical forest which, with more care in selection and manufacture would also become standard woods.—Timber Trades Journal.

Uses for Sawdust

Many uses have been proposed for sawdust but one of the purposes to which considerable sawdust of the United States is devoted is the manufacture of oxalic acid. A number of patent processes for the production of this acid from sawdust or similar by-products now exist. Several of these plants have been started in various parts of the country.

The sawdust is treated with strong soda or potash lyes and exposed to the action of air at certain temperatures. The wood fiber is destroyed and certain reactions take place between the lignene and the lyes, which result in the formation of oxalic acid. The final product is leached with water and the oxalic acid crystallized out.

The entire supply of commercial oxalic acid has in the past been imported into the United States but in order to encourage the establishing of factories for its production the last Congress placed a duty of two cents per pound on the imported article.

Aerial Ropeways for Timber Haulage

Aerial cableways have been used for many purposes and with varying success in different parts of the world, but probably unique in its way is the installation for timber transport at the New Hornow mills, in the Usambara Mountains of German East Africa, and its success during the last eighteen months is likely to encourage the provision of similar devices in other colonial timber regions where transport difficulties exist. The distance covered by the installation mentioned is upwards of five miles, that is, from the sawmills on the edge of the forest, situated at an altitude of 5,220 feet, and the nearest railway station, between 70 and 80 feet above the sea level. A log road or other surface line was out of the question in such a descent, especially as the rock is of a treacherous character. How steep the cableway is in parts may be gathered from the fact that between the two angle stations the gradient is actually 41 degrees, which has been rarely exceeded anywhere in the world. Along this cable rough or sawn logs up to 46 feet in length, and weighing one ton, make their way down the mountain side to the railway station, and rails and other loads are hauled up to the sawmills.

The construction of the cableway was an engineering feat of no ordinary kind, and necessitated the erection not only of two angle stations mentioned but also of two tension towers, and it is to be noticed that some of the supporting towers are of considerable height, one actually being as high as 100 feet. Steel had to be used throughout owing to the danger of wood-destroying ants, but it is interesting in view of similar installations which may be put up that the whole work was carried out by unskilled native labor under the direction of the European engineers.

Whitewash for Sawmills

The Lumbermen's Underwriting Alliance of Kansas City, U.S.A., reiterates the recommendation that a thorough cleaning of all woodwork of sawmills and factories, and then the application of a generous coat of whitewash spells very much for decreased fire risk. The Alliance suggests the following approved recipe for the making of whitewash: Slack one-half bushel of lime with boiling water, keeping it covered during the process. Strain it, and add a peck of salt dissolved in warm water; 3 lbs. ground rice, put in boiling water and boiled to a thin paste; ½ lb. powdered Spanish whiting, and 1 lb. of clear glue dissolved in warm water. Mix these well together and let the mixture stand for several days. Keep the wash thus prepared in a kettle or portable furnace, and, when used, put it on as hot as possible, with a painter's whitewash brush.

Measure Your Lumber With the Barkey Lumber Register

The most accurate measure on the market.
Can be instantly adjusted.
Capacity 60,000 feet.
Measures any width and length.
Can be used on any moulding or matching machine.
Will work backward as well as forward, and will not slip on smooth or icy boards.

SENT ON 30 DAYS' TRIAL. RETURN AT OUR EXPENSE IF NOT SATISFACTORY.

Review of Current Trade Conditions

Ontario

The inability of the railroad companies to supply cars for the transportation of British Columbia shingles owing to the large amount of grain being moved in the west is causing several Ontario firms no little inconvenience. Several of the firms are behind in their orders and state that they cannot rely on deliveries. No advance in prices has been announced in British Columbia shingles during the last two weeks.

Trade in Ontario continues to be very good with prices about normal, although the scarcity of dry hemlock is causing some annoyance. Dry lath are also hard to get and firms that are fortunate enough to have a stock on hand are besieged with orders. The pine market is firm with a good demand and apparently large stocks on hand. The hemlock market is causing some concern among local dealers as to the probable cut and source of supply for the next year. This year's cut is said to have been from forty to fifty per cent. lower than any previous year, and owing to the large amount of building under way in the larger cities in the province the demand has been very heavy, coupled with the best of prospects for the next year. Bark dealers state that whereas in other years they have been able to get from 25,000 to 30,000 cords of bark per season this year they have been able to get only about 12,000 cords. It will thus readily be seen that this year's cut has been considerably below the average and as the building trade continues to be good with expectations that next year will eclipse all records. The mills are preparing to take out a cut this coming winter that will again put the market on a firm footing.

The hardwood trade continues to be good, with fair prospects of further demands. The prices are normal as a rule, with a small advance in basswood and rock elm. Basswood No. 2 and 3 common is selling at $17 and 6/4 and 8/4 common and better at $37, an advance of $2 per M. Rock elm, No. 2 common and better, 6/4 and 8/4, has advanced to $37, but birch, maple and oak remain about the same.

Taken as a whole the trade in Ontario is good and promises to continue so for some time.

Eastern Canada

Trade conditions in Eastern Canada continue very good. The demand is much larger than the supply, dry stock being particularly scarce, with building operations active. The prices are good with a slight tendency to advance all along the line, owing to the scarcity of material. At present there is no birch in sight and manufacturers who use that wood to a great extent are considerably worried as to the probable future source of supply. Dimension timber has a good sale, although it is a little scarce. The export trade has been hampered to a certain extent by the recent dock handlers' strike in British ports. Steamers are tied up and consequently very little loading has been done, but outside of that trade is reported to be in good condition. An advance of 10s. for standard on the freight rates to London has been announced. Sulphite pulp in the Maritime Provinces has advanced $2 since last reported and is stated to be in good demand. A proposed freight increase on Canadian pulp from United States points has caused some little discussion. The proposed advance will come into effect in September and will amount to about 35 cents a cord. The American interests are strongly objecting to this advance.

The spruce trade is very active at the present time, although stock is very scarce, particularly dry stuff. Mill conditions are unsatisfactory and most of the large manufacturers have very little stock on hand. Prices are good, dealers seeming to be more anxious about the price. New York and Boston sales are good and business is expected to remain in fair shape for some time. Frames at Boston are being held at $25 by most manufacturers, although several sales are reported below that figure, concessions of 50 cents being granted to a large extent in connection with the lower figures.

Hemlock throughout the east is in good demand. The building qualities of this lumber are coming to the front in the eastern states to a great extent and in consequence it is being called for continually. Dry stocks are very scarce and the mills have practically no supply on hand. Prices are if anything on the increase, eastern boards bringing as high as $23, although most of the sales are reported at $22.50 and a small number at $22.

Building operations throughout Nova Scotia and New Brunswick are being pushed as the season advances and the Maritime dealers report a good demand. Shingles—cedar extras—have gone up in Boston. Most sales are reported as from $3.85 to $3.90, although it is said that many manufacturers are holding out for $3.95. Clears are selling at $3.45 and $3.50, which is considered a reasonable figure. Lath—particularly good dry stock—is in demand and are commanding good prices, 1⅝ in. being worth from $4 to $4.10 and 1½ in. from $3.70 to $3.80.

The market reports in general in this part of Canada indicate a large increase in the amount of business done over the same season last year and prospects for the future are very bright.

United States

The present crisis in the primary elections in Chicago has had little or no effect on the lumber trade in the United States, and there is little concern as to the outcome. The demand continues to be good with the mills working overtime to catch up with their ever-increasing business and also to get stock for the winter months. Prices are excellent with increases in certain grades. Dealers in the east report a good season with a heavy demand for building material. Hemlock prices in Buffalo have advanced about 50 cents per M. with a fair demand and well assorted stock on hand. Pine, on the other hand, is very hard to get, box lumber being particularly scarce. Business in general in New York State is active with building operations increasing with the advance of summer. The Boston spruce market is not up to its usual standard although prices remain about the same. Many dealers are complaining about selling on the old basis of lengths, but outside of that the market is in fair shape. The hemlock trade continues to be good. The prevalence of building throughout the territory in which hemlock competes with Southern pine and other woods, is absorbing a large amount of hemlock, dimension and sheeting. Prices are well maintained and trade in general is in a much more prosperous condition than last year. At the present time there is a large consumption of coarse lumber in box manufacturing, Northern pine being particularly in demand. The box dealers are clamoring for stock and while the dry supply is practically used up, the green output is spoken for far in advance. This shows the strong hold the softer woods have on the box market. In the West the situation is good, with an ever-increasing demand and fair prices. Dry stocks are well reduced and are broken, and it will not be long before considerable of the present year's cut is mixed with old stock to fill orders. The mills are all running and a slightly larger cut than last year is expected. For fir the demand is heavy, silo material being particularly in demand. Cypress has gone up, an increase of $1.50 per M. being reported in sidings, and it is said that several firms have withdrawn quotations from the market altogether. The high waters in Louisiana and the Southern States are causing a shortage of cypress and yellow pine, but as the water is gradually receding it is expected that the mills will again be in operation and running full time in the course of the next couple of weeks. The Southern pine market shows a somewhat better demand. The mills are getting into good shape again but many of them are oversold and expect trouble for some time in placing orders. Shipments are being made somewhat more promptly now as the high water is receding but they are still hampered with a car shortage.

The hardwood business looks a great deal more promising than it did a few weeks ago. The Mississippi waters have fallen to a great extent and logging is being resumed in Arkansas and the Mississippi delta. Dry lumber is scarce but the demand is urgent and prices are well maintained. Plain oak, elm and cottonwood are principally in demand—in fact all dry hardwoods are scarce and the demand is large, Northern hardwoods, on the other hand, are in a very satisfactory condition as regards both demand and prices. All available stocks in Michigan are reported spoken for and dealers who have maple, birch, beech, soft or rock elm on hand are holding fast to prices and expecting further advances. Maple, basswood and beech are worth from $1 to $3 above the figures of a year ago. The output of birch is limited and it is picked up as fast as it is in shipping condition. Maple of 5/4 thickness is very much wanted in Buffalo at the present time and plain oak is also in demand.

Great Britain

Generally, the lumber trade of Great Britain has been depressed somewhat of late as a result of the dock strike which originated with the cessation of work by the lightermen, which stopped the delivery of timber from ships arriving in the docks. In face of the deadlock which prevails at the docks at the time of writing it is satisfactory to learn that the Port of London Authority are disposed to meet the members of the timber trade in their present difficulties by granting, in the case of cargoes intended for overside delivery, a modification of the usual charges made on landed goods.

As a relief to the naturally quiet conditions obtaining in London, the trade at Liverpool is fair, with good deliveries of timber going into consumption. A healthy demand continues for spruce, while pine is still a strong issue. Timidity is experienced in transactions for future delivery, this being attributable to the speculative condition of the freight market. It need hardly be said that freight rates are

Lumber You Can Sell With Satisfaction

TOWING A LARGE RAFT OF LOGS TO SAW MILL AT SARNIA

You want to tie up with a Company that can supply your lumber quickly and cut your bills to order the year round.

Besides there is great satisfaction in selling to your trade lumber that is carefully cut and always strictly up to grade.

Complete dry stocks of Norway and White Pine always on hand for prompt shipment.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"RUSH ORDERS RUSHED"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

A. F. Holden, Pres. J. M. Diver, Vice Pres. and Gen'l. Mgr. E. C. Barre, Ass't. Mgr.

still rising. Recent arrivals at Liverpool include shipments of pine, birch and spruce from Montreal; birch and doors by the "Empresses," from Quebec, and spruce from Pictou, N.S.

There is little feature to the trade of the Bristol channel ports and things are quiet, although there are healthy prospects for business as soon as the labor troubles are satisfactorily and permanently settled.

Business continues fairly brisk at Manchester, with the bulk of recent imports going into direct consumption. The last arrival list is the heaviest since the season commenced, over 4,000 standards of spruce having arrived, largely from Miramichi and Quebec. At the time of writing the "Manchester Shipper," now discharging, has not less than 2,000 loads, including waney pine, birch and elm logs, pine deals, boards and sidings, spruce deals, etc.

At Glasgow, trade continues on moderately steady lines although a fair movement has been in evidence, both from the stored stocks and also the fresh arrivals coming to hand. It may be mentioned that the total deliveries from the public yards, so far as the year has gone, show a very considerable increase as compared with the same period last year. No doubt this is not attributable to the improved demands alone, but is partly due to the fact that imports this year have been on a rather more restricted scale. The result is that stocks generally are now unusually light, which is an important factor in the maintenance of values. The demand for Canadian yellow pine goods remains rather quiet, the little request that exists being confined chiefly to the lower grades in broad specifications. First quality deals and sidings are little asked for, thanks to their advancing cost, which precludes their use for anything but the highest class work. For ordinary purposes, where cost is a primary consideration, recourse is had to cheaper substitutes. For instance, there is a choice of Siberian pine, sugar pine, Californian pine, Mexican pine, silver pine, Columbian pine kauri pine, Californian redwood, cypress, Gaboon mahogany, to mention but a few, most of which would probably never have secured a footing but for the vastly increased cost of Canadian pine. As it is, there is a growing consumption in these woods, and, of course, a corresponding shrinkage in the case of the Canadian staple.

Interesting Facts About Timber Cruisers

An ardent admirer of the craft exclaims:

"The timber cruiser is the autocrat of the woods. He is the king of woodmen. He lives well, feels well and does well financially. He never has to take a vacation to get away from the grind of the office. He never has brain fag. His liver is always in order, and his conscience is clear. At night he sleeps without disturbing dreams. But he has to work harder than most men think it possible to work."

Probably the average timber cruiser would smile a sardonic smile at this glowing outburst. Yet deprived of its poetry it carries some truth. There is no doubt about the cruiser's appetite and his ability to sleep. In the old days he lived as well as the weight of his pack would allow. In these later times, when railroads and wagon roads in the older timber states penetrate the remotest sections he is never far from some base of supplies. In some sections of the far West and in Canada he is still forced to plunge into the deep forest many miles from any settlement or any place where he can lodge at night or procure food.

When timber cruisers first began to range the pine forests in Michigan and Wisconsin they had to cut entirely loose from civilization and remain in the forest, many miles—sometimes a hundred or more—from settlement, living like the wild Indians for weeks and months. The first cruisers were men like Dr. David Ward, who inspired by the prospect of great gain through adventure and pioneering, as well as by faith in the possibilities in untraversed pine forests, penetrated beyond the ordinary range of timber lookers and lumbermen, discovering chances for the entry of land that by the rise of value might enrich them. Such men blazed the way for the practical lumbermen who cleared the rivers and creeks, erected dams and mills, and pursued the regular course of logging and manufacturing of lumber.

As the lumber industry developed, there was a call for pine stumpage, and timber lands began to be marketable property. Any proposition to sell or buy carried with it an estimate of the quantity of standing timber on the area involved in the deal, and thus there gradually evolved a class of estimators, or cruisers, as they came to be called, because they cruised through the forests in quest of timber chances.

Through experience the cruiser becomes expert in his vocation, and acquires almost a second-nature aptitude in surveying with a look a group or stretch of standing timber and quickly coming to a judgment as to how much timber by the thousand feet, board measure, there is to the acre. He can walk through the woods, as one observer says, and determine within 10 per cent., frequently within 5 per cent., the amount of lumber that can be made from the standing trees. Besides the saw timber that can be converted into a given amount of lumber, board measure, he can tell one how many pieces of piling, railroad ties, shingle bolts, telegraph poles, or any other kind of coarse forest products, even to cordwood, can be cut from a given acreage of land.

The cruiser, when he goes afield, works fast and hard, making long days and staying out in the woods until his task has been completed. A good cruiser can "look" or estimate a quarter section each day, and sometimes doubles that area for his day's work. He performs his arduous task for a compensation of $5 a day. He has an assistant or compass man, who is paid $3 a day.

The outfit of a cruising expedition consists of a compass and a pack or packs loaded with provisions, the amount of the latter being determined by the distance into the forest the cruiser intends to go from his base of supplies. Salt pork forms the substantial part of the cruiser's commissary. He adds flour, corn meal, tea, coffee and such other essentials and luxuries as suit his tastes. Tobacco and pipes solace those who smoke, and probably most cruisers indulge in the weed, and possible a little of the "ardent" is carried along for colds, bruises and snake bites, but not much, for a satisfactory amount as a beverage would too much add to the weight of the pack. The culinary outfit consists of a frying pan, a tin dish or two, and such simple things as pedestrian campers usually carry. Everything of that character is figured down to the least possible bulk and weight.

The compass man generally is an apprentice to the estimator, and his apprenticeship is a hard one; but his wage of $3 a day is considered good pay for a man who is just learning the business.

When the cruiser and his man arrive at the timber land that they intend to estimate, the first thing is to find a section corner, for that is absolutely necessary to determine the boundary of the land they are to work on. The finding of a section corner often is a difficult task. In the north woods it generally is a cedar post driven deeply in the ground so that its top scarcely shows above the surface. Often it is covered with leaves, decayed foliage and branches, and may be overgrown with brush or obscured by fallen trees or branches. It is the custom of surveyors to mark trees, called "guide trees," as near the corner as possible, from which search can be made for the post, or stone, which sometimes is used. Four trees are blazed, forming a quadrangle the centre of which is the post. The cruiser knows that he must search inward from these four trees in order to find the corner. The guide trees are blazed on the sizes, but the hewn spots frequently become so obscured by overgrowth that none but the most practiced eye can detect the blazed trees from a little distance.

The cruiser has a blue print map, with the section and quarter sections marked on it, together with some streams and a few roads, perhaps, which assist him in determining the general "lay of the land." Instinct and practice do the rest.

In going through the deep woods in search of land of be "looked" the aid of the compass is depended on. In later times, when the timbered sections have been traversed by railroads, cut through and through by highways and logging roads, and to a considerable extent are occupied by settlers, the compass is less essential than in the time when the forests were unbroken for many miles, and the only means of communication were the streams and an occasional tote road leading to some remote logging camp.

When the cruiser arrives at a point that he concludes is near the scene of his intended operations he selects a tall tree that stands in the direction in which he wishes to go and walks straight toward it, never taking his eye off the tree. He may have to struggle through windfalls, plunge through gullies and tear his strong garments in going through dense brush, but he never loses sight of his beacon tree. He determines the distance to the point where he wishes to begin operations by counting his steps, figuring by tallies—sixteen tallies making a mile, generally counting 132 to 140 steps to a tally—and so expert do these roadsmen become that they can "tie up" at the end of a mile of walk through the woods, up hill and down, and over the most difficult ground, within a few paces of the place the map shows them that the section corner mark should be.

In estimating the timber on a tract the cruiser goes over each forty acres twice. The compass man walks ahead, the cruiser following and estimating the timber. At each tally the compass man steps off twenty-five paces and measures half a dozen trees. Sometimes a circle with a radius of twenty-five paces is figured as an acre, and the cruiser by taking the average circumference of the trees in this acre and counting the trees can reach a conclusion as to the amount of timber on this single unit.

The foregoing describes one method of estimating. Another is by going over the land in strips, of four or five rods in width. The cruiser takes one side of the zone and the compass man the other. Beginning at one side of the "forty" the two men walk these parallels, the compass man counting the trees and judging of their average size, the two men conferring together as to that, while the

Douglas Fir for Finish

is rapidly gaining favor in Eastern Canada. For years this beautiful wood has been used extensively in good work in the west but is now recognized in the east as a first class Material and is specified for the best work by Architects and Builders who think.

cruiser records the result on blanks he carries for that purpose. When the "forty" has been gone over in this way the result is easily ascertained. In this work the men become so expert that by a glance at a tree they quickly, and seemingly by instinct, reach a judgment as to the amount of timber in the trees, can tell how many saw logs there are in a given tree, of what diameter, and the quality of them. They also can name the different kinds of wood, and in case the timber is mixed, what the percentage of each kind is, and what kind of merchantable stuff each variety can be worked into. Old cruisers have said that they can go on to a forty, or an eight, or even a quarter section, and by going over the piece carefully, without any special attempt at record, can very nearly arrive at a conclusion as to how much merchantable timber there is on the tract. Not only can trained cruisers do this, but any lumberman, who perhaps has cut the logs from many square miles of land, and has, in quest of timber, hunted the woods for years, can with a near approach to accuracy reach an estimate of the amount of timber on a tract by merely walking over it and carefully estimating the stand by eye-measurement, so to say, sizing up the trees. Really the cruiser is the man who brings the estimate that the owner, the would-be purchaser, or the log jobber previously made to a recorded exactitude. This is desirable as a basis for sale and purchase. It also relieves the seller and buyer of much time and hard work.

When the day's work of the cruiser and his compass man is finished the latter prepares the evening meal while the cruiser proceeds to make elaborate compilations of the day's estimates. He figures the amount of timber on each forty acres, and by means of a rough sketch shows where the timber is good, where it is sparse, where it is burned over and other features that may be valuable to his principals.

These sketches he embellishes with topographical outlines, for the configuration of the surface is important. Features in respect to taking out the logs must be reported. Rough land, with poor chances for making logging roads, is an objection to an otherwise good timber tract. In such cases a valley, marsh, lake or other level by which hauling can be made easy is a desirable feature as furnishing a way to haul logs without surmounting hills.

We will assume that at the end of a month, during which time the cruiser and his compass man have travelled possibly hundreds of miles, mostly on foot, they go back to town and report what they have found. The cruiser is paid $150 for his services and the compass man $90. This is considered good pay for men who have had their expenses provided for and have had no opportunity to spend their wages from week to week. But the city man who earns as much at light office work or mechanical employment would scarcely change places with the cruiser and his compass man, for he would dislike the fatigue, the solitude, the hazard, the discomfort that comes of prolonged out-door life in the woods. Yet the city man could do worse than to be a cruiser. Against the hazard of the forest he runs the risk of multifarious accidents in the city, constantly jeopardizes his health, breathing foul air, has to coax his appetite with strong drink, becomes dyspeptic, nervous, disgusted with the monotonous grind and the selfishness of strife for gain or a mere livelihood, and is the victim of all sorts of annoyances. The woodsman breathes pure air, is invigorated by outdoor exercise, has a good appetite for the coarsest food, sleeps the sleep of the weary and never knows that brain and heart fag that comes of too much contact with men and competitive strife.

The functions of the cruiser is very important to his principal, for on his reports hang sales that involve thousands and hundreds of thousands of dollars. He must be as honest as a man can be and also must have the secretive faculty, as it is an unwritten law that the cruiser must keep his information for his employer only. If the cruiser is known to be dishonest or inclined to blab to outsiders his name is "mud" among timber owners and dealers.

At all leading points in the lumber regions, where there are groups of mills, an assemblage of timber dealers and log operators always are to be found a number of professional cruisers. They even have offices or headquarters with some lumber concern, and are ready to take to the woods whenever a favorable opportunity offers. Cruisers sometimes become timber dealers, and pick up advantageous chances for themselves, but the majority stick to their regular vocation, content with their wage, while their work is the basis for the amassing of fortunes by those who employ them.

The old Machinery Hall in Lansdowne Park, which was built for the first Central Canada Fair at Ottawa, twenty-five years ago, has been removed. The hall contained some valuable timber which will be used for construction in other parts of the grounds. Some of this timber which has already been in use for a quarter of a century is reported to be as good as ever, and worth $75 a thousand.

What a Lumberman Has to Contend With

By a Lumber Doctor, in the St. Louis Lumberman

When we get to where we can sign our names to checks and the checks get paid when presented at the bank, we often forget what the yard man has to contend with. I mean by the yard man, the man who is employed in a yard in a town or city of, say 3,000 inhabitants or over. If we would only go out in a yard and tie ourselves to him for a day at a time once every six months, we might learn a great deal. He must be a great big-hearted, broad-shouldered sort of a fellow who never gets mad and can stand all kinds of unpleasantness. He gets blamed for everything that goes wrong, and his case puts me in mind of the instructions the boss plumber gave me the day I started to learn the plumbing trade. He said: "Now, d—n you, I want you to distinctly understand that no matter what goes wrong, you are to blame and are to keep your mouth shut about it, too; and no matter what you do that deserves credit, I get the credit, and I am to keep my mouth shut then." If some of us come out into the yard and load up all the suff off a pile and then don't put it on the want book when we run out, the yard man gets the blame for not keeping up the stock. We give the yard man instructions not to cut up boards and let scraps accumulate, but when a customer comes in and says he wants a board 12 inches wide and 4 feet long, we say "just go out into the yard, the yard man will fix you up"—and then we raise Cain with him again when we find the scraps. Now then here comes a good customer into the office and pitches down a bundle or a sack full of empty sacks and says, "I want to pay my bill." Here is twenty empty sacks I want credit for. You give him credit and afterwards pitch the sacks out on a pile in the yard. When you invoice you run across a lot of stray sacks and raise the devil about it with the yard man. If the driver is told to load on some joists while the yard man is gone to dinner or is busy somewhere else, and turns the pile all upside-down, the yard man gets the blame. Then you loan the saw or hatchet to a neighbor and he doesn't bring it back; the yard man is expected to stand the blame for not having it in place when you reach out for it. If we forget to put the address for delivery for some contractor's stuff on his ticket, and there is more than one job, and he sends it to the wrong job—again the poor yard man gets the deuce. Then if some one brings back stuff and tells you about it and gets no credit for it, and the yard man sees him talking to you and thinks you credited it when he returned it, then when the customer makes his kick the yard man gets the blame for not making the credit ticket.

Taking everything into consideration, his lot is a pretty hard one.

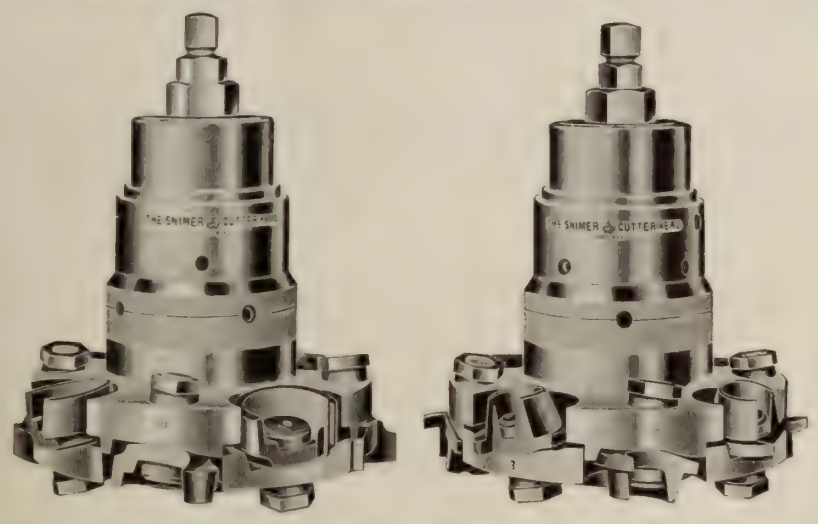
But, on the other hand, the office force gets theirs, too, when they have to adjust the mistakes that are made by errors and carelessness of the yard force. There are miscounts, bad grades, wrong lengths and various other things that they have to account for. So the best thing to do is to keep posted and learn the business, and know that you are right.

A Cure for the Wholesaler

There is not a retail lumberman who does not quite often take occasion to write for prices on several cars of yellow pine, and quite often as many as ten cars at a time. Now where does he get his list to write to? Get on that list of every retailer, Mr. Wholesaler, and you are all right. Now it costs lots of money to get on that list. Some firms get on my list by sending us an especially good car of stuff, and we remember it. Others get on by persistent advertising in the lumber journals; others get on by novelty advertising, such as paper clips, paper weights, daters, letter-openers or something of that sort; some by the persistent sending of price lists. One firm has got orders for eight cars of lumber by sending us a yard tool box containing a saw, a hatchet and a rule at a time when we did not know them. They sent it to us unsolicited, and I sent them an order for a car of lumber unsolicited, and as it was good we have sent them seven more. On the other hand, I have in mind a firm who have sent us shingle quotations every week for several years, but think their shingles are not good because they send out their quotations on the very cheapest paper, in the very commonest envelope obtainable, and under a one cent stamp—and while this is unjust, it is a fact. Many firms I patronize or don't patronize on account of the men who travel for them. I believe if the wholesaler will get a nice little reminder on the retailer's desk it will be a fine "ad;" not one to put in his pocket or take home, but to put right up in front of him. It will be the very best kind of an investment.

Don't buy the very first thing that you see, but buy something that will make us think of you, and you will get the business. I just thought of a scheme; get a photo picture of a nice young lady and have it put in a circular frame fixed to hang on the desk, and put on it "I'll get the letter if you send your order to ——— Lumber

THE SHIMER CUTTER HEADS



The "Shimer Limited" Cutter Heads with Expansion, Fig 627 and 628
Price, for Flooring, $72.46 per set complete.

Planing Mill Costs

Scientific efficiency in the planing mill should not exclude the Cutter Heads on your machine. What they are and what they will do determines to a great extend the cost of your product. This being the case it is incumbent upon the buyer to place in the hands of his men the most efficient Cutter Heads made.

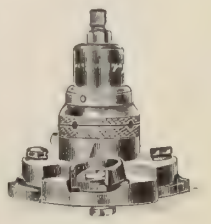
The Shimer Limited Cutter Heads are particularly suitable for the flooring manufacturer who owns machines with a feeding capacity of 150 lineal feet or more per minute. They are made to stand the hard knocks incident to matching all kinds of lumber at fast feeds and are provided with all the time and labor-saving features for which the Shimer Cutter Heads are known. In addition they have a very practical and safe self-centering device which also clamps the Heads to the spindle in so secure a manner that no set screws are needed.

These Heads are fitted with reliable, long life Circular Bits that have a specially acute cutting angle for clean work at fast feeds, and are fastened to the Head with holding bolts made specially strong in material and design for this particular purpose. These Circular Bits contain from three to five inches of cutting edge and have in their contour the exact counterpart of the shape of the mould, guaranteeing uniform patterns as long as there is a piece of the Bit on the Head, when they can be duplicated at small cost and the pattern perpetuated indefinitely. This means a great saving in material as over-runs of flooring can be duplicated whenever desired or stock made with the surety that the tongue and groove will always fit.

Write us freely about your Cutter Head conditions, giving measurements of your fastest machine, and if it will swing the Heads and feed over 150 feet per minute, they will be made to fit it and sent on trial for 30 days.

Do it now!

Our Popular Cutter Heads

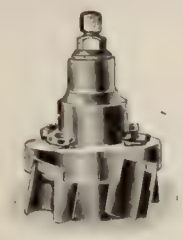


Figs. 202 and 203 are the leading tools, having Conical Duplex Bit Seats and The Shimer Cutter Head Expansion. Flooring Bits will work from 13/16 to 1½-in. in thickness with tongue and groove proportions expanded to suit.

Price, net, complete with one set of flooring Bits, the gauges for setting the Bits and wrench $40.95
Extra Bits for Flooring 11.44
Extra Bits for Ceiling 10.40

With 4 Bits to Each Head

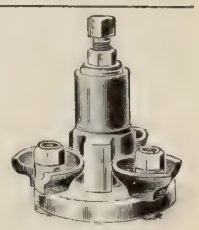
Jointer Heads



Figs. 54 and 55, with four Bits in line of work, shear the cut downwardly to insure a sharp and clean upper edge. They cut clean and free and are shipped out under our guarantee to give satisfaction.

Price, Heads, complete with Bits for 15/16 to 1¼-in., net only $31.20
Extra Bits 1½-in. face, the set 10.40
Extra Bits, 2-in. face, the set 12.48

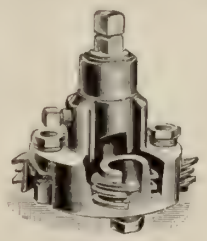
O. G. Batten Heads



Figs. 48 and 49, represent our best tools for this work, having 3 Bits in line of cut so arranged upon their seat inclines as to protect all but cutting edge against friction and wear.

Price, two Heads, complete with Bits, net only $31.98
Extra Bits, each, net 2.08

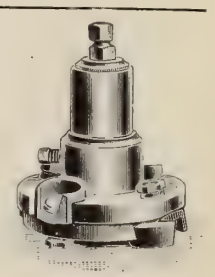
Double Ceiling Heads



Figs. 45 and 46, are made in solid section, steel forged, with Bits of special design to cut two tongues on one edge of board, and two grooves on opposite edge, to be re-sawed for two thin boards tongued and grooved. Very complete.

Price, with one set of Bits, net $40.94
Extra Bits, per set of (8) 16.64

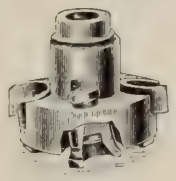
Ship Lap Heads



Figs. 38 and 39 are made of steel forgings, in solid section, designed especially for heavy duty. The bit seats have the latest improved slants to provide free cutting edges, and we sell them at the following low and net prices:

Heads with one set of Bits to work 15/16 to 1½-in. thick, net $34.84
Extra set of Bits 11.96

Door, Sash and Coping Tools



That save all the hand fitting. No changing of patterns, therefore, no trouble in framing door and sash parts when matched with the Shimer Cutter Heads.

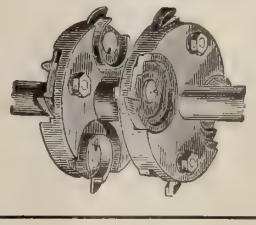
DOOR AND SASH HEADS

Fig. 82, solid flange, Door Head $10.75
Fig. 84, Expansion Door Head 13.35
Fig. 86, solid flange, Sash Head 9.75
Fig. 206, Expansion Sash Head 12.35
Bits to work 1-in. to 1¼-in. Doors, 4.. 7.28
Bits extra to work 1 to 1¼-in. Sash (2 Moulded Bits, $4.30; 2 Rabbeting Bits, $2.86) 7.16

COPE HEADS

Fig. 83, Cope Heads (2) $12.90
Coping Bits, each 1.43

The Shimer Box Board Matching Heads



make a uniform cut and close fit, as well after years of use as when new, with no friction upon the Bits. For thicker material the Bits can be expanded.

Price for two Cutter Heads to match ⅜ to ½ inch, $23.60.

We also furnish when desired a Yoke Mandrel with self-oiling boxes, boxed f.o.b. Galt, $11.05.

A Lumberman's Dream

Some lumbermen claim that they can't find anything about their yards to advertise, but the other day I got a letter from a retail dealer, a friend of mine, who wrote:

Dear "Doctor:" You know I wrote you some time ago asking you, as secretary of the Lumber Dealers' Association, to try to get my neighbors to quit selling lumber into my town; and I got awful mad when you wrote me "God helps those who help themselves"—"convince your customers that your place is a better place than your neighbor's to buy their material—Advertise." Yes it made me mad to think we should be such darned fools as to elect and pay a man $3.30 a month to tell us something that we already knew about. As for quoting the Scripture to me—I know more about the Bible than you ever will be able to learn—you darned old sinner you, but as to the other two. The first is easy enough to tell a fellow, but isn't so easy to do, but I guess if a fellow knows how to do the last item mentioned it will do the middle one for you. I was so mad at you when I got that letter that I be blamed if I could sleep at all that night, and I tried counting 500, and then tried holding my eyes open as long as I could, and the longer I counted and held my eyes open the madder I got till I know if I had been able to get at you there would have been one scared Dutchman. Well, I either went to sleep, or somewhere else, and began to see that word "advertise" loom up before me; and then I began to wonder what to advertise if I would be fool enough to spend my money that way. Well, as I said, I don't know whether I was dreaming or what, but I seemed to start out of the back door of my office into the lumber yard when a fine big bunch of 5 to 2 Clear Cedar shingles stepped up to me, made a bow and said, "I am a representative of a car of my class, just arrived from the Pacific Coast. I am of the upright clear family, all well made and from a family who have stood the weather for forty years on a stretch. Tell your customers to nail me on with a galvanized or cut iron nail and I am good for fifty years. I am—

"Hold on there Cedar," said a bundle of Spruce Siding, butting in, "do you want to take up all the boss' time allotted to the West? When it comes to being the nearest descendent to the good old White Pine, for which we all have respect, there is none of them who comes as close as my people do. I take and hold paint better than any of the others do, and hold my position well. 'Tis true I am easily worked, but that is a virtue in building material, and not a vice, and you can tell your customers that they can depend on us to do our part towards upholding your reputation, besides—

"Shut up old eight-day clock, said a fine 26-inch Clear Red Wood Board, 20 feet long. There are others who have virtues besides Spruce. We beat the world when it comes to size and beauty. There is scarcely a limit to our dimensions. We can puzzle the largest saws in the world. A couple can waltz all night on one side of our boards and never step off, and there will be plenty of room for the orchestra on us, besides. Then when it comes—

"Step back Redwood, as the West coast has only five minutes left of its allotted time and that belongs to us," said a fine specimen of Douglas Fir. "We want the boss to tell the inhabitants around here about us. While we take paint and stand the weather, we claim to be the toughest lot that will do that—and when it comes to porch flooring or stepping, we are far ahead of all the rest."

At this point the switch engine shoved in the Southern Delegation and the voice of the Douglas Fir was lost amid the puffing of the engine and the clang of the bell. The first to step from the "Special train from the South" was Louisiana Cypress. Bowing low to me, Louisiana said: "So few people around here know me that I want you to expound my many virtues to your customers. It would take an entire train to carry my different garbs. I have many shades and take any varnish. Outside I am at home, and thrive inside as well. On top or below is all the same to me. You can't find another timber that can be made into as many things and adjust themselves to the occasion like I can, and if I am a door, a piece of siding or a piece of finish, it is all the same."

"Run off on the switch then," said the big burly Yellow Pine Timber, who had just stepped from the sleeper. When it comes to "general use," he chooses us to make up the greater part of his army, for we are the multitude. If they would draw on all the rest for a supply like they do on us, you would hear 'em holler. Tell your friends to house in their chickens with us, and also their horses and cattle. Tell them that we will save them 30 per cent. on their farm machinery if they will buy us to house it in, and tell them about the drop siding and lap siding that is made of us, and also the beautiful millwork, and then the fine vertical flooring and the mouldings; and when it comes to "finish," we are the "brightest star."

That isn't all, neither. I don't know how long it might have gone on, for at this point a piece of Native Oak got jealous at me for listening to the song of the sirens and rolled off the platform and hit me on the top of the head and brought me to my senses; and I woke up and found that I had knocked my head against the bed post. I have enough to advertise now for a year, and 'Doc.' I want to thank you; and my dues to the association will be forthcoming whenever you say the word, and if I don't bring 'em back it isn't going to be my fault, and I remain,

Sincerely yours,

"CHARLEY."

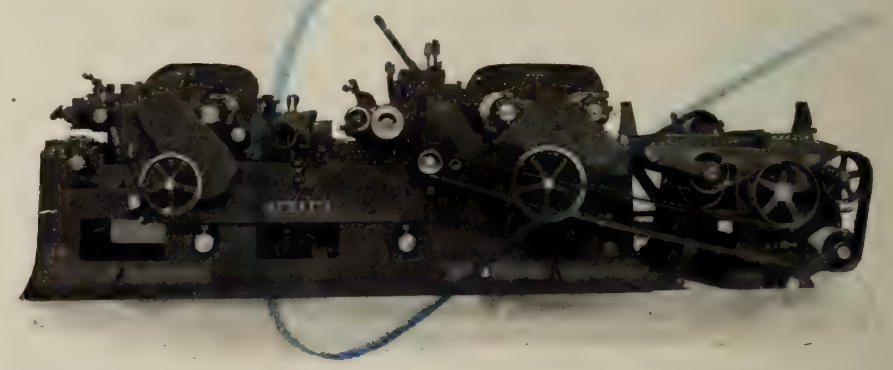
A New Fast Feed Matcher

The Berlin Machine Works, Limited, of Hamilton, Ontario, builders of high grade wood-working machinery, recently made the announcement that their engineers had built a new high-efficiency planer and matcher. This new machine is claimed to be the most powerful planer and matcher on the market to-day. It is built compact and low, every part being easily accessible from any side. It is constructed so as to permit the use of a special feeding mechanism for manufacturing a high grade of lumber at 250 lineal feet and more a minute. But where there is no necessity for manufacturing at this high speed, every convenience has been provided for the operator to handle his machine with the least possible effort. He has the feed of the machine in instant control from his natural position, being able to start, stop, or reverse almost instantly. Any parts that might be dangerous are encased for the protection of the operator.

These machines have already been installed in mills in every wood-working section and reports are that a number of manufacturers have been able to reduce their costs as much as forty per cent. and sixty per cent. by the installation. At the same time, a saving in grade all the way from ten per cent. to thirty per cent. is effected. From the standpoint of power consumed, they are a great improvement over the old style planer and matcher. While it is true that they use more power than the old style, one will do the work of two and three of the old style, and consequently there is a saving not only in the amount of power consumed, but in cost of labor that naturally is added to profits.

Another thing that assists in the reduction of upkeep cost is the elimination of gears—there being but five used on the entire machine. A heavy roller bearing automobile chain that is claimed to be capable of transmitting eight times the power required of it, drives the feeding mechanism, taking the place of the train of gears formerly used.

With the belting arrangement used on the new Berlin matchers, it requires less power to drive than any high-speed planer and matcher built. Independent gravity tighteners on the slack side of all belts give the maximum pull for every pound of power applied.



New Fast Feed Matcher made by the Berlin Machine Works, Hamilton, Ont.

Automatic takeup boxes on cutter head journals and side head spindles adjust with the wear without any attention whatever from the operator.

A number of automatic features lessen the labor of the operator. One of these is the gravity belt tighteners mentioned, which, aside from making the adjustments much better than can be done with the old style screw takeup, double the life of the belts. With gravity tighteners, belts go back to their normal condition after a heavy strain instead of remaining tight. The automatic take-up boxes adjust to the smallest fraction of an inch, yet do not cause the journals to heat or get loose. Sight feed oilers are another help to the busy operator.

The cutter heads are the 6-bitted thin knife round type, and produce an excellent finish to the stock. The knives need not be removed for grinding or sharpening, as provision has been made for doing this with them remaining in the heads. A more accurate cutting circle can be secured in this way.

The profiling devices at the out-feeding end of the machine, used for making mouldings, drop siding, celing, partition and various form patterns is very simple and probably the most convenient arrangement for making any shape of profile work. Milled bits which always insure a standard shape to the pattern used.

Both the horizontal and vertical adjustments for the side heads are made from the front side of the machine. The side heads used produce just as high grade work as the cutter heads.

"AMPHIBIA"

(WATERPROOF)

Leather Belting

and the frog are both alike

in as much as both are waterproof,—hence our registered brand. And we want you to remember this when ordering belting for any drive where moisture is present.

As to cost

"AMPHIBIA" costs less per day of service

than any other belt — therefore "AMPHIBIA" is the least expensive although it may cost you a little more at first.

This Higher first cost is due to the fact that we put more in the belt, more brains, more care, better material and better workmanship.

All this makes a big difference to you.

Lumber Waste in Box Factories

The lumber used in the manufacture of boxes is a pretty expensive item, from the standpoint of cost. Though the material market just now is favorable to the box man, in that prices are lower than they have been heretofore, it is safe to assume that the cost of manufacture is not going to be reduced measurably in the immediate future, but that, on the other hand, the chances in favor of the cost of lumber being increased gradually and steadily are excellent.

Any effort to reduce waste in the manufacture of boxes is therefore one which is worth attention. Under the best conditions, from 15 to 20 per cent. of the lumber bought is wasted, and if the lumberman is using a million or two feet a month, this item mounts up in a startling fashion. A million feet at $20 is $2,000; and if one-fifth of that goes into the waste pile, the loss is $400. If the cost of the lumber or the consumption is greater, up goes the loss through waste.

A scientific management specialist might be used to good advantage in the box business, if he could be persuaded to go through a shop and suggest methods of reducing the waste. It might cost a few thousand dollars to get expert advice from this direction, but maybe it would be worth it.

If the specialist's doctrines, properly applied, will assist the government in finding out why it takes so much more money for its shops to build a battleship than for a contractor, who is making a fat profit on the deal, there is no reason why the same general ideas would not be of aid to the box manufacturer in solving his particular problems. Without attempting to go into the technical part of the efficiency thesis, and assuming that the principles of horse sence worked out with special reference to reducing waste, will be efficacious, it is likely that the very focusing of the attention of box men on this feature of the business would result in some ideas being developed which would be of value to the trade.

One feature which commends itself is that in getting business an effort should be made to secure contracts for supplying as wide a variety of packages as possible. The advantage of this is obvious when it is realized that the more cutting lengths the sawyer has before him, the more good pieces he is likely to be able to get out of a certain board. The factory which makes only large packing cases is more likely to have a large loss in material than that which has a wider variety, including smaller boxes as well as large ones.

One large box company makes a point of giving each of its sawyers exact lists of the cutting dimensions of the boxes which are being made, no matter what stock the individual sawyer may be cutting. The various cutting lengths are in evidence so that if the sawyer finds that his board will not work up into an exact number of pieces of the size that he is cutting, he is able to cut the short end into smaller pieces, the length of which is determined by the cutting sheet before him.

A block, cut to proper size, is used in expediting this work, being fitted in so as to provide the proper length of the short piece. Its length, breadth and thickness vary, and by using the different dimensions, pieces conforming to those listed may be cut without the necessity of changing the adjustment of the saw.

The sawyers are impressed with the fact that it is desirable and necessary to waste as little lumber as possible, and their co-operation in working out the plan is insisted upon. Usually this is secured without much difficulty, although of course there is usually a tendency to cut the lumber "the easiest way," without regard to the economy of the operation. But by having a wide variety of cutting lengths before the sawyer, he is given an opportunity to reduce the waste as much as possible, and in this way much of the loss at the saws is gotten rid of.

An effort is made to dispose of the narrow pieces as well as the short ones. These can be worked up into strips and other material, though frequently it is discovered that the labor involved in handling the scrap is so great as not to justify carrying forward the plan of economizing. That is a feature to be taken into consideration. The labor involved in handling is considerable, and therefore when the cost of rehandlng becomes considerable it is the part of wisdom to scrap the lumber without trying to get more value out of it.

The ultilization of a large part of material which would otherwise be a total loss has been secured in many box factories through the use of a veneered stock. Thin lumber can be purchased at a low price, as defective pieces can be used which would be unfit for any more elaborate work, and the average veneer manufacturer would be more than willing to dispose of his reject at a price which would make it worth while to the box man. It would enable the veneer mill to move a lot of stock which in most cases is burned in the boiler room.

The making of veneered stock for use in boxes is not a simple proposition altogether, and more than one factory which has undertaken to dispose of part of its waste in this way has given up the job because the experiment did not prove satisfactory. Trouble with glue is one of the prolific causes. Usually glue is heated to too high temperature when it is being prepared for use in veneered work. One hundred and forty degrees is plenty of heat to give it, as it is not necessary literally to "cook" the material in preparing it. The heat is simply for the purpose of enabling the glue to flow easily and to be pressed into the pores of the wood.

Care in preparing the glue and spreading it will enable the box man to get excellent material with which to turn out his packages. The narrow pieces of lumber which are used in this work should not be placed too close together. Plenty of glue should be used, and for this character of work it is not always necessary that a high-grade material be used. The cheaper grades, provided they have plenty of body, can be used to good advantage.

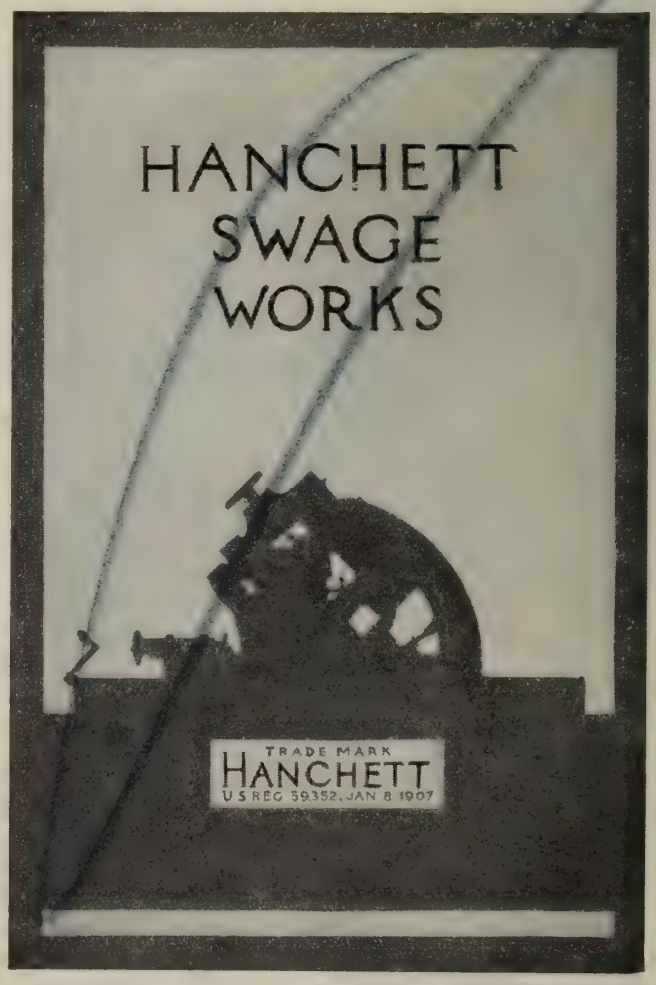
The result of the manufacture of this veneered stock is that the box man has utilized a lot of offal that could not have been gotten rid of in any other way, and has panels which are extremely effective. They can go into as good boxes as he is likely to turn out, and, in fact, many high grade cases are now manufactured with veneered stuff.

Speaking of the elimination of waste in the box factory reminds one that waste of labor is just as expensive as that of lumber. Where machines are taking stock from those immediately behind them, it is well to give them supplies of material which can be worked up in case the supplying machine stops for a few minutes. In some factories stock is piled up behind every machine, so that if for any reason the regular movement of lumber from one saw to another is interfered with, there will be nothing to prevent the succeeding ones from going ahead.

There is a good deal in studying the requirements of consumers. Boxes which now have certain specifications, which may not fit well into the plans of the factory, and involve considerable waste, can frequently be changed to the advantage of the user so that they will take stock which will work better into the general scheme. And by going over the stock carried in the yard and studying its possibilities one may occasionally develop plans for more effective use of material than are in vogue at the time.—Barrel & Box.

An Attractive Catalogue

The Hanchett Swage Works, Big Rapids, Michigan, manufacturers of machinery and tools for the care of saws and knives, have just issued a well-illustrated catalogue describing their filing room tools and machinery. The catalogue shows the various kinds of up-



to-date machinery and tools in this line, such as saw swages, shapers, sharpeners, stretchers, re-toothers, lap grinders, filing clamps, punches and shears, grinders, hammers, gauges, etc. It represents the last word in filing room tools and machinery and the company will be pleased to furnish this catalogue to anyone interested.

EDGINGS

Ontario

The planing mill of the Jones Hardware Company. Limited, at Lindsay, was recently destroyed by fire.

Taylor, Scott & Co., of Toronto, have purchased the wood-working establishment of Major Wooldridge at Palmerston, Ont.

The Naylor-Osborne Company Limited, has been incorporated with a capital of $60,000 to carry on a general lumber business. The head office will be at Essex, Ont.

The saw-mill of Graves-Bigwood & Co. Ltd., at Byng Inlet, Ont., was destroyed by fire recently, at an estimated loss of $20,000. The company will rebuild immediately.

The Spanish River Pulp & Paper Company have declared a half-yearly dividend of 3½ per cent. on the preferred stock. In future the preferred dividend will be on a quarterly basis.

Mr. Walter Knight, member of the big lumber firm of Knight Bros. Ltd.. of Burk's Falls, Ont., died from injuries sustained when his horse became frightened and threw him into a ditch.

The Smart Turner Machine Company, Limited, Hamilton, have recently received an order from Geo. Frid & Sons, for a duplex pump and also one from the Corporation of Dophin, Ont., for an Underwriters' Fire Pump.

The Minnesota & Ontario Power Company are beginning the construction of a $100,000 paper mill plant at Fort Frances. It will have a capacity of from 100 to 140 tons a day. They expect to have the mill in operation within a year.

The Montrose Paper Mills Company of Thorold, which recently amalgamated with the St. Lawrence Paper Mills Company have let the contract for the construction of new buildings which will cost over a million dollars, to Mr. J. M. Tremble of Niagara Falls.

The Ontario Government has been advertising the Abitibi Limits for sale on condition that a pulp and paper mill is erected. If this project is undertaken it should go far to develop that part of the country. The industry would draw population, and the Government would not have to worry over settlers or settlement of the lands so long as it continued its railway building north to James Bay.

At the last annual meeting of the Wood Products Company of Canada, Limited, held recently in Toronto, Montreal interests took over control, with the result that the management will be removed to that city. The following board was elected: Messrs. J. W. McConnell, president; Thos. Hodgson, vice-president; Nathaniel Currie, Col. Burland, Arthur Lyman, Dr. Milton Hersey, and F. J. Knox, Board of Directors.

The T. Beck Manufacturing Company, of Penetanguishene, have begun clearing away the debris caused by the recent fire. and will be starting in at once to rebuild their plant on the most modern lines. They were fortunate enough to just lose one sawmill, and are preparing to run the remaining one double shifts and thus make up for the loss, and in this way expect to cut as much as first intended. As no lumber was touched by the fire they are able to fill all their orders and business with them is practically uninterrupted.

Under agreement with the provincial government, Mr. Willis K. Jackson, a wealthy lumber merchant of Buffalo, and his associates, are to pay $98,364 for as many acres of land in the townships of Haggart and Kendry in Northern Ontario. They will clear the land, establish saw-mills and bring settlers into the district. The purchasers must commence within ninety days from the date of the agreement, and complete with all reasonable dispatch, a large permanent saw-mill, planing mill, sash and door mill, and all the necessary houses in connection therewith. The plants and buildings must cost not less than $70,000. To guard against the purchasers cutting down timber in advance of the work of clearing, permits must be secured from the Government before any cutting can be done.

Eastern Canada

John Hunter is offering his mill at Ormstown, Que., for sale.

The saw mill of T. Lemay at Megantic, Que., was burned recently.

The sawmill stock of C. W. Carbonneau, of Sorel, Que., is reported sold.

Mr. D. H. Pennington. of Inverness, P.Q., has sold his extensive lumber interests.

Rivard & Lynch have registered to carry on a lumber trading business in New Brunswick.

The T. O. Viall Lumber Company Limited have been organized. Their headquarters will be at Port Daniel, Que.

The woodworking factory at Fairville, N.B., formerly operated by Atkins Bros.. has been purchased by W. E. Lawton.

Dartnell Limited, has been incorporated with a capital of $40,000. They will deal in all kinds of builders' supplies. The head office will be in Montreal.

The sash and door factory of J. H. Lebeuf at St. Pierre, Que., was completely destroyed by fire. It will be rebuilt shortly, and new machinery will be required.

The Phoenix Mills owned by John A. Morrison at Fredericton, N.B., started operations on June 17th. They have a sufficient supply of logs on hand to keep them in operation until late in the fall.

Mr. M. J. O'Brien of Renfrew, has acquired a large tract of timber limits near Quinze Lake and Lake Expanse. Que. It is understood that he will build a 400-ton per day pulp mill on the property.

The Carritte-Patterson Co., Halifax, N.S., intend erecting a saw-mill 200 x 150 ft.. two warehouses 285 x 24 ft., and 60 x 40 ft., respectively, and a boiler house 50 x 35 ft. They will install a 400 h.p. boiler and engine.

A report from Lake Megantic, P.Q., states that the sawmill belonging to Mr. Telesphore Lemay has been burned to the ground and the entire con-

tents destroyed. The damage amounts to $12,000, with insurance of only $1,500.

Sir Rodolphe Forget is credited with a scheme to merge the Wayagamac Pulp & Paper Company, the Eastern Canada Pulp & Paper Company, the Spanish River and Ontario Pulp Companies and possibly one or two of the older established mills.

H. Boulay, M.P., Sayabec, P.Q., is arranging to erect a small spruce and shingle mill about eight miles from Sayabec, where he already operates a small mill. The new mill will contain one shingle machine and will cut about 200,000 feet of spruce annually.

Mr. William Rutherford, of William Rutherford Sons Company, Limited; Mr. Geo. Esplin, of G. & J. Esplin; and Mr. W. J. Sadler, of Sadler & Haworth, have been elected members of the executive committee of the Montreal branch of the Canadian Manufacturers' Association.

The management of the Wood Products Company of Canada has been removed from Toronto to Montreal. The following board have been elected: Messrs. J. W. McConnell, president; Thomas Hodgson, vice-president; Nathaniel Curry, Colonel Burland, Arthur Lyman, Dr. Milton Hersey, and F. J. Knox.

Between sixty and seventy million feet of logs were jammed last month within a distance of three-quarters of a mile on the Miramichi River in New Brunswick. In some places the logs were piled twenty feet above the level of the water. The approximate value of the timber in the jam was $60,000. Dynamite and heavy rains broke the jam eventually.

In an official statement of the East Canada Pulp & Paper Company, of Nairns Falls, P.Q., it is said that the plant, which has just commenced working, has been turning out between 105 and 110 tons of pulp daily. The output has been sold for a year ahead. The statement is also made that they have just refused a United States contract for the immediate delivery of 20,000 tons of pulp.

The directors of the St. John River Log Driving Company will place a boom at Six Mile Island above Grand Falls. The object of this is to catch the logs for the down river mills, which are late in coming out of the VanBuren booms and which heretofore have been scattered along the river during the summer. It is stated there are now over one hundred million feet of lumber in the boom.

The officials of the Eastern Canada Pulp & Paper Company have issued their first statement on the initial operations of the new plant which was set in motion at Murray Bay on June 1st last. It shows that the mills have exceeded earlier expectations in the matter of output. The first day's results were 42 tons output of pulp, while on June 18th the plant turned out between 105 and 110 tons, which is at least ten tons a day in excess of the original estimate of the capacity of the mill.

Western Canada

Ford & Company will start a sash and door plant at Weyburn, Sask.

D. Hamilton has started a woodworking business at Wapella, Sask.

Wm. Cook, the prominent saw-mill owner of Mount Lehman, B.C., died recently.

The North Star Lumber Company of Birch Hills, B.C., has been incorporated.

S. A. Arbuckle, lumber dealer at Wellwood, Man., has been succeeded by Wm. Bruce.

The Doak Lumber & Manufacturing Company is building a planing mill at Saskatoon, Sask.

The Finger Lumber Company of Le Pas, Man., intend enlarging their plant so as to double its capacity.

The lumber mill owned by J. B. Winlaw at Winlaw, B.C., was destroyed by fire on June 18th. The loss will be about $40,000.

The Upper Fraser country of British Columbia has been devastated between Fort George and Tete Jaune Cache by forest fires.

The Far West Lumber Company Limited has been incorporated in British Columbia with a capital of $10,000. The head office will be at Victoria.

The Yale Columbia Saw Mill of Nelson, B.C., which was destroyed by fire last March with a loss of more than $70,000 will be rebuilt in the near future.

Red Wing Lumber & Supply Company, Limited, has been incorporated in British Columbia with a capital of $30,000. The head office will be at Victoria.

The Seattle Cedar Lumber Manufacturing Company has registered in British Columbia. The amount of capital is $85.000 and the head office will be in Victoria.

The Stone Lumber & Shingle Co. Ltd., have been incorporated in British Columbia with a capital of $10,000. The head will be at Pine Grove, British Columbia.

French Canadian Timber, Limited, has been incorporated in the Province of British Columbia with a capital of $1,000,000. The head office will be situated in the city of Vancouver.

The Dominion Equipment & Supply Company has been incorporated in British Columbia with a capital of $100,000. It will manufacture and deal in all kinds of timber, lumber and builders' supplies. The head office will be at Vancouver, B.C.

The next convention of the Canadian Forestry Association will be held in Victoria, on September 4, 5 and 6, on the invitation of the Government of the province. Premier McBride is enthusiastically forwarding the project and it is expected to be one of the largest conventions of the kind ever held in Western Canada.

The sash and door and planing mill of Brown & Rutherford, Winnipeg, which was recently destroyed by fire is being rebuilt. The temporary factory is now about completed. The building will be used as a warehouse when the permanent mill structure is completed.

The Pacific Machinery & Supply Company Limited, has been organized in British Columbia with a capital of $30,000. The head office will be at Vancouver. Their charter permits of their engaging in the lumber business.

The Barnhart Log Loader

has been in successful operation in all parts of the country for twenty years and never caused a complaint. We are now manufacturing a new Barnhart Loader known as **Model "12,"** which is specially designed for use in very heavy timber. This loader is built on the same lines as the old Barnhart Loader now known as Model "10" and which we still continue to manufacture. We are operating lumbermen, producing 200,000,000 feet of lumber per annum and we use the Barnhart Loader exclusively. Could we afford to do so if it were not the best? Write us for prices.

Above Buildings Covered With J-M Asbestos Roofing

The Cheapest Roofing

J-M Asbestos Roofing is lower in first cost than shingles, tin and slate and cheaper than all other roofings when cost per year is considered.

Tin, iron and most prepared roofings are a continual trouble and expense, for they have to be coated or regraveled every few years. No coating, gravel or other protection is ever needed for J-M Asbestos Roofing. Its first cost is the only cost.

J-M Asbestos Roofing

consists of layer on layer of Asbestos (rock) Felt securely cemented together with Trinidad Lake Asphalt. This makes a ready roofing which is literally a pliable stone—with the everlasting qualities of stone.

Sparks or burning brands cannot ignite it. Rain, snow, heat, cold, salt air or chemical fumes cannot injure it.

This roofing is in good condition today on many buildings after more than a quarter century of service. J-M Asbestos Roofing can be used on any type of building.

Write nearest branch for illustrated Catalog No. 303, and our special proposition to dealers.

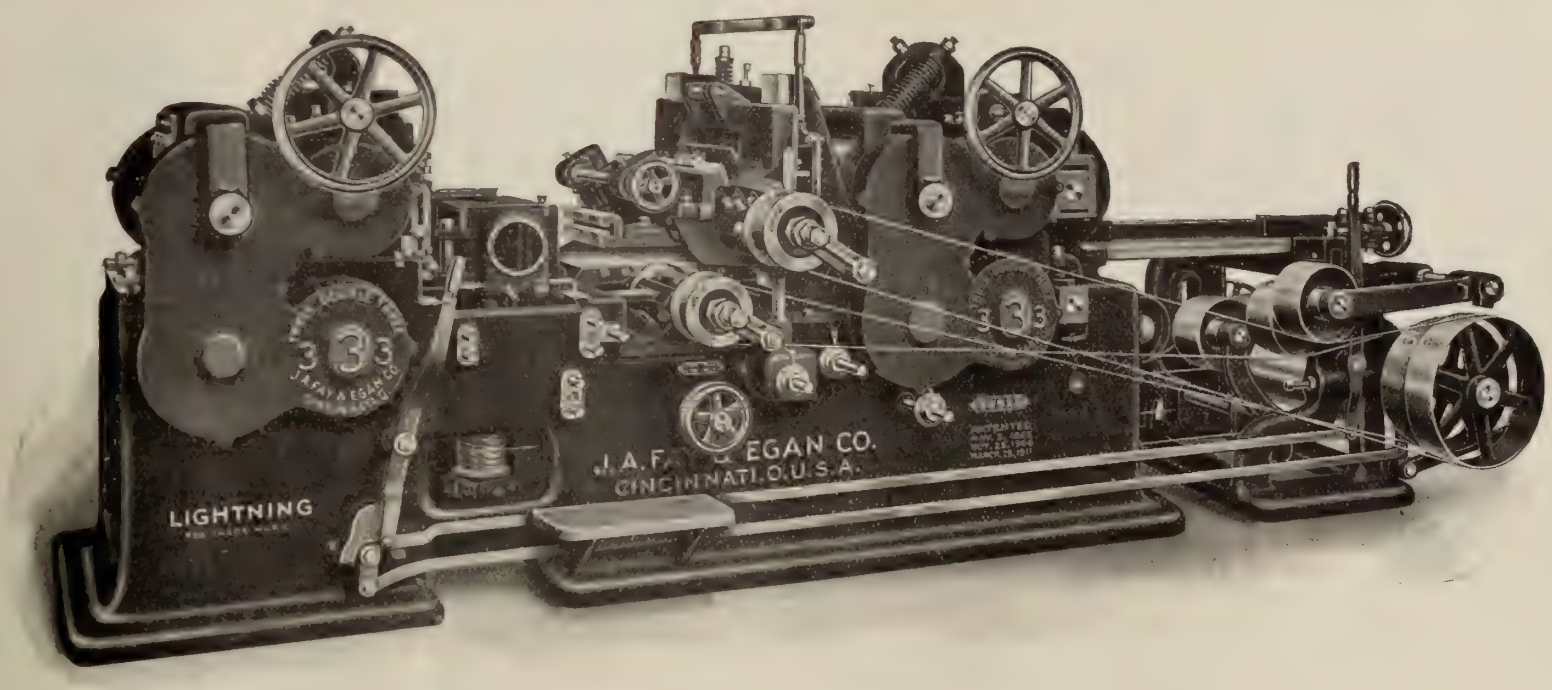
WRITE FOR ILLUSTRATED CATALOGUE



This is the FAY-EGAN "LIGHTNING" No. 333—the Matcher that produces the highest grades at the lowest cost per thousand feet—ten reasons for its success are—

1. The heavy frame cast in one piece—the countershaft, too, is cast in one piece separate from the machine.
2. Every gear cut from the solid and runs in grease.
3. Sight feed lubricators for cylinders and side heads—compression grease cups for all gears.
4. Feed rolls are 12″ in diameter, and powerfully geared.
5. You can get at every part and make every adjustment on this machine from the outside.
6. Automatic gravity tightener on the loose side of every belt.
7. Cylinders are round, with six air-hardened, thin steel knives—top cylinder driven by double belts direct from countershaft—bottom cylinder also driven by double belts direct from countershaft (not by friction).
8. Each cylinder has a jointing attachment always on and ready for use.
9. Side spindles double tapered for self-centering heads, and a side head jointed in the filing room will run perfectly.
10. A Profiler or Molding Attachment can be put on and can be set up and changed as quickly as any Molder—the bits can be jointed without removing the head.

We may be prejudiced—the mills that are getting the benefit of this Matcher are not—write us for catalog and we'll tell you where you can see one in operation.

RUBBER GOODS FOR LUMBERMEN

Belting—Our long experience in the making of Rubber Belts enables us to specialize on this line. "Monarch," "Red Strip" and "Lion" are our leading brands for power transmission. (Write for Booklet B-1.)

Packings—"Redstone" High Pressure Sheet Packing has proved by test that it will outlast any other similar packing on the market. We make Spiral and Ring Packings, etc., that are equally reliable. (Booklet P-1.)

Hose—for Steam, Water, etc., etc., in various grades, made especially to give satisfactory and economical service under different conditions. (Booklet H-1.)

Fire Hose—One or more of our twenty brands of Fire Hose will be found, not only in the best equipped Factories, Mills, etc., but in almost every Fire Department in the Dominion. (Booklet H-1.)

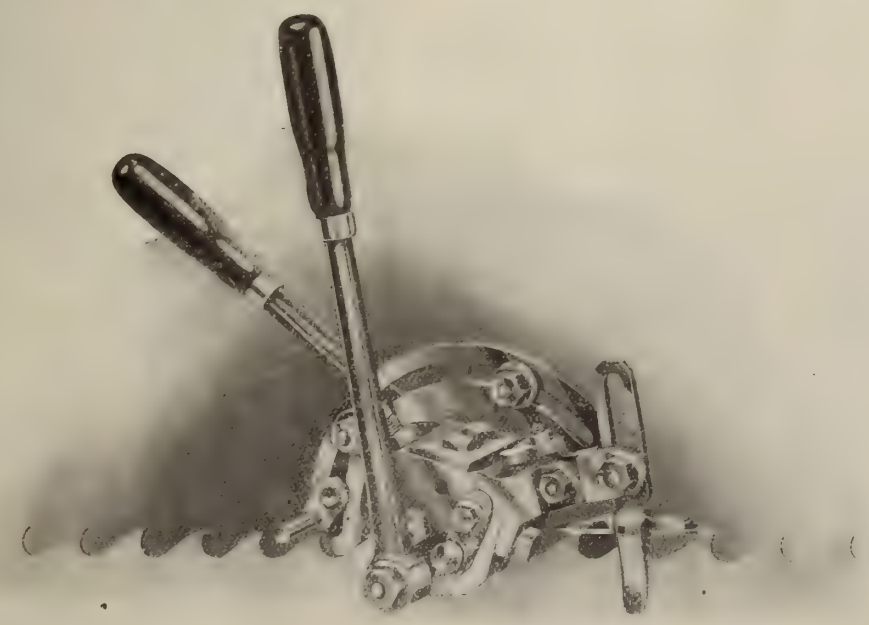
Hanchett Band Saw Swage



WE have been right here "sawing wood" for nearly 20 years. The number of swages turned out each year is greater than the year before. Let us send you one on trial. If it don't please you send it back at our expense. It won't cost you a cent to try it. Our new spring brackets and die lever stops fit all Hanchett Swages. Ask for catalog No. 5—just out.

"HANCHETT SWAGES DO GOOD WORK."

34

American
No. 34 Inside Moulder

Do you want a copy of our No. 34 Moulder Book?

It's a high class piece of advertising telling about a high class piece of wood-working machinery. We venture the assertion that the American No. 34 has no equal; but its reputation will not rest on our assertion, but rather on your judgment,—the judgment of the trade.

We leave it to you. Get the book.

It's a *fast feed machine*—It resembles our No. 77 Planer and Matcher in that respect. It will manufacture siding at 150 or more feet per minute, and the heads are equipped with jointers for that purpose. It has every convenience and adjustment that the idea, inside moulder, suggests, and some new ones that you have never seen before.

The book is yours. Let us have your address for a copy of it. Sent free postage prepaid.

Make Your Power Transmission An Asset—Not a Liability

When purchasing Belting don't come to the conclusions quickly—the selection of a poor, cheap belt might mean considerable loss of power and efficiency in your plant.

Beardmore Belting will save you this trouble and loss—it will also wear better and last longer than any other belting on the market.

Beardmore Belting represents the maximum value obtainable in leather belting.

Made only from extra selected No. 1 Packer Steer Hides—tanned under the slow old fashioned process which positively ensures the long life of the belt.

Having everything under our supervision from the hide to the finished belt we are able to offer Leather Belting that we can fully guarantee.

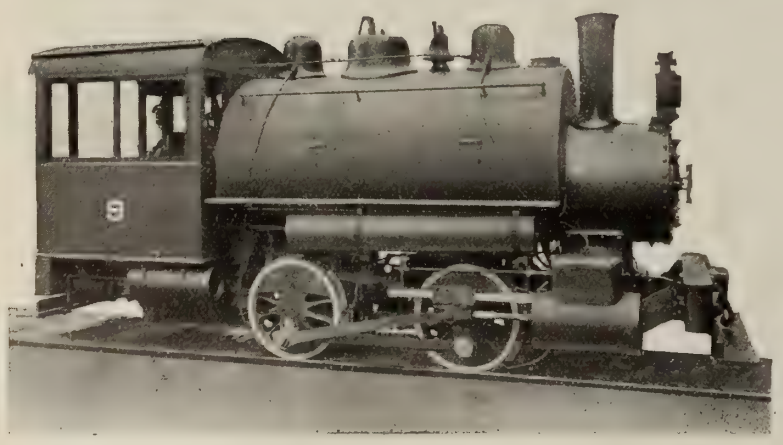
INDUSTRIAL LOCOMOTIVES

FOR BURNING COAL, WOOD OR OIL



Our locomotives are not built for one job only. They are built to last for years in the hardest service with a minimum expense for upkeep. This is the only proper way to build them.

Facility for making repairs when parts wear out was carefully considered in the design of our standard locomotives. Every detail is made with a view to securing the greatest possible reduction in the expense of repairs. Interchangeability reduces the time the locomotive is idle when repairs are necessary, as like parts will fit any other locomotive of the same size and design.

Consider the reduction in your profits when your locomotives are waiting for repairs.

Interchangeable parts, sure to fit, are kept in stock at all times and can be shipped at short notice.

MONTREAL LOCOMOTIVE WORKS

Dominion Express Building, MONTREAL, CANADA

Makes It's Mark Vivid and Lasting

Marks that remain vivid and wear like iron are a real satisfaction to the man who handles lumber. The metallic pigments, like graphite, of DIXON'S LUMBER CRAYONS offer marvelous resistance to all kinds of weather conditions. Their marks are often visible after six months of severe exposure to sun and storms.

DIXON'S LUMBER CRAYONS

have always remained the recognized standard because of their one, uniform and dependable quality; their convenient and uniform shape and size and because of the careful selection of materials used in their manufacture. DIXON'S LUMBER CRAYONS are made in nineteen grades and colors, including black (six grades), red (two grades), blue (two grades), green, white, yellow, brown, terra cotta, violet, pink and orange. Some are made to fill particular needs—let us tell you more about them. Get acquainted.

Write for lithographed booklet No. 239, illustrated in colors.

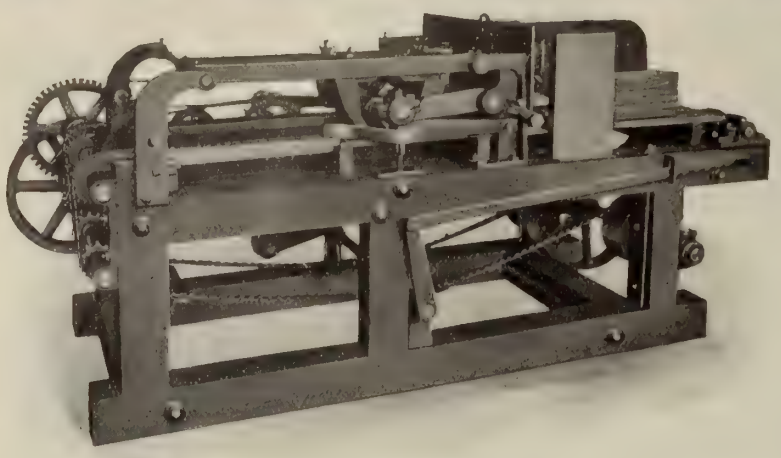
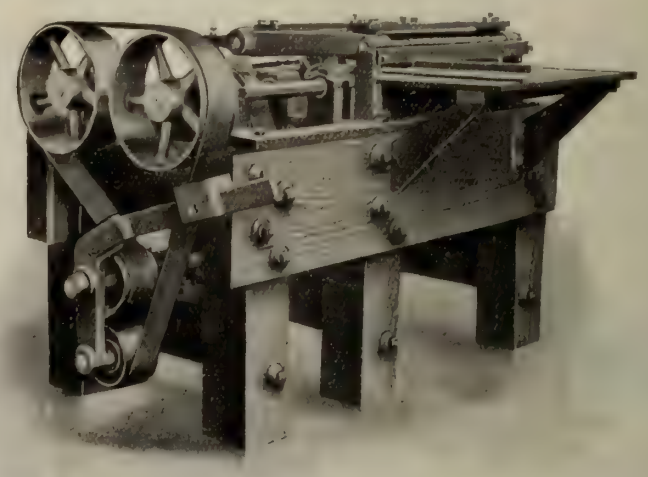
A Pair of Useful Machines



NO. 420 RECESSING MACHINE

Our No. 420 Automatic Recessing Machine will cut recesses with safety and dispatch.

Two boys will turn out more work than four men can accomplish of a similar kind on the ordinary cutter head most often used for the purpose. Will handle stock 20 inches wide by 30 inches long composed of one or more pieces, only occupies a floor space of 2 ft. 11 in. by 6 ft. 6 in.



No. 5 LATH EDGER

This No. 50 lath edger will enable you to use cheaper labor, less men per thousand lath and get more lath out of every slab handled besides getting number one lath out of thin slabs that would be worthless using any other system. The saws are spaced to rip one and one half inches wide. The first saw cuts one and one half inches from the guide so there is no waste on straight edge stock.

Send for complete catalogue of box machinery, resaw and saw mill machinery.

Mereen-Johnson Machine Company - Minneapolis, Minn.

JOHNSTON RE-SAW is a Lumber Saver and a Money Maker

The advantages of this machine over all others are;—1st—As a lumber saver using 10 and 12 gauge saws; 2nd—Can be set instantly to cut lumber from ½ inch to any thickness up to 4 inches: 3rd--Has screw adjustments so that thickness can be varied 1-12 of an inch under or over standard thickness, 4th—Automatic adjustment to prevent saw burning by slivers catching; THE FRAME being heavy is very rigid, so that saws can be run at high speed without vibration; THREE POINT driven; Three return live Rolls 8 inch by 20 inch automatic feed; Two grooved Rolls 8 inch diameter; one 16 inch adjustable Roll grooved; all gear: Power required 20 to 30 h.p: Weight 6,500 pounds: Floor space 8 feet by 9 feet 3 inches:

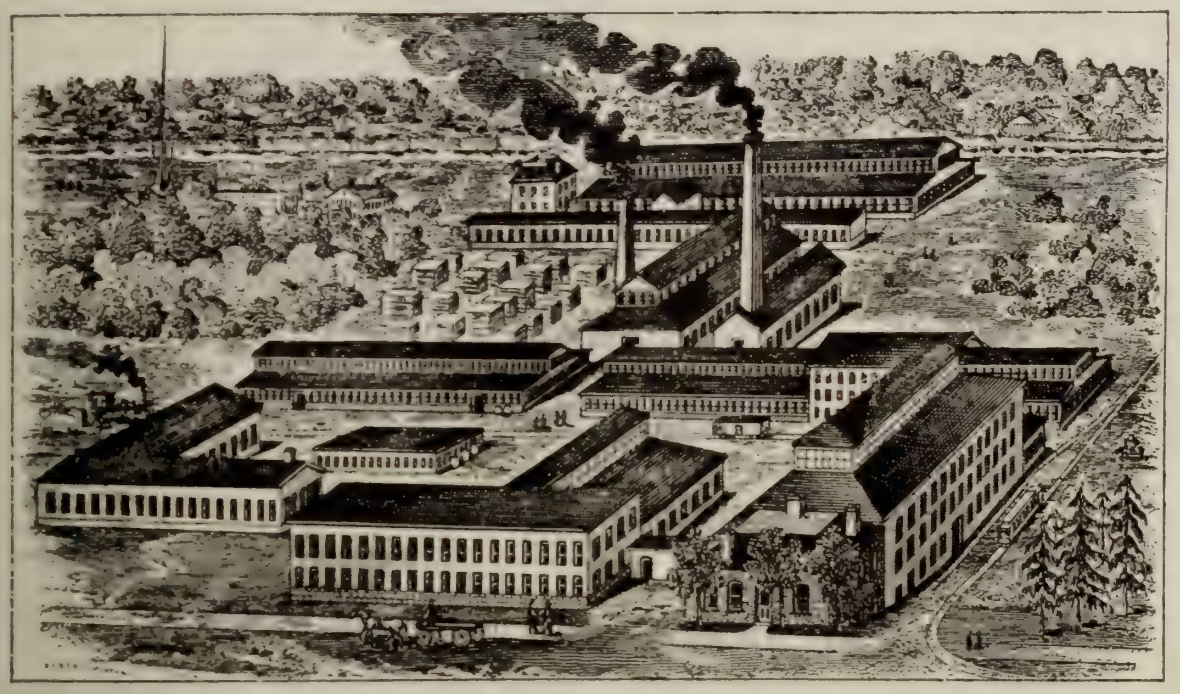
MAPLE LEAF SAWS

The Improved Racer Cross Cut Saw, by Actual Test, is the Fastest and Easiest Cutting Saw Made



The Maple Leaf saw is higher priced than the ordinary saw because it costs more to make it. It is made of the very highest quality of steel and tempered by a secret process which toughens and refines the steel. The Maple Leaf trade mark on the saw means that it is the equal, if not superior to any saw made. It also means that you are privileged to test it against any other make and if not found equal or superior in quality you can return it and have your money refunded.

The ambition of the manufacturers of the Maple Leaf Saws has always been to produce the best tempered saw in the world and they are constantly investigating and experimenting with this end in view. They have recently made some valuable discoveries in evenness of temper. It has always been difficult to get a perfectly even temper on long and thin sheets of steel, such as saws are made of. Our recent discoveries make this an absolute certainty. Every user of saws should bear in mind that the temper of the saw is its most valuable quality. High finish and attractive appearance amount to nothing if the temper is not right.

All Maple Leaf Saws are Guaranteed to be Perfect in Temper

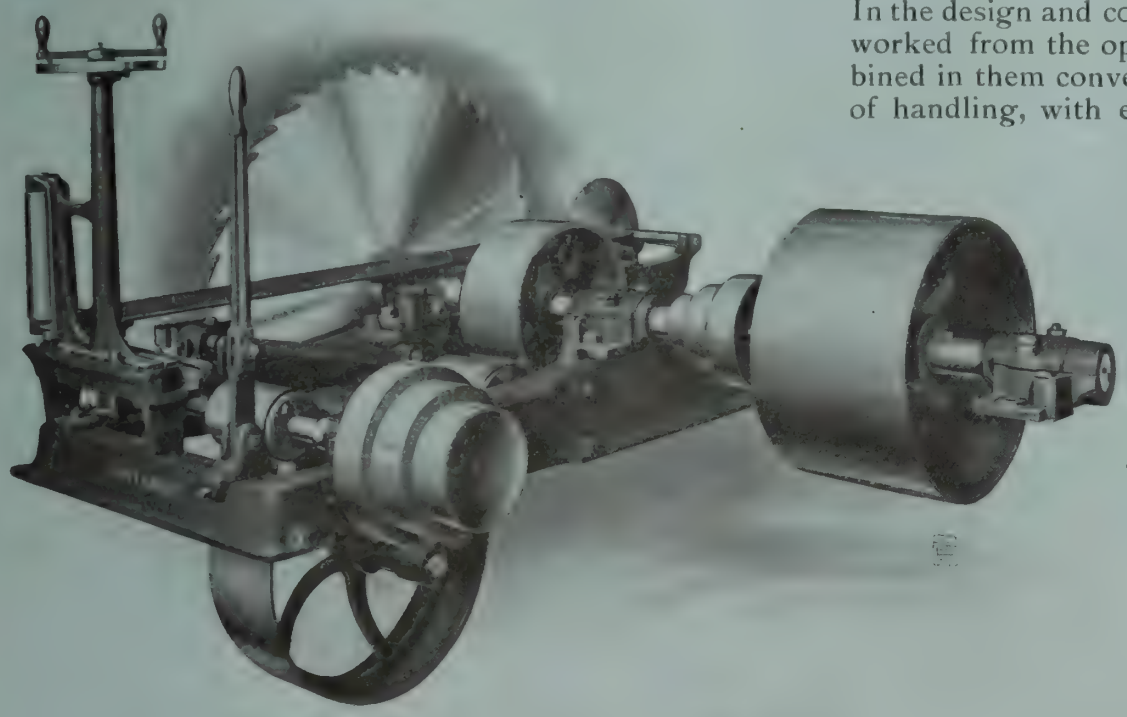
For Portable, Medium and Heavy Mills

WATEROUS Circular Sawframes are built to suit every mill size. Their capacity ranges from 2000 to 25000 ft. per day.

Every frame we build is supplied with a heavy mandrel of larger diameter than is the general custom. Three bearings are used to support it. Fittings include wide-faced powerful iron and paper friction feed-works, disc wheel splitter, timber guage, belt tightner, and rigid and quickly adjustable saw guide.

In the design and construction of these Frames we have worked from the operator's view point and have combined in them convenience, accessibility and simplicity of handling, with exceptional strength and accuracy.



Waterous No. 1 Sawframe—takes 60" saw—weight, 2300 lbs.

For many years the No. o Sawframe, which is shown in the cut above, has been sold as part of our Portable Outfit, and its indorsement has been universal. The heavier Frames of cast iron and steel construction throughout have also been given the test of years of actual service, and with improvements suggested by this use have made good wherever installed.

A new catalogue, No. 110, of Sawframes and Accessories only, has just come in from the printer — we have a copy here for you.

The Waterous Engine Works Co., Ltd.

Brantford, Canada

AGENT—H. B. Gilmour, Vancouver, B.C.

BRANCH—Winnipeg, Man.

$5,000,000.00

worth of mixed metals is what we market every year

PEERLESS metal is compounded specially for sawmills and is the best on the market for that purpose.

FAULTLESS metal is a high grade copper hardened alloy made for heavy duty work, sawmills and engines.

Our policy is large tonnage, perfect alloys, and absolutely fair and honest treatment of the trade.

We solicit your patronage

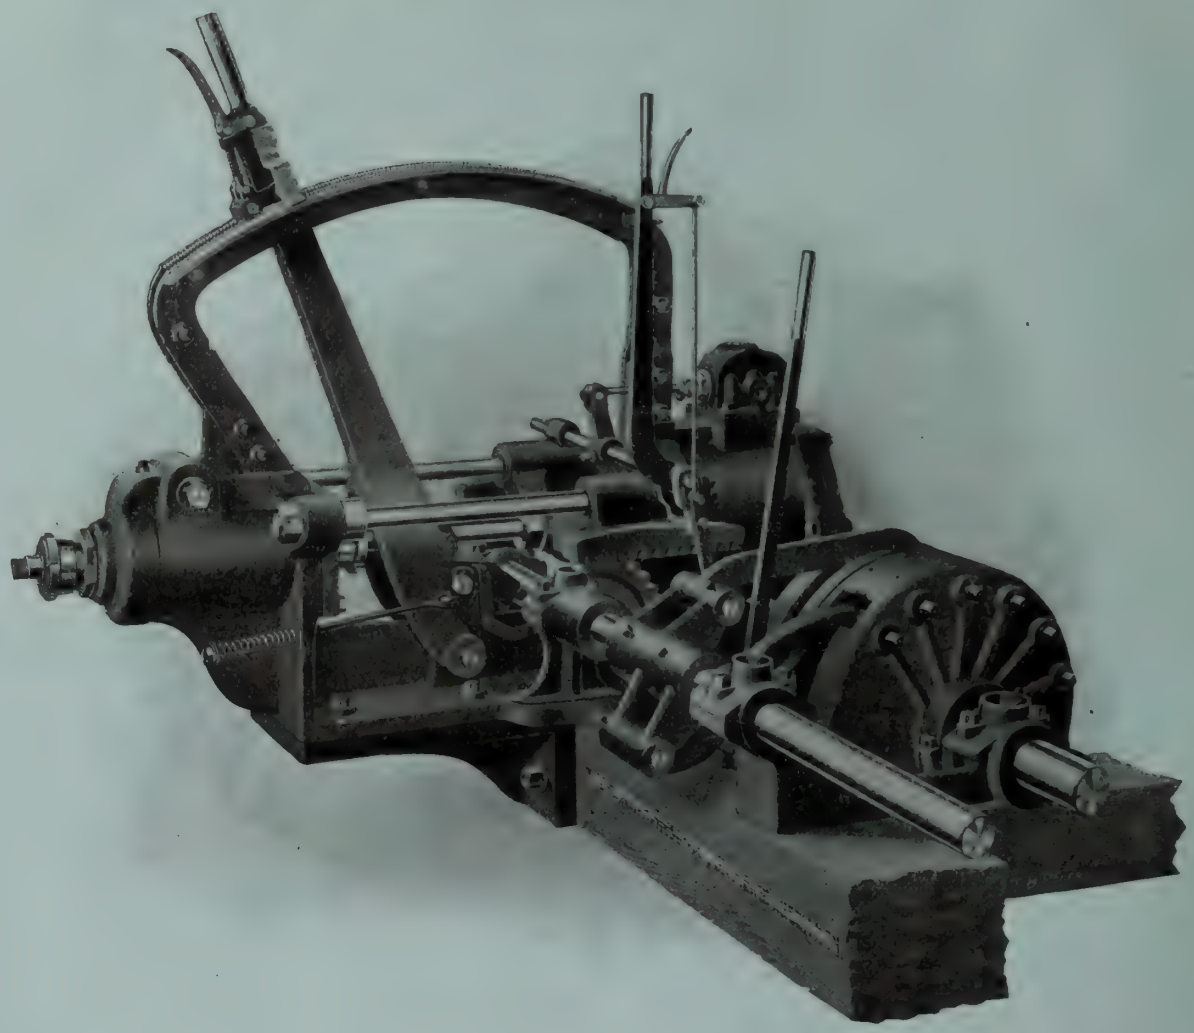
Alphabetical Index to Advertisers, page 60

Did you ever really figure what it means to you to increase your cut 2,000 feet per day?



That is, increase it 2,000 feet per day without adding to your cost of sawing.

Or, in other words, what effect will it have on your profits if you can distribute your overhead charges and wages over an output 2,000 feet per day greater than it is now?

If you haven't figured it out, take your pencil and try it now.

You know how much it costs you to run your mill every day—divide that amount by the number of thousand feet per day in your present output—add 2,000 feet to your present output and divide your daily cost by that amount—and the difference between the two results represents the saving per thousand feet in your operating cost.

Then multiply that figure by your total output per season—and we think the result will surprise you, if you have never looked into this before.

This is just one of the ways in which our FOUR INCH STEAM SET WORKS will make money for you, and it will do just this because the users themselves have written us stating that they have increased their cut *upwards* of 2,000 feet per day.

May we send you further information about this Steam Set works?

Timber Limits for Sale
on Georgian Bay

The undersigned offer for sale in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont. ; Tug Scow and other Lumber Equipment, including boom chains, plows, sleighs, etc.

The Limits, part of which have recently been sold, include : 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows : Saw Logs, White Pine,$1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

The Parry Sound Lumber Co., Limited

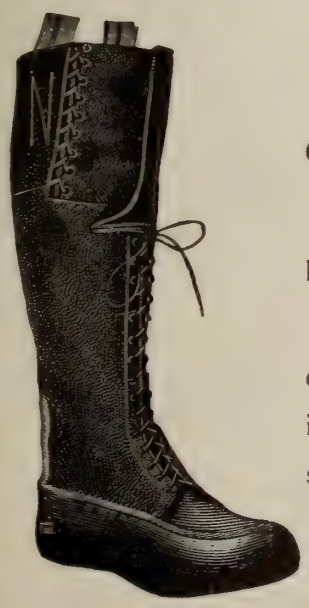
PENETANG SHOEPACKS

Gendron Penetang Shoepack Mfg. Co.

Sole Manufacturers, Penetanguishene, Ontario



TO THE TRADE

Gentlemen :—

We take this opportunity to advise you that shoepacks must necessarily advance in price in the near future, owing to the great advance in hides and leathers of all kinds.

We would ask you to place your order for fall at once, as we anticipate a larger demand than ever, and although we have made preparations for almost double the increase in our output, those of our customers who neglect placing orders, may be disappointed in shipments, besides running the risk of having to pay the advanced prices.

Yours truly,

GENDRON PENETANG SHOEPACK MFG. CO.

“EVERYTHING IN LUMBER”

Why not make 1912 the most profitable saw year in your history?

ATKINS STERLING BAND SAWS

Made in Canada

THESE Saws are celebrated on account of their exceedingly tough temper and generally scientific construction. They will stand up to their work longer under the most trying conditions. You will find fewer cracks in ATKINS BAND SAWS than any other and they will hold their teeth and points remarkably. Why not place a trial order and make us prove these statements.

Write to-day

GARLOCK PACKINGS

Garlock Regular Rings

For all general purposes outside of high pressure work. This Packing is a special grade thoroughly lubricated with the celebrated "Garlock" compound, and is the perfected result of over thirty years experience in manufacturing fibrous Packings.

Garlock Square Duck Packing

Made of good quality Cotton Duck and friction for cold water.

Garlock High Pressure Gaskets

Absolutely heat proof, will not vulcanize or blow out under any steam pressure, being made of long fibre Asbestos Brass Wire Insertion.

Garlock Red Sheet Packing

Made of high grade Rubber compounded in such a way as to give it great strength and reliability.

This Packing has established wide reputation on its own merits.

Garlock Cloth Insertion Sheet

Used on cold and warm water pipes. Is unexcelled in pliability, smoothness of finish and strength of Cloth Insertion.

Garlock Rubber Valves

Specially made to meet specific conditions—absolutely unaffected by oils.

Before placing your next order for supplies get our prices on Leather, Rubber and Canvas Belts, Hose, Brass Valves, Babbitt Metals, Saw Blades, Files, Emery Wheels, etc. A full stock carried at our Western Branch, 117 Market St. East, Winnipeg. Write for catalogue.

It is Better to Buy

the best; this applies to anything one needs, but especially do you require

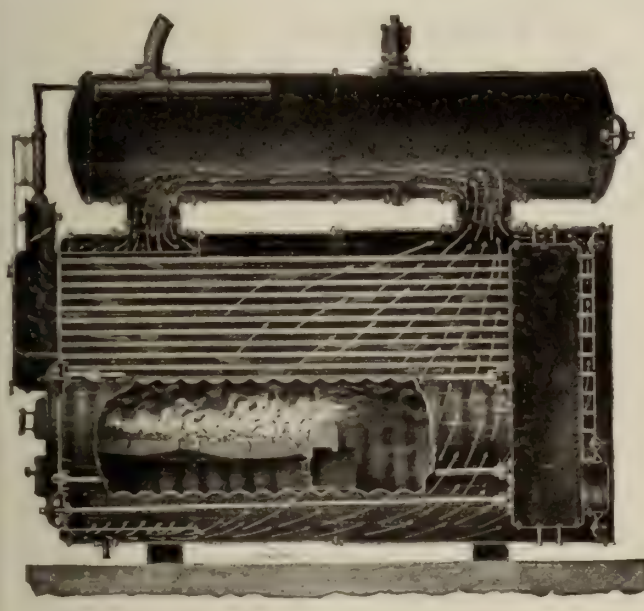
Good Machinery and Supplies

The best is none too good, at any time, and while it perhaps costs a little more at the start, it is the cheapest in the end. The price paid for a cheap article, is probably not only all it is worth, but a great deal more, so it is wiser to get the best,

Than to Wish You Had

Think it over, then send to us.

AUSTEN BROS., Limited, Halifax, N.S.



The Internally Fired Scotch Marine Boiler Now Available for Plants Ashore

It changes the sluggish flow of water into rapid circulation and does it without a pump or other device.

Rapid, positive circulation is the chief feature—others are: cylindrical combustion chamber which eliminates crown bar or girder stays; less cost because two small thin shells take the place of the one large drum, and the staying is simple.

Make your power transmission an **asset** instead of a **liability**—a money-saver instead of a power-waster. Belt your machinery with

GOODYEAR

Imperial

High-Speed, Friction-Surface

BELTS

"The Belt That Clings"

Built the famous Goodyear way, for high-speed pulleys where great tensile strength is demanded

The Imperial has the cling of rubber and the endurance of many plies of hard-twist, long-fibre **cotton fabric,** rubberized, cured and vulcanized into one solid, enduring piece.

Earns Cost—Costs Less

The Imperial Belt is a power saver. It earns its cost by turning into increased production the power and the time lost by slippery leather belting. And it costs less.

Wears Longest Without Stretching

Most economical because it wears longest.—First, because it doesn't slip. Secondly, because it is made by a process that abolishes **internal friction.** This soon wears the life out of the best leather belting and is caused by internal **grinding** as the belt bends and whizzes around small-high-speed pulleys.

Instead of a few plies of coarse fabric, we build up the Imperial with many plies of fine fabric. After the **stretch has all been taken out,** rubber is forced through and all threads are separated from each other. Thus they can't rub and chew themselves, and the cause of internal friction is eliminated.

These belts are built to suit the purchaser. Let us quote prices on this most durable and economical high-speed, friction-surface, wear-resisting belting.

We also make other rubber products—Tires, Hose for all purposes, Sheet Rubber Packing, etc. Throughout, you get the same high quality materials, skillful workmanship and years of experience that have built such famous service into products of the Goodyear Tire & Rubber Co., Akron, Ohio, U. S. A. Our sales of the last four months 50% greater than those of last year. Defective goods returned only $23.93. Write us at once.

Simonds Saws

All there is to a Saw is STEEL, SKILL and STYLE.

The Steel that is in a Simonds Saw has meant that to supply it we had to build a Steel Mill comprising seven buildings which, with yards, cover 14 acres of land. This much for the demand for Simonds Steel.

The Skill that is in a Simonds Saw requires for its operation three complete factories, one at Fitchburg, Mass., one at Chicago, Ill., and one at Montreal, Que. The skill is the result of noting and accepting improvements in methods of Making Saws, as long as Saws have been made in this country.

The Style that is in a Simonds Saw comes from a close study of the style of Saws necessary for best cutting results under varying conditions. Years of experience in the Saw manufacturing business has developed an ability to select the right Saw for any particular use.

The Price that the Consumer pays for a Simonds Saw entitles him to the benefits of Simonds Steel, Skill and Style, these three together giving results or service which means profit.

If you are in the market for any kind of a Saw, Planing Knife, or file. send your order to our nearest office for our immediate attention.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 32 Toronto, July 15, 1912 No. 14

A Preference for Canadian Lumber

The details recently made public regarding the agreement for reciprocal trade preference between Canada and the British West Indies render it practically certain that the agreement itself will be ratified by all parties concerned. To the people of the Maritime Provinces the agreement is of great importance and it is looked upon as the beginning of a great development in trade between Canada and the British West Indies. So far as the lumber trade of Canada with the British West Indies is concerned, there will be some benefit as a result of the agreement, although comparatively speaking it will be slight. The most important market for Canadian lumber in the West Indies is Barbados, and the total shipments to that island only amount to between four and five million superficial feet annually. It is interesting however, to note the actual results which are likely to follow the agreement.

At present the duty on lumber entering Barbados is $1.20 per thousand feet. On lumber entering Trinidad the duty is $2 per thousand feet. The reciprocity treaty will give Canada a preference of at least 20 per cent. The new duty for Barbados will therefore be 96 cents per thousand feet at most and for Trinidad $1.60 at most. It is understood that the agreement is to go into effect on January 1st, 1913.

The Maritime Provinces have practically enjoyed a monopoly of the lumber trade with the West Indies for a long time. Years ago, when our lumber was secured from large logs, an attractive profit was made in the trade but the conditions to-day are far less favorable. To account for this, it is necessary to consider the conditions under which the trade is carried on. The West Indian merchants insist upon their purchases being based upon the same system of measurement as that which was in vogue when larger logs were secured and larger sizes of timber were easy to obtain. The West Indian method of surveying or estimating lumber in fact, is based on conditions which no longer exist. To-day our logs are smaller and are cut into shorter lengths than formerly. The West Indian merchants buy one-inch lumber only and they demand that merchantable lumber shall contain at least 10 feet per board, a specification which is difficult to get to-day. Not being able to get much lumber of this size, the merchants insist upon a discount from the price in proportion to the amount of under size. When one who is not experienced in the West Indian trade first sees an offer for Canadian lumber it strikes him as a handsome price, but when the shipment has been subjected to the West Indian survey the original price looks like a delusion.

Having a practical monopoly of this trade it seems peculiar at first that Canadians should put up with these conditions. The truth of the matter however, is that lumber shipments are often made as a part only of a cargo for the West Indies and that the most valuable cargoes in the West Indian trade are those which come to Canada from these islands. Under such conditions Canadian merchants are glad to get a cargo of any sort for their vessels on the return trip. Whether prices for lumber are good therefore, or not, it pays to ship lumber and other Canadian products to the West Indies, so as to give the vessels a return load.

Under the new reciprocal trade arrangements it is more than probable that Canada will secure a great deal of the West Indian trade in flour and other products which hitherto has gone from New York. Our return cargoes are therefore likely to occupy a more important position comparatively speaking than they do at present and, with a better steamship service between Canada and the West Indies, the whole system of trading is likely to undergo important changes. In this connection it is interesting to note that credible reports state that the government intend to call for tenders for an improved steamship service and that the C.P.R. is credited with an intention to tender. It is possible that the Quebec Steamship Company which at present handles a great deal of the United States freight for the West Indies will have to transfer its business to Canadian ports. Altogether the reciprocity agreement involves many interesting developments for the people of the Maritime Provinces, and the lumber trade, though small will be effected proportionately with the others. One cannot help wondering who will benefit from the reduction in the duty on lumber. In the absence of competition, the chances of the consumer securing the benefit seem slight. The importer or the shipper seem likely to share it, in proportion to the urgency of the demand, and as the shipper in Canada has not made much out of this trade in the past, he may entertain some hope of getting better terms, when the duty is less.

The Cost of Selling Lumber

Within late years a quiet but important change has been coming over the methods of selling lumber, a change which has a definite and vital bearing upon the present situation and the future development of the lumber industry. It is not many years since a number of the most important lumber firms in Canada sold most of their lumber by correspondence. They were able to advise their regular customers that they had certain classes of stock for sale at certain prices and to depend upon receiving orders for a large block of stock in reply. Large quantities of lumber, involving sometimes the whole cut of a mill, were disposed of in this manner. Some firms have been able to continue the same practice up to the present, largely as a result of the good will which they have established among their customers by the quality of their lumber and their business-like methods of carrying out their contracts to supply stock. The cost of selling lumber in this manner was a great deal less than the cost of placing travellers upon the road or of selling through the wholesale houses and giving a commission upon all stock sold.

Conditions which prevailed in the earlier days of the lumber industry in Canada favored this method of business. Business methods, however, have passed through a period of evolution which has been coincident with the extension of transportation facilities. The change has been a natural one growing out of natural alterations in our ways of living and it has brought with it a growing dependence upon personal effort to secure and keep customers, which would have

been considered a waste of time and energy in earlier days. Not that there is any more natural politeness in the business methods of to-day. The balance in this regard is probably on the other side, but competition has grown so much keener that politeness and keenness have become more important factors in successful selling than they used to be. Intensive methods of selling have come into general use along with the increased production rendered possible by the great improvements which have taken place in the productive capacity of machinery. Increased production and a widening of the demand for lumber have produced a far more sensitive nerve organism in the business world. This sensitiveness is seen particularly in the readiness with which market conditions are affected by adverse or favorable conditions. We are in touch with conditions in all parts of the world and are able to learn of market conditions with wonderful facility. This was a factor in bringing about the depression which was so widespread during 1907 and 1908, a depression which was in itself a contributing cause in the changes which have taken place since then in selling methods.

The days of expensive selling methods seem to have passed. Even the firms which continue to depend upon correspondence for the sale of their stock now find that it takes many more letters than formerly to land an order. Customers who used as a rule to send in their orders as soon as they received a letter telling of the stocks for sale, now frequently send a polite reply to the effect that they have already secured their stocks. The man who has sold them the stock is probably the fortunate one who happened to make a call at the time when the company considered that they needed the lumber. Personal solicitation for orders seems in fact to have become the universal method of securing business. Lumber salesmen have become so numerous and so ubiquitous that the buyers of lumber have found their facilities for securing stock greatly increased. So easy has it become, in fact, to secure lumber, that the habit is far more general than formerly to stock up only with what it actually needed for immediate trade. In the old days the problem was largely one of producing the lumber. The selling looked after itself. To-day it is a problem all along the line from the log to the disposal of the finished stock. It is not stretching the truth to say that lumber is often sold to-day at a cost several times greater than the cost of ten or twenty years ago.

In view of these facts the situation has an important bearing upon much of the discussion which is heard regarding the increased cost of living and the part which the higher price of lumber plays in the problem. This discussion often omits any consideration of the interesting factor involved in the increased cost of selling. Higher cost of labor and materials and increased transportation rates are generally remembered in the discussion. The cost of selling, however, is unquestionably a most important factor. It cannot be lost sight of in making a just estimate of the situation and it will be found that the increased cost of selling, together with increases in the cost of labor and materials go a long way to account for the higher price of lumber. During the years which have intervened since the depression of 1907 and 1908 the return to the manufacturer of lumber has not by any means been commensurate with these increases in the cost of producing lumber.

The advance in the cost of selling lumber is responsible for the close study which is now being given to the question of publicity. Nothing to-day is of greater importance than a successful method of conveying to prospective buyers a knowledge of the attractive qualities and prices which a firm is able to offer. Publicity is of many varieties and the problem of selling is to discover the most effective method of publicity. No matter in what way the problem is solved, it is entirely one of telling the customer either by letter, by personal canvass or by the use of advertising space in trade journals, all the good points of the product for sale. In trade journal advertising everything depends upon making good use of the space purchased. The circulation of the journal will always do its part in selling lumber but it cannot show its best results without intelligent arrangement of the arguments published. By trade journal advertising, properly conducted, the cost of selling lumber can be reduced to something fairly close to the cost of the old method of correspondence. This is not stated by way of advertising the trade journal. It is a simple fact which can alone account for the wonderful increase in the use of advertising space which has taken place of late years. The object of referring to the use of advertising space is to bring home the fact that the spirit of the times has vastly altered within a few short years and that although it costs more to sell lumber to-day than it used, it is still possible by good selling methods, to keep the cost relatively low. The combination of a keen selling staff and a well-conceived and executed advertising plan will enable any firm to bring down its selling cost to a figure surprisingly close to the cost which prevailed when lumber sold itself and the trade journal and the expert salesman were in their infancy.

Instructions to Employees—Their Importance

A cabinet maker of the old school was one day working upon a table when a neighbor called upon him and found him polishing the under side of the table. The neighbor's curiosity was aroused and he asked the cabinet maker why he was wasting his time polishing a part of a table which no one would ever see. "Perhaps no one would ever notice the roughness there," replied the cabinet maker, "but I would know it was there." This is unlike a custom which has been imported into manufacturing by the competitive methods which have developed of late years. So great has competition become and so accustomed have the buyers grown to looking for bargains resulting from competition, that the bargain-hunter to-day is surprised, like the cabinet maker's neighbor, when he finds that work has been done upon an article which does not increase its utility but simply adds to the sentimental value.

In many respects this policy of putting on only so much work as is required in order to give the article its necessary utility and outward finish, is a matter for regret. It is a habit which is certain to grow upon the workman and to reduce both his ability and his pride in the work performed. There is nothing which will conduce more to the creation of a good reputation in the woodworking business than a conscientious attention to details. A reputation built up in this manner is of distinct commercial value and enables a workman, or a firm, to secure a better price for their products and also to depend upon regular trade. In the management of a woodworking institution much depends upon the ability and conscientious application of those who are in charge of the workmen. The workmen will, in practically every case, adapt themselves to the demands which are made upon them. For this reason it is important that their instructions should be definite and thorough. With complete and accurate instructions there is little danger of a workman going astray, and if in addition he receives his instructions promptly it is certain that every good workman will turn out his products properly and on time.

Looking at the other aspect of the case, it is easy to recall cases without number in which a fair workman has come to grief simply because he has been left in doubt by those whose duty it was to instruct him. A workman's intentions may be of the very best but when he is not quite sure as to what is required of him there is every probability that he will not be able to give steady satisfaction. With direct, complete, and careful directions, a workman is relieved of all anxiety regarding the result of his efforts and is able to devote every bit of his thinking power to the actual production of a perfect product. Under conditions of this nature he will not only turn out good work but he will develop a higher standard of craftsmanship. Unquestionably, a woodworking institution which wants to turn out satisfactory products and to build up a profitable trade must see that its workmen are freely given the counsel of perfection. Not that perfection will ever be attained by any of them, but it will be so nearly approached that it will take a sixth sense to discover any shortcomings.

One of the most vexed problems in connection with the manufac-

ture of lumber is the apportioning of the cost of manufacture between the various grades of product from the log. One will hear this question discussed wherever lumber is manufactured and it does not happen very often that the same opinion is given by two people at the same time. Nevertheless, there is a fairly standard practice among sawmills which amounts to pro-rating the total cost of the product at the tail of the mill between the different grades of product, according to what may be considered to be their respective commercial values. In an interesting article upon this subject the American Lumberman recently referred to the matter as follows:

If the average value is $12 and the average cost $9 a thousand, a grade valued at $16 would have $12 cost charged against it, and if culls are considered worth $8 a thousand they would bear $6 cost.

This advalorem apportionment of cost is necessary as an arbitrary plan because the costs have been applied directly to the entire log before it has been separated into its various grades of product. The same theory would not, however, support that plan of apportioning costs upon the various grades of lumber after they have been separated. A plan that involved the charging of 75 cents for dressing No. 3 and $1.25 for dressing No. 1, regardless of what the actual planing mill costs were, might tend to the securing of a better price for the No. 1; but it might tend also to selling No. 3 at an actual loss. As a matter of fact, it probably has actually cost more to dress the machine knives, and perhaps also a slower feed. If the No. 3 dressed can not be sold for enough more than in the rough to pay the actual and not a false cost of dressing why not sell it rough?

A similarly interesting question relates to the practice of charging initial cost of the logging railroad to the timber account instead of burdening log transportation with it. It is claimed that by this means it is more clearly evident how poor a log it will pay to bring out to the mill, charging it with no stumpage cost (because had it been wasted it would have borne none), but only with the actual cost of getting it out to the mill, which is apparently smaller under this plan of accounting.

This is an interesting proposition and one that has some merit; but not to the extent which the above statement would suggest. In the ordinary cost of such an operation there would be a charge for depreciation of main line, perhaps of about 15 per cent., including interest on investment and a sinking fund intended to wipe out the original investment in about ten years. This involves the theory that at the end of the ten years the road will still be in good physical condition and available for further use.

As distinguishing from other industrial lines having an indefinite period of usefulness, however, the logging road will, when the timber is cut out, be still in physical condition, but there will be no further need of it, and its value will be practically extinguished at that time. Another factor of depreciation is added by this fact.

This factor of obsolescence is a proper loading upon the amount of merchantable timber to be brought out over the line. If the value to be extinguished is $45,000 and 450,000,000 feet of timber are to be brought out over the line it amounts to 10 cents a thousand on that timber. It is not affected by the fact that the operator elects to bring out 5,000,000 feet of additional low grade logs not considered as merchantable in the sense of bearing their proportion of stumpage cost, but considered as possessing sufficient value at the mill to pay their actual costs. These logs need not bear this 10 cents obsolescence burden.

The other factor of depreciation, however, taking care of the cost of repairs needed to keep the line in original condition of efficiency, relates to time and use. It increases with the length of time that it is necessary to operate the road to bring out the timber, and with the amount of timber to be brought out. Suppose the operator is hauling 5,000,000 feet a month out of the 450,000,000 feet of merchantable; if now he changes his policy and brings out 500,000 feet of "available waste" timber it is clear his monthly operating cost of railroad will not decrease, and the month's operation must still bear the same burden for repairs, but the amount of merchantable logs hauled will be reduced to 4,500,000 feet. If it cost $10,000 to operate the trains and $2,000 to maintain the line and extend spurs to each new timber cut during the month, the half million feet of available waste must bear not only $2 a thousand train cost but 40 cents a thousand maintenance of line cost; otherwise a larger apportionment must be charged to the merchantable logs, and one has the proposition of making his regular log supply cost more than it otherwise would in order that his account for saving the "available waste" logs may show a false margin of profit.

The 10 cents a thousand charged upon the merchantable timber as above suggested takes care only of the value which will be extinguished in the railroad when the timber supply ceases, and does not take care of the $45,000 originally invested in the road, which is a different factor. The foregoing suggestion proposes to charge this original investment directly to timber account as an added cost of timber. This gives opportunity for discussing some very complicated cost factors which it may not be profitable to take up here; but it is evident that where the logging road operates as an incorporated common carrier, or even as a separately incorporated private line, such a plan could not be followed.

However, it may be well to point out that the line of division between merchantable timber, that of sufficient value to pay both stumpage costs from stump to mill, and the "available waste" which can not bear its share of stumpage cost but can bear the cost from stump to mill, and can therefore be saved—the line of division between the two classes—varies as the cost of stumpage varies.

If the tract cost $1,125,000 and contains 450,000,000 feet of timber of sufficient value to bear a stumpage cost of $2.50, that will be the amount of stumpage, and the cost of stumpage per thousand feet. But if by charging in $45,000 cost of logging road one raises the cost of stumpage to $2.60 it may be that of the 450,000,000 feet of timber there will be 5,000,000 feet, or approximately one per cent., of the lower grades which thereby cease to be merchantable and become "available waste"; so that while devising a system which will enable one to save more of this waste by reducing the costs which it must bear to get to the mill, he is also at the same time increasing the amount of the waste which must be saved.

Undoubtedly as a practical fact many logs are left in the woods which could profitably be brought out. Undoubtedly, also, many logs are brought out which produce an actual loss, and the proposition is one which needs careful study. It is obvious that the actual costs must be handled in a manner which will produce true and not false results, and this applies to the saving of waste in the woods or at the refuse burner. Many a piece goes to the burner which has already gone through the entire sawmill process, or which needs but a single additional operation costing perhaps 10 cents a thousand feet to fit it for a low grade lumber use. It is clear that such a piece may be saved if it will meet the cost of handling from the tail of the mill, perhaps $2 a thousand on car at the mill dock, without requiring it to meet the sawmill cost of $2.50 or $3 a thousand. Often the same manufacturer who from a false motive of economy is losing money on bringing out trashy logs is at the same time sending to the burner a lot of low grade lumber—and lumber of the highest grades lacking only in length—which might well be saved and utilized by a little sensibly directed effort.

An important Government matter affecting manufacturers in British Columbia is the order for customs inspectors to seize all imported shingles marked as British Columbia red cedar shingles. These shingles are manufactured in Washington and Oregon and shipped into Canada under the brand of B. C. shingles, and since the order was issued several carloads have been seized.

Employees of the Defiance Machine Works, Defiance, Ohio, held their annual picnic on July 4th last, at Island Park, on the Mawmee River, near Defiance. The employees and their friends to the number of one thousand attended, and a very enjoyable time was spent by all. Addresses were made by Mr. Kettering, the manager of the firm, and Mr. Chas. Seymour. Music was furnished by the 6th Regimental Band. It is the intention of this firm to make their Employees' picnic an annual event, as it helps considerably to spread a spirit of harmony between employer and employee.

High Freights Reduce Maritime Trade

Ocean Tonnage from New Brunswick Ports Eliminating Profits and Creating Possibilities of Reduced Cut Next Winter—Extensive Jam on Miramichi

By the Editor of the Canada Lumberman

Campbellton, N.B., July 5th; (Special correspondence of the Canada Lumberman): The lumber trade situation on the Restigouche River is in a large measure dominated at present by the high rate for ocean freights for shipment to Great Britain. Recently a charter was secured at 53s. 9d. per standard from New Mills, a Restigouche port, to the west coast of England. This is a low rate relatively, the prevailing rate being 55s. Last year the shipping season opened with rates at about 32s. 6d. and they advanced during the summer to 39s. 6d. Since then, up to the present, the rates have been advancing further, and to all appearances the end is not yet in sight. What this will mean to the lumber industry on the Restigouche still remains to be seen, and depends largely upon the future course of freight rates. There has seldom been a time when high freight rates could be a more regrettable factor than they are during the present year. The manufacturers are now in a position to produce lumber more profitably than they have been for a long time. Their drives came out with scarcely a hitch, and every company operating on the Restigouche is in an enviable position so far as a large supply of logs secured at a relatively low cost can make their position enviable. The markets in England are more active than usual and are in need of New Brunswick spruce, but the cost of transportation is almost prohibitive.

Up to the present, shipments to the old country have kept up fairly well in spite of the high rates, as manufacturers have preferred to ship their stocks and to hope for lower rates toward the end of the season, by means of which to average up their profits. Unless such an improvement takes place there is a practical certainty that next winter's operations in the woods will be greatly lessened. Already one hears reports that the logs now on hand will not all be cut during the present year. This is the only reasonable result of the present situation as no manufacturer can be expected to continue in the face of certain loss. Those who are dependent upon the lumbering industry for their livelihood will be the first to feel the effects of a decreased output in the mills during the last month or two of the year, and a smaller output in the woods next winter. Both of these results appear at present to be far more probable than an improvement in the freight situation. One of the noticeable changes resulting from the freight situation is already evident. A larger number of sailing vessels are engaging in the ocean freight business than in former years and the arrivals of steamers for lumber cargoes are fewer than usual. Those who follow the situation closely ascribe the change to increasing international trade, which has made a demand upon the available freight tonnage of the world, with which it is unable to cope. Whatever the cause may be, the effect is clearly evident and is causing widespread concern among the lumber manufacturers of New Brunswick.

An Unsatisfactory Combination of Conditions

Had this state of affairs been accompanied by a shortage of available stocks of logs, or by a falling off in the keen competition in the lumber markets of Great Britain, the trade at Restigouche points and at the other important exporting points in New Brunswick might have remained normal. But the reverse is the case. Restigouche operators, for instance, have some 108,000,000 feet of logs this year, as the result of last spring's drive. Last year they had about 95,000,000 feet. In 1910, the total was 91,500,000 feet, and in 1909, 81,000,000 feet. The statistics and market reports therefore show increased output of logs, freight rates over fifty per cent, higher than a year ago, and foreign markets characterized by keen competition. The net result is reduced trade and about a dollar a thousand feet less for the lumber manufacturer.

There are one or two features of the trade, however, which are assisting the manufacturers and which appear to bear the seeds of future important developments. Broadly speaking these may be summed up in an increasing tendency on the part of the manufacturers of New Brunswick lumber to look to markets nearer home. In the first place the lumber trade in the Maritime Provinces is much better than it has been for some years. For a time it was at a standstill earlier in the present year, because the new government at Ottawa had not commenced its important outlays upon public works. These are commencing now, and the trade of the Maritime Provinces in general is active. There is not only an increased demand for lumber, shingles and lath, but there is also an improvement in the class of product which the local markets are now consuming.

Much the same thing applies in connection with the trade with points in the Eastern States. In spite of the fact that everyone predicted a poor year's trade on account of the presidential elections, the demand for New Brunswick lumber has improved greatly at New York and Boston and a number of the New Brunswick manufacturers who formerly depended mostly upon the markets of Great Britain are finding an outlet for their product in the United States. Formerly the United States markets took the lower grades mostly, but to-day they are buying large quantities of the better grades. Unfortunately the United States markets are not safe to bank upon, as trade conditions fluctuate there so greatly and so rapidly. Nevertheless, under present conditions, they are furnishing an excellent substitute outlet for stocks which cannot go to the Old Country.

The Importance of Quebec and Ontario Markets

Perhaps the most noticeable and also the most important present feature of the trade is the tendency to look to Quebec and Ontario markets, both of which are now active. The most frequent enquiry which one hears among the mill-owners of New Brunswick to-day, is regarding market conditions in Ontario, and the outlook for establishing therein a steady trade for New Brunswick lumber and shingles. Unquestionably, New Brunswick manufacturers at Restigouche and Miramichi points are studying this feature closely. Several have already laid plans for actively seeking Ontario trade. New Brunswick lumber and shingles have already been sold in Ontario markets for a long time, through local agents. The present temper of the manufacturers, however, is to go far more extensively into these markets, and to send their own representatives out for orders. New Brunswick firms have done very well in the markets as far west as Montreal and they believe now that in a short time they will do nearly as well also in Ontario. One large firm to-day has its chief member travelling in Ontario, going thoroughly into the question. Other firms of equal importance are developing plans along the same lines. They are impressed with the fact that all lumber is bringing good prices in Ontario to-day, and that with their excellent timber resources and favorable operating conditions they ought to be able to place New Brunswick spruce lumber and cedar shingles, especially in Ontario, at prices which will give them a ready sale.

Whenever one speaks of shingles to a New Brunswick manufacturer he is assured that for lasting quality and good manufacturing they cannot be excelled. One hears frequently a complaint that New Brunswick shingles have been misunderstood in Ontario, because of inferior grades being imported by Ontario firms and represented to purchasers as the better grades. One manufacturer indignantly related that he had found clear whites—a sap shingle—represented as one of New Brunswick's choicest grades, and that he had frequently heard retailers report that the trade had soured on New Brunswick cedars and wanted nothing more to do with them. There is room for some persistent educational work along this line in Ontario and the promise of good results is encouraging.

Miramichi Lumber Trade Conditions

Much that has been said of trade conditions at Restigouche points applies with equal force in connection with Miramichi points. One of the largest manufacturers on the Miramichi in discussing the situation said:

"Trade conditions, as far as lumber is concerned, are very unsatisfactory, principally on account of the excessive freight rates. The markets in England are as good as they were last year, but there has not been improvement sufficient to cover the increased cost of shipment, which amounts to from 15s. to 20s. per standard above last year's rates. To-day, the rates asked from Miramichi points are from 55s. to 60s. per standard. Last year they were from 37s. 6d. to 40s. per standard. A rate of 52s. 6d. has been paid for a Bay of Fundy port within the last few days. At the same port last year they would not pay more than 37s. 6d. Those who sell their stocks f.o.b. Miramichi points have this year to accept from $12.50 to $13 per thousand feet for a specification of thirty-five per cent. 9's and up and sixty-five per cent. 7 and 8 x 3, whereas last year the same mills got from $14.50 to $15.25 for the same stock. Up to the present this has not been reducing the volume of trade, because the mills had their stocks of logs and have felt obliged to go ahead with their sawing. There is no profit in the business at these prices, however, for the mill owners, and when this stock is sawn, unless

they can get better prices many of the mill owners will not go back into the woods next winter. Some of them have already practically decided not to do so. The markets in the United States are good but the duty of $1.25 per thousand feet against Canadian lumber is hard to overcome."

Government's Timber Lease Policy Should Be Announced

Speaking of the standing timber situation, the same operator, discussing the government's position, said: "The time has arrived for the New Brunswick Government to define its policy in regard to the timber limits. The present leases to cut timber from Crown lands all expire in 1918. The conservation of the forests, and the continuance of the lumber business in the hands of the present mill owners, whose large vested rights deserve consideration, depend upon the government declaring its policy at an early date. Unless the present owners of leases are made reasonably certain of a continuance of their cutting rights upon terms which are not burdensome, their only course must be to make the most of their present opportunities by cutting every possible stick of timber before 1918, and in this way doing a serious injury to the timber resources of the province.

"At present the stumpage rates are as follows: spruce, pine, cedar and hardwoods $1.25 per thousand feet; hemlock, 40 cents per thousand feet, or 40 cents per cord for hemlock bark; balsam fir 80 cents per thousand feet. A rental of $8 per square mile is also paid annually, which is the highest rental charged by any of the provinces in the Dominion.

"The owners of timber licenses want the government to define the policy under which they are willing to renew the licenses after 1918 and also to fix the stumpage rates for a definite period, as is done in other provinces."

In connection with the views expressed above by a prominent lumberman, it is interesting to note a couple of well-defined rumors on this subject. One of these is to the effect that the government, being anxious to encourage the manufacture of pulp, intends shortly to announce that sawmill operators who also conduct a pulp manufacturing business will be granted renewals of their licenses on satisfactory terms. This would be all well enough but would not be fair to those whose facilities do not permit of pulp manufacturing, and who would be left in the dark until the government made a further announcement of its policy. Another rumor is to the effect that the large holdings of timber leases will be reduced; that every lease will be characterized by a fixed proportion between the standing timber and the capacity of the mill and that the present large holdings in many cases will be reduced by about one-half. The idea of such a policy would be to encourage the smaller manufacturers and bring about a more general distribution of the timber resources of the province. Such a plan would naturally meet with disapproval among the larger companies. These are only rumors, not to be vouched for, but they indicate the trend of opinion and they clearly make it a matter of importance that the government should soon declare itself upon this matter which concerns in a large measure the commercial welfare of the province.

New Brunswick Notes

Not for the past twenty years has there been such a sight on the Miramichi River as has been produced by the jamming of nearly the whole cut of the lumber drive on the southwest branch of the river. The great jam is located at a point a couple of miles above Millerton, where from 60,000,000 to 70,000,000 feet of logs are packed into a space about three-quarters of a mile long. The jam extends from shore to shore and reaches from the bottom of the river to a height in some places of twenty feet above the level of the water. The logs in the jam are valued at $600,000 at least.

The cause of this exceptional jam was a rapid rise in the river caused by three days of prolonged and heavy rain. All the logs in the southwest boom limits and those above it were swept down by the flood. At a point in the lower end of the boom limits a jam quickly commenced to form. The great quantity of water and the exceptional number of logs, caused the jam to form quickly and soon to extend to the bottom of the river. When the water subsided, the logs formed a solid bridge across the river averaging three or four feet above the level of the water. At first it was thought that dynamite would have to be used to move the jam, but it has been found necessary only to use donkey engines and the logs are being worked loose by this means. At latest reports it was expected that a channel would soon be cleared through the jam and that the logs would then commence to move freely.

Part of the jam of 70,000,000 ft. of logs on the Miramichi

The Morrison rossing mill, belonging to the Miramichi Lumber Company which has not been operated for a couple of years will be allowed to remain idle for another year. The policy of the company will be to dispose of the large quantity of rossed pulpwood now on hand before commencing operations at the Morrison mill. At present they can only secure vessels enough to move the output of their saw mill and their other rossing mill at Chatham.

Mr. Arthur H. Campbell, of the Campbell-MacLaurin Lumber Company, Montreal, made a business visit to New Brunswick during the last week in June.

Mr. Wm. Power, M.P., of W. & J. Sharples, Quebec, P.Q., visited New Brunswick points upon business during the last week in June.

Mr. D. H. McLennan, of the McLennan Lumber Company, Limited, Montreal, visited some of the New Brunswick mills during the last week in June.

D. J. Buckley, whose sawmill is located about 1½ miles east of Newcastle, N.B., intends to enlarge his plant for next year's operations, by the addition of a planing mill. He will also install two shingle machines. His present plant includes two rotary saws, double edger and lath machine, and his output is about $50,000 feet per day. He operates also two portable winter mills cutting about one million feet each.

Mr. John T. Rundle Retires from Business

Mr. John T. Rundle, manager of the Miramichi Lumber Company, Chatham, N.B., who had been connected with the company for the past thirty-six years, retired from active business on June 30th, and has been succeeded in the management by Mr. J. W. Brankley.

Mr. Rundle is one of the best known lumbermen in the province of New Brunswick. For the past seven years, since the organization of the Miramichi Lumber Company he has occupied the position of manager and has guided its affairs with much tact and success. He hands the company over to his successor with an excellent organization and a smoothly running plant. The Miramichi Lumber Company purchased the initial part of their plant from the late Wm. Richards and for 16 years Mr. Rundle had been manager of the Richards Company. Previous to this he had had ten years experience with the Guy Bevan Co. of Chatham. His first connection with the lumber industry of the Miramichi was in 1876.

Only four of the 12 provincial water powers put up for auction at Quebec were leased, there being no bidders for the others. Just before the auction three water-powers were withdrawn, thus reducing the original 15 to 12. The conditions were that the water-powers be leased for a period of seventy-five years, on a yearly rental price. The powers leased were as follows: Assemetquagon River, near Metapedia River, Bonaventure County, leased by Mr. James Hall of New Carlisle, in trust, for $51 a year; Riviere Des Aux Nortes, in Hackett township, Champlain County, leased by Mr. Charles Leburn, of Shawinigan, for $53 a year; Chute de la Martine, Metabetchuan River, Lake St. John County, leased by Mr. Hubert Moisan, of Quebec, $38 yearly; Riviere Aux Outardes, Saguenay County, leased by the St. Maurice Lumber and Industrial Company, for $100 per annum.

Members of the Montreal Board of Trade and Chamber of Commerce, with ladies, have had a four days' trip along the north shore of the St. Lawrence, in the "Saguenay," of the R. & O. line. During the trip, the visitors inspected some pulp mills, including the mill of the East Canada Power and Pulp Co., near Murray Bay. They also visited Clarke City, seven miles inland on the Marguerite River, where there is a thriving community. Here is situated a plant for making pulp, with an average of 150 tons per day. There are nearly 1000 miles of timber limits. About 10,000 horse power is developed. Mr. W. Rutherford, Mr. Alex. McLaurin, and Mr. C. G. Spencer were among the Montreal lumbermen who were in the party.

Private Enterprise in Fire Prevention

Modern Methods Adopted by Quebec Province Lumbermen to Protect their Timber from Destruction—Telephone Lines and Watch Towers

By the Editor of the Canada Lumberman.

Look-out Towers for Discovering Fires in the Woods.

Quebec, July 8th: (Special correspondence of the Canada Lumberman). The attention which has been given by the Government of Quebec province to the protection and preservation of timber limits from fire has had an excellent effect upon the owners of standing timber in many parts of the province. Some of the owners of standing timber have in fact, themselves been pioneers in this movement and have co-operated enthusiastically with the province, so that the movement has now made important headway and promises to become of inestimable benefit to the lumbering industry. Prominent among the companies which have taken up this work in earnest are the River Ouelle Pulp and Lumber Company, St Pacome, P.Q., and John Fenderson & Co., Incorporated, Sayabec.

Telephone Protection for Timber Limits

The River Ouelle Pulp and Lumber Company have worked out and put into operation an interesting system of telephone communication, which has enabled them to give their limits excellent protection. The limits of the company include about 192,000 acres of Crown timber lands, which are held under provincial license, and 12,000 acres which are owned outright by the company. The National Transcontinental Railway, which is being constructed by the Dominion Government, traverses the limits from one end to the other and has added greatly to the risk of fire. This was one of the main reasons which induced the company to establish the telephone system. They also found the telephone a great assistance and a means of economy in directing their woods operations from the head office at St. Pacome. Some fifty odd miles of line were first constructed, the line being attached to trees and the telephone stations housed in small buildings, where tools for fire fighting may be stored. The experiment worked so successfully that the company recently added twenty miles of line giving a total of seventy miles now in operation. The lines have been well planned and as they are used for the company's business solely, no interruptions to the service occur. The company is thus in continual communication with its employees in the woods and in case of a fire breaking out, men can be sent in remarkably short time to extinguish it. The chances of a fire ever gaining serious proportions are thus reduced to a minimum.

The last twenty miles of line constructed have been built upon the trolley line system. That is to say, the wires are strung across supporting wires which are fastened to trees a short distance apart. In case of a tree falling, the line falls to the ground without breaking. With the former system of stringing the wires directly from tree to tree, a falling tree would be likely to break the line and destroy the communication. When the National Transcontinental Railway is in operation the River Ouelle Company intend to erect additional mills and will then make further extensions to the telephone service.

Protection by Look-out Tower

Another method for learning of the existence and location of a fire in the woods has been adopted by John Fenderson and Company, Incorporated, Sayabec, P.Q. This company does not require telephone connection to regulate its woods operations, as in the case of the River Ouelle company as it takes only a short time to send men from the head office with instructions to the men in the woods. For fire protection therefore, they have erected on the highest portion of their limits a steel look-out tower, from which a good view is secured of the surrounding country. The location of the tower is about five miles south of Cedar Hall, P.Q. It is practically 2300 feet above sea level and 1800 feet above the level of Lake Matapedia, which is close to the company's mill at Sayabec. The watchman on the tower has a good view of all the surrounding country for a radius of twenty miles. The protection thus obtained covers not only the limits of John Fenderson & Company, Incorporated, but those also of Price Brothers, and part of the limits of the Metes Lumber Company, which adjoin.

The look-out man is in telephone connection with the National Telephone Company which runs through the St. Lawrence Valley from Levis to Campbellton. He is thus enabled, when he discovers a fire, to report immediately to the head office and men can be sent out at once to extinguish it. Very few fires thus secure a dangerous grip. Only once has it been necessary for the company to close the mill and send out all its employees.

The steel tower has a height of 50 feet from the ground so that the look-out man may be well above the tops of the trees. On the top is a platform 12 feet square, furnished with a table and an aldidade, an instrument for finding the location of a fire which has been noticed. The limits of John Fenderson and Company, Incorporated, include ninety square miles of land under license and 37,000 acres of private lands, making in all 94,600 acres which the look-out man protects, in addition to those of Price Brothers and the Metes Lumber Company.

Tool Boxes Distributed in the Woods

To supplement the look-out system, boxes containing tools are put out throughout the limits. There are between 25 and 30 of these boxes in all. The contents of the boxes vary according to the locality. The tools include shovels, pails, axes, grub hoes, mattocks, etc. The boxes are located at places where the greatest danger exists.

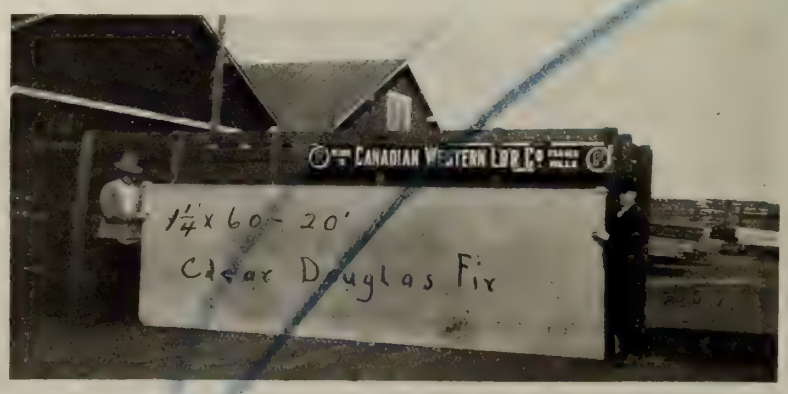
The look-out man spends the whole day on the tower during the dry season. Some years this will mean the whole of the summer, while in other years it will be only for a month or two. He spends much of his time preparing a map of the surrounding country and perfecting the means used for locating a fire. He lives in a small house near the foot of the tower and his principal exercise consists of climbing the tower and going for water for his cooking, washing, etc.

This system of protection has proved most successful and a similar tower will be erected soon by Murray & Gregory back of L'Islet near the boundary line between Quebec and New Brunswick.

The recent formation of the St. Maurice Valley Protective Association is another step in a similar direction to the above, though on a far more extensive scale. The owners of timber in the valley have combined for mutual protection against fire. By having a large area patrolled under a single management they will be able to carry out the work far more effectively and economically than if it were done individually. Altogether the movement in the direction of preventing forest fires in Quebec province is of encouraging proportions and is certain to prove an important factor in the successful development of the lumbering industry.

The illustration at the head of this article is a view of the tower on the limits of John Fenderson and Company, Incorporated.

The board shown above which is 1¼ x 60—20 clear Douglas fir was recently cut by the Canadian Western Lumber Company at their Fraser Mills, B.C., from a fir log 10 ft. in diameter. It is a well



Cut from a B. C. Fir Log 10 Feet in Diameter.

known fact that fir as a general rule is exceptionally clear but a board of this dimension is very seldom heard of. The Editor of the Canada Lumberman will be pleased to receive photographs and descriptions of exceptional sized board and logs.

Canadian Saw Mill Managers

J. A. Mercier, Les Escoumains, Que.

J. A. Mercier, Les Escoumains, Que.

Probably in connection with no other industry more than in the manufacturing of lumber can it be said that its business instincts and preferences are handed down from father to son. If the lumber industry of Canada were studied with a view to discovering the extent to which the truth of this claim could be substantiated, it is safe to say that the results would be astonishing to even those who are already aware of the general fact. Those who have in this manner carried on the traditions of their families in the world of business have in a remarkably large number of cases made good in a way which is also characteristic of the lumber industry. Mr. J. A. Mercier, whose portrait is published herewith, is one of the examples of this feature of the lumber industry. He is the son of Mr. Arthur Mercier, a man widely known and respected in the province of Quebec as a lumberman.

Mr. J. A. Mercier was born in the province of Quebec and after finishing his preliminary education took a course in a commercial college to enable him the better to handle the problems of business life which he was certain to come across as an active lumberman. Then he commenced work in the employ of his father who was at the time engaged in farming operations at Port Dalhousie, Ontario. In the year 1901 Mr. Mercier's father, together with Mr. F. C. Dudley and Mr. C. W. Morton, formed the Saguenay Lumber Company. They bought limits on the Escoumains river and settled in that district, one of the most beautiful spots upon the north shore of the St. Lawrence. In the employ of this company Mr. J. A. Mercier first of all devoted his attention to their store, and he was appointed manager in 1909, replacing his father who then retired. Having secured an excellent training in the work he took charge of the sawmilling operations and became one of the most successful mill managers in the province of Quebec.

Les Escoumains is situated 27 miles from Tadousac and 21 miles from Trois Pistoles where the Intercolonial Railway passes. Although 150 miles from the city of Quebec, Les Escoumains can be reached from that place in 8 hours. The Saguenay Lumber Company own one of the finest tugs on the St. Lawrence river called "Escoumains." During the spring tides, the company are able to load at their wharves, a boat drawing 11 feet of water. Throughout the summer months they operate a schooner known as the "Saguenay," which carries lumber to Quebec and returns with supplies.

The limits owned by the Saguenay Lumber Company amount to 410 square miles and contain a large supply of saw logs and an almost incalculable quantity of pulpwood. It will be readily seen from these particulars that Mr. J. A. Mercier in his capacity of manager is an extremely busy man. Thanks to the excellent training which he has been able to secure from his boyhood days, on account of his father being engaged in the saw-milling industry, Mr. Mercier is thoroughly equipped to carry out the extensive duties connected with an operation of this nature.

Different Methods of Salesmen

Some salesmen are very conscientious in soliciting orders and are careful not to overload their customers, says the American Lumberman. One such was heard to advise a dealer to buy a smaller quantity of a certain item than he intended to buy, as in his case the material was slow of sale, and it would be better to buy oftener than to hold the stock so long in pile with his money tied up in it. The dealer saw the force of this argument and bought in accordance with the salesman's advice. The salesman said that was his custom, and he believed he had made business friends by it. His duty, he said, was to assist his customers in every possible way, and he knew of no reason why a retail lumberman should overload with any particular item any more than he should were he dealing in other lines of merchandise.

At the time yellow pine was feeling its way at the minor northern consuming points it was the advice of a certain salesman to his customers to go slow in buying. In a certain sense the consumer must be educated to its use, and it was unnecessary to invest any large amount before the wood was established. It would take the place of white pine and hemlock, but it would not do it all at once. One car for a trial would answer every purpose, and if that sold readily a larger stock could be quickly obtained. This advice was acted upon, and an unnecessary investment was avoided.

A salesman took the same position in regard to redwood siding. Redwood had not been sold in the market. The siding was pleasing to the eye of the dealer, it was offered to him at a price that was a consideration, all of which did not imply that it would be accepted by the consumer. It was the advice of the salesman, who formerly was in the retail business, to go slow on it; that the actual sale of any material beat any anticipation of the way it might sell, and that it would be better business policy to lay in a half car than a full one until the verdict of the builder had been rendered. This was done, with a result that on the next visit of the salesman he was given an order for a car.

The majority of salesmen, however, are less conservative than this. They consider it their business to sell all the lumber they can, and frequently they solicit in a way that is not entirely pleasing to their customers. A dealer was heard to remark that because of the persistence of a certain salesman he had become absolutely objectionable to him. That salesman, he said, would go out through the yard, note the size of the piles and then argue that he was short of certain items which should be added. In short, he assumed to know more as to what the dealer wanted than did the dealer himself. That salesman seldom receives an order from this dealer, yet he may not know that his insistency is the reason.

A certain dealer said he did not want any salesman to tell him what he wanted, or what he did not want. If the salesman was going to run the business, why, let him buy it and then run it, but until that time he wanted no dictation from him. Nothing, he said, would disgust him more quickly than for a salesman to keep "pegging away" at him, as he expressed it, to buy when he had no occasion to buy. He was always glad to know of anything new there was to be offered, of any special prices which might be made, and knowing this he would be the judge as to whether it was the thing to buy or not.

There is a salesman side to this question. One of them said he had customers who keep no close run of their stocks. He had looked through their yards and discovered shortages which, if not corrected, would have proved embarrassing. He noted an instance in which the bin of 2 x 4—12 was nearly empty, the dealer being of the opinion that a bin of 2 x 4—16 were of the first named dimension. He could recall several instances of a similar nature. He had customers who kept a list on their desks of the items wanted, and if he could not sell to them the material listed he knew he could not sell them anything. These customers know what they have in stock and it would be senseless to suggest any additions to it beyond the shortage list that was made out.

Another salesman said he regarded it as his business to sell anything he could to a dealer provided he could pay for it.

Record Car from the West

The accompanying illustration shows what is probably the largest car load of dressed lumber ever shipped from Canada. It is a car of Douglas fir sheathing, consigned to the Canada Car & Foundry Company, Montreal, and shipped by the Canadian Western Lumber Company, Fraser Mills, B.C. The car which is of the automobile class, owned by the Rock Island Railroad, is an exceptionally large one with doors at each end. The load was made up of 28,060 bundles, six pieces to the bundle, 1 x 4 x 9 Douglas fir sheathing, aggregating

Record Car Load of Lumber from the West

51,480 ft. b.m. The Canadian Western Lumber Company have shipped some large cars recently, but they think that this one is a record for Canada. The Canada Lumberman will be pleased to have mill men forward a description and photograph of any car that exceeds this.

New Brunswick Trade Changing Markets

Markets of Great Britain Disturbed by Competition and High Freights—Increased Shipments to Eastern States—Lumber Producers Association Suggested

By the Editor of the Canada Lumberman

St. John, July 5th: (Special correspondence of the Canada Lumberman). Lumbermen in New Brunswick have various views regarding trade conditions at present but they are all a unit in declaring that the trade with Great Britain has been demoralized by the high freight rates for ocean shipment. In cases where it is possible to ship to United States markets such as Boston and New York, the effect is not so serious, but, there is scarcely a lumber manufacturer in New Brunswick to-day who has not suffered by reason of the increased cost of shipment: even the shipments by rail to the United States are still in an unsatisfactory condition as the railroads cannot furnish sufficient cars. It is undoubtedly the case however, that New Brunswick manufacturers this summer are devoting far more attention to United States markets than formerly. The demand from the Eastern States has increased greatly, a fact which is responsible largely for the independent stand taken so far by manufacturers, in regard to English contracts. It has been most fortunate that the United States market has, in this manner, helped to consume stocks which might otherwise have accumulated and compelled sales to Great Britain at unremunerative prices.

Some Manufacturers Talking of Closing Mills

As to the actual state of trade and the probable developments of the near future, opinions vary greatly. Two well known St. John manufacturers express the opinion that unless freight rates to Great Britain and the United States come down, they will be obliged to stop their mills for lack of piling grounds, and that a further result will be that they will have to hold over some of their logs for next season and will not operate so extensively in the woods next winter. Whether this result is to come about, will depend upon the margin of profit possible, after paying the freight rates. That there is not as yet a unanimous belief that the mills will stop rather than pay the high freights, is evident to those who discuss the situation with different members of the trade. An opinion which is frequently expressed is, that so far as the United States trade is concerned the manufacturers will, in the end, pay the higher freights and move their stocks rather than stop sawing. Just at present however they are not doing so to a great extent and vessels are very scarce as a result. Vessel owners can get the higher rates elsewhere and naturally avoid the ports where shippers are holding out for lower rates. It is stated by some that plenty of vessels would flock to St. John if it once became known that the shippers were willing to pay the increased rates. To-day the freight to New York from St. John is $4 per thousand whereas a year ago it was only $3. To the Old Country the rates have advanced about $2.50 per thousand and the rates from Baltic ports to the United Kingdom, although higher than a year ago have not advanced in anything like the same proportion. Baltic whitewood therefore is getting the greater part of the trade which formerly belonged to Canadian spruce.

Sawing More for United States Trade

The New Brunswick mills have been able in most cases to alter their sawing operations to suit the United States markets, without any difficulty. The chief difference consists in cutting two inch stock instead of three inch. With a bandsaw equipment this involves no alterations. With a gang saw a few changes costing practically nothing, are needed. The eastern United States have always taken a fair quantity of long lumber from New Brunswick. The demand of late however, has turned strongly towards lumber for making boxes, for which the shorter lengths provide good material. Thus the stock which would go to the Old Country under normal conditions is finding a good outlet to-day in the United States. The situation, for the time being, is redeemed to a great extent in this manner. Whether the change will be permanent remains to be seen. Many of the New Brunswick manufacturers have preferred the English markets in the past, considering them more steady. Unquestionably the demand for lumber in the United States suffers from extensive and sudden fluctuations, yet, with conditions continuing as they are in England to-day it will not be unreasonable if the New Brunswick manufacturers turn the larger part of their trade into the United States, feeling that it is better to trade in a fluctuating market, than in one where they are so frequently confronted with labor disturbances, and high freight rates which dislocate trade and render it even more speculative and risky than that with the States. Examples of the risk which accompanies the Old Country trade under present conditions are not hard to find. In a certain case for instance, a prominent firm of New Brunswick exporters, last year refused to accept the prices then offered in England. The freight rates left them so small a margin of profit that they decided to hold a lot of their stock over till the present season for a better price. After the expense of holding this stock they are to-day accepting a price below that which they refused last year. It may be said however, that, to a lesser extent, similar trouble exists in connection with the U. S. trade on account of scarcity of vessels and cars. One firm during the early part of the present year contracted to deliver 500,000 feet of lumber and were only able within the specified time to secure sufficient cars to deliver 100,000 feet. The balance of the order had to be abandoned. In this connection there is a most important difference between conditions in England and in the United States. In the latter country there exists an excellent demand for New Brunswick lumber, shingles, etc., and buyers are ready to pay good prices, the only difficulty being to make dilevery. In England, however, there are several difficulties. The high freights make delivery very costly and the competition of lumber from other countries puts the English importer in a position to put the burden of the freight rates upon the Canadian exporter. There is in fact a wide-spread feeling in New Brunswick that the importers in Great Britain are trying to squeeze them unfairly, hoping that Canadians will meet their terms rather than refuse business.

Organization Suggested to Regulate Output

When the situation, as outlined is considered it becomes a matter of surprise that the large producers and exporters of New Brunswick have done nothing in the direction of banding together to protect their trade. Discussing this subject recently one of the largest manufacturers and exporters of New Brunswick spruce expressed the following views to the editor of the Canada Lumberman:

"The lumbermen of this province should wake up to the fact that the control of the English spruce market is in their hands. If the lumbermen in the Maritime Provinces who are holders or owners of spruce timber could establish some sort of selling or handling company by which the entire cut of the various mills could be controlled, the English market would not be able to dictate to us. We would dictate to it. Instead of this, everyone cuts and slashes, borrows from the banks and begs the Englishman to buy from him. A plan like this, in New Brunswick, would put lumber up two or three dollars a thousand. To-day, when it becomes known that the cut is a very large one here, the Englishmen commence to look for bargains. If each lumber manufacturer in New Brunswick would have common sense enough to allow both his cutting and his selling to be regulated by a handling company in which he would be a stockholder, the improvement would be immediate.

"The only way to bring this about would be to have a few of the men who can afford to do it organize the business. It would multiply the value of our timber resources four fold. Such an organization could provide for protection of timber against fire. It would be in a position to secure necessary important legislation. It would enable us to control the lath market in the Eastern States. The value of our lath in the United States would be increased by from fifty cents to a dollar. It would do away with the competition among manufacturers for cars and vessels. and would strengthen the manufacturers' case in opposing freight advances as the trade of so large an organizaztion would be an important item with the transportation companies.

Some of the Advantages Expected

"The experience gained by such an organization would result in adjusting output and shipments closely to market requirements and would prevent the frequent waste and trade depression caused by over-production. Instead of being cut and sold at a loss, much of our timber would be preserved for a future day when its value would permit of a good profit. The present year has shown the lumbermen that it is possible for some of them to be seriously mistaken in their opinions of future conditions. Some years ago many lumbermen predicted that deals would advance to $20. They went up to $15 and back to $13. They could be sold for $20 under normal business conditions if some such organization were formed as I have mentioned. At least ten of the strongest lumbermen of the province should form the foundation for such an organization. If they could be induced to take the matter up it would mean the salvation of the lumbering industry of the province.

At first glance the above views may seem radical or visionary. That they are not so however, is the firm conviction of the man who expressed them and he is a man who has made a reputation for prudence and business capacity. In order to assist in having this question thoroughly discussed from every point of view, the Canada Lumberman will gladly place its columns at the disposal of its readers, and invites them to contribute their views.

The Making of N.B. Cedar Shingles

Description of Manufacturing Methods Employed in a Modern Mill at Fredericton, N.B.—Grading Rules and Markets

By G. H. Prince

Editor's note: The Province of New Brunswick produces many articles which have made its name celebrated in the markets of Canada and the United States. None of these products is more justly famous than the New Brunswick cedar shingle. The good name of the New Brunswick shingle is to be accounted for in several ways, but the chief are the excellent raw material from which it is manufactured and the great care which has been taken at all times, by those engaged in the industry, to preserve the high standard of excellence in manufacture which helped to make the product so favorably known. In the different provinces of Canada and in the United States shingles are manufactured of many varieties. Each district has peculiarities of its own in its manufacturing methods and there are some characteristics which are common to them all. In New Brunswick the methods adopted are the result of evolution and of close study. These methods have been responsible for a large share of the favor in which the N. B. shingle is held and for this reason an article telling of the actual processes which contribute to the production of the finished article, will be read with interest by shingle manufacturers in all parts of Canada. The following article was prepared by Mr. G. H. Prince of the University of New Brunswick who made a close personal examination of the mill in question and has described its equipment and working in a concise and practical manner.

The mill in question is located on the bank of the St. John river about one mile below Fredericton. When in full operation it cuts two hundred and eight thousand per day and employs sixty to seventy men.

The pond consists of an area of about twenty-five square chains surrounded by booms, the booms being attached to piers arranged around the pond. The rafts are floated into the pond and broken up by cutting the boom-poles. The pondman arranges the logs at the foot of the rollway and attaches a piece of chain some twenty feet long to four logs, two logs on each side of the chain. No dogs are driven into the logs as the chain is attached by a slip knot. The loose end of the chain bears a hook which the pondman hooks into the large endless chain. The latter passes up the rollway into the mill and around a drum and returns under the floor of the deck and rollway. There is also a drum at the lower end of the rollway and one just between the deck and rollway. The main drum is connected with power by means of a shift lever in the hands of the deckman. The deckman takes off the chains, rolls the logs to one side and returns the short chains to the pondman by throwing them down a slide provided for the purpose. The log deck is about twelve feet wide and sufficiently long to allow two ordinary logs to lie end to end. This permits the use of two bolting saws on one side of the log deck. The other side of the deck is devoted to the storing of boom-poles ready to be cut into shingle binders.

Equipment of the Mill

The bolting saws are sixty-eight inches in diameter when new and are used till they reach a diameter of fourty-one inches. They last three years and are worth $105. The logs are rolled from the deck onto the saw table (3 ft. by 12 ft.) which is on rollers so that it may be shoved in against the saw. The top of the table is also provided with rollers so that the log may be shoved forward as each bolt is cut off. Three men operate the bolting machine. One head sawyer who by means of a hooked stick, which he hooks into a ring on an upright attached to the back of the table, holds the log in place while being cut. One rear end man stands at the rear of the table and assists in moving the log and operating the table. One sawyer's assistant who stands at the right of the sawyer and catches the bolts as they are cut and hands them to the barker who holds them against a system of knives which remove the bark. Several men are required to carry the blocks from the barker to the shingle machines where they may be easily secured by the shingle sawyer.

The mill contains sixteen shingle machines of the type made in Fredericton, the saws being seventeen gauge and thirty-six inches in diameter. Each saw is worth $22. They are usually filed three times a day and are used till they reach a diameter of thirty-one inches. One shingle sawyer operates each machine. Each machine is expected to cut thirteen thousand shingles per day. An expert sawyer will finish this quantity early in the afternoon. Back of the machine and in front of the sawyer are arranged five bins into which the sawyer throws the shingles according to the following standards.

Grading of New Brunswick Shingles

EXTRA. A perfect shingle and none less than 3½ inches wide. Shingles 10 inches wide and upwards may have a slight stain between center and point.

Clear. Free from defect 8 inches from butt and none less than 3½ inches wide. Shingles 10 inches and upward may have small round knot 7 inches from butt.

2nd CLEAR. Free from defect 6 inches from butt except a small sound knot no larger than a U.S.A. cent, and not less than 3½ inches wide, also a slight stain to butt.

EXTRA NO. 1. All sap shingles except black and none less than 3 inches wide. No rotten or bad knots for 5 inches from butt. Edges to be free from wane.

NO. 1. All refuse shingles to show sound knots and fairly sound faces.

How the Bundles are Prepared

The shingle packers sit near the bins, on blocks about six inches high and pack their shingles into a box the ends of which are arranged with hinges and springs so that the bunch may be removed when finished. The box has no sides the shingles being kept in line by means of two stakes, one on each side. A bunch of shingles should contain 23 layers on one side and 24 on the other. Each layer should have the equal of five 4-inch shingles. The bunch is fastened together by means of two wooden binders one on each side of the bunch fastened at the ends by tarred rope prepared for the purpose. Each packer is supposed to put up 52 bunches a day, if more are put up more pay is allowed. The packer marks his number on the bunch and a carrier takes it to the store room where the grade is marked on it at once. The carrier also records the packer's number in order to check the number of shingles packed per day per packer.

The wooden binders are cut from the boompoles. The latter are cut into 20-inch lengths by means of a small circular cut-off saw and afterwards split into sticks about 1¼ inch square by a circular rip saw. One man is sufficient to operate this machine and to produce enough binders for the numbers of shingles cut. Grooves are cut in each end of the stick to receive the binding rope and prevent it from sliding off when the bunch is moved. They are made with a knife to which a lever is attached.

Each shingle machine requires ten horsepower to run it. The power is provided by a 250 horse-power double cylinder steam engine. Two boilers are used 6 feet by 16 feet and carrying 85 pounds of steam pressure. The water is pumped direct from the river by a steam pump.

The sawdust and waste material are conveyed by means of two endless chain conveyors, one leading to the furnace of the boilers and the other to a large furnace outside the mill where it is burnt. If necessary the latter chain may be reversed and used to feed the boiler furnaces.

The mill is built in two storeys the lower floor being devoted to the shafting and the sawdust chains. The machinery is all on the second floor.

The market for the shingles is mainly in Boston, U.S.A., the local trade being small except for the poorer quality of shingles. None of No. 1 shingles are shipped away.

The cedar logs are all bought in Maine, U.S.A. A duty of 50c. on each thousand shingles produced is collected on logs coming into New Brunswick. Until lately the United States operator in New Brunswick was allowed to bring his logs in free of duty. The change will probably raise the price of shingles or cause some of these mills to close.

The Riordon Pulp and Paper Company, Limited, Montreal, recently offered to the British public, through Parr's Bank, $750,000 6 per cent. first mortgage debentures at 97 per cent., and an equal amount of 7 per cent. cumulative preference shares at 95 per cent. The total capital of the company is $6,000,000, divided into 15,000 7 per cent. cumulative preference shares of $100 each and 45,000 common shares of $100 each; in addition there are $2,500,000 6 per cent. first mortgage debentures. Of the debentures, $1,000,000 are held in reserve, $750,000 have been sold in Montreal, and $750,000 were offered in Great Britain; of the preference shares $500,000 are held in reserve, $250,000 have been sold in Montreal, and $750,000 were offered for public subscription. The company, it was stated in the prospectus, holds licenses from the Quebec Government to cut timber for 1184 square miles, the standing timber amounting to $2,000,000,000 feet B.M. valued at $2,000,000. The present consumption is 50 million feet per annum. The property of the company is valued at $4,272,954. The profits for the past two years averaged $256,916 per annum, but when certain extensions and improvements now in contemplation are carried out, it is estimated that the profits will amount to $661,916.

Lumber and Shingle Trade of St. John

Conditions of Foreign Markets Causing Important Alterations in the Industry —Shingles in Excellent Demand—Comparison of B. C. and N. B. Shingles

By the Editor of the Canada Lumberman.

St. John, N.B., July 9th; (Special correspondence of the Canada Lumberman): The manufacturers of lumber at St. John, N.B., have had a rather mixed sort of a season during the present year and they are still in considerable doubt as to the outcome of the season's business. There is no question as to what would have been the result, had it not been for the fortunate and unusual fact that the markets for Canadian lumber in the Eastern United States have this year improved in a manner contrary to all precedent during a year which includes a presidential election. If matters continue to the end of the present season as they have been so far, it is safe to say that the manufacturers of St. John will have made little or no profit in the markets of Great Britain and that any success which they have had will have been the result of the improvement in the United States markets.

In a consideration of the lumber trade of the city of St. John, N.B., there are several factors to take into consideration which make the business different from the lumber trade at any other Canadian centre. Getting the logs from the woods to the city of St. John is an expensive process compared with the costs of logging at many other points. The drive is a very long one, amounting in cases to some four hundred miles. When the logs have once reached the mills at St. John, however, the manufacturers have the markets of the world at their doors, being able to ship by water to any foreign country in the world. They are not tied down, as in many other cases, to any particular lines of railway for the shipment of their lumber. They have both rail and water shipment at their service, although practically the whole of their shipments are made by water. Comparatively speaking, they enjoy cheap freight rates, which compensate largely for the additional cost of driving and handling their logs. There is another feature of their operations which is unique and affords a certain advantage. The general run of the men employed in St. John mills are more skilled at their work than the men employed elsewhere in Canada at similar work. The St. John employees in the mills are, in fact, a distinct class. They do not go into the woods in the winter, but are engaged in freight handling at the winter port during the winter months. For this reason they live all the time in St. John and become attached to the St. John mills and familiar with the work in a manner which is scarcely possible for mill workers in other parts of Canada who work in the woods during the winter and frequently find employment during the summer at different mills from those in which they were working the year before.

Peculiarities of the St. John Trade

The sawing operations at St. John are regulated chiefly by the demands of its two principal markets; Great Britain and the United States. The British market requires lumber of an average length of 13½ to 14 feet. The United States markets want their lumber of an average length of about 20 feet. The markets of the United States, which are reached by the St. John mills, are not the points which are easily reached by the inland mills. St. John mills catering to the United States markets sell almost entirely to points along the Atlantic coast and some of this stock is re-shipped to inland points. The trade therefore is entirely distinct from that of the mills of the middle west.

The specifications of the lumber sold from St. John are also entirely different from those of the middle west. St. John manufacturers prefer to saw three-inch stock for the British markets. This involves fewer saws and a greater output per day. They saw boards and 2-inch stock only when necessary. Most of their spruce boards are side boards, the centre of the log going back into thick stock. In Ontario and the middle west lumber is used in a different manner than in the Maritime Provinces. Boxes, for instance, are made more from inferior grades than from anything else, and the lumber for house building is largely of two inch. In the Maritime Provinces house building material is more frequently of three-inch stock. The idea of this is that cheaper grades can be used in three-inch and additional strength given to the buildings.

In Ontario the trade is practically limited to local and United States markets. Shipments therefore are almost entirely by the car lot. In the Maritime trade, shipments by vessel are the rule and they run up as high as five million feet to a parcel. A complete shipment in Ontario can generally be taken care of by a single firm. A shipment of some five million feet, which is frequent enough in the St. John trade, involves a very different method of procedure. If one company had to fill an order of this nature for a single vessel it would be necessary for the firm to congest its yard continually in order to have sufficient stock on hand. It would be practically impossible, moreover, to secure sufficient labor to load such a large order at once. For this reason the services of a middleman or wholesaler are required and a vessel is loaded from stocks at a number of different St. John mills. The currency in use in Ontario transactions, moreover, is all dollars and cents, and the measurements are all in thousand feet. In St. John the sales are made in dollars and cents for the United States trade and in pounds, shillings and pence for the English trade, while measurements are in thousand feet for the United States and in St. Petersburg standards of 1,980 superficial feet for the trade with Great Britain. There are therefore many additional complications in connection with the St. John trade. The manufacturers, of course, have long ago become accustomed to these complications, but nevertheless they are factors which have to be taken into consideration when making a comparison of trade conditions in the different sections of the country.

Difficulties in Securing Standing Timber

Then again, the methods of securing standing timber in connection with the St. John mills are complicated. In New Brunswick the timber lands are held by the government in part, and also by the old New Brunswick Railway Company. In the State of Maine where some of the New Brunswick companies also have timber holdings, the lands are entirely in the hands of private owners and have been subdivided into many small parcels as a result of passing from one generation to another. One single private land owner in the State of Maine, for instance, will often own a third of an eighth of a quarter of a sixteenth of a section. It is readily seen, therefore, that the acquiring of timber in that State is an affair of many complications and it has made it necessary in many cases to employ the services of brokers specially versed in the business.

It will be seen, therefore, that there is in connection with the lumber trade of St. John a great deal of complication which is not met with in other parts of Canada. When to this is added a situation like the present, with freight rates for ocean shipment making new high records daily, their position does not seem enviable to the lumbermen of central and western Canada, whose rates of freight are definitely fixed and need the sanction of the Board of Railway Commissioners before they can be legally altered.

In connection with ocean freight rates from Maritime Province ports it is interesting to note that the chief result of the advance which is now in force has been that a far greater proportion of the output than usual is going to United States points. So great has the shipment to the United States been, in fact, that there is some possibility of a slump in prices occurring in those markets if the heavy shipments continue. Ordinarily the United States markets are fickle and will take only a certain amount of Canadian lumber from the Maritime Provinces. This year they are fortunately in a position to take more than usual and the result is that they have been flooded and there is danger of the thing being overdone. The only relief which appears possible is an improvement in the English market. There are fortunately at present some indications of such an improvement taking place, as St. John exporters believe that some relief is likely in the near future, in the way of a reduction in the freight rates. Sailing vessels for the United States trade, moreover, are very scarce and there will probably be a necessary decrease in the quantity of shipments to these points.

Shingles in a Strong Position

The market for New Brunswick cedar shingles has been strong during the present year, owing to a strong demand in the Maritime Provinces and in the Eastern States. The cut of cedar in the woods last year was restricted as the manufacturers had not done well on shingles for some time. This year, therefore, with a good demand and a shortage of stock, the prices have advanced. All the manufacturers have extensive orders for shingles which they are unable to fill. Extras are selling at $3, whereas a year ago they only brought $2.50. Clears are bringing $2.50 as against $2.25 last year. The price of second clears to-day is $2.25. A year ago it was only $1.90. Extra No. 1's are now bringing $1.25 against $1.10 a year ago.

In discussing the shingle situation a leading manufacturer expressed the opinion that the New Brunswick shingle was a better

one than the B. C. Shingle of a corresponding grade, on account of its extra weight. The New Brunswick cedar, however, does not produce so high a percentage of high grade shingles. When the New Brunswick cedar reaches any size it develops rotten streaks which have to be cut out. In the west shingles are cut out of practically clear stock without any fault.

The grading of the New Brunswick and Quebec shingles are practically the same, being as follows:

Extras—Practically sound and free from any blemish.

Clears—Free of defects for six inches from the butt.

Second clears—Free of defects for four inches from the butt.

Extra No. 1's—Clear for four inches from the butt, but containing knots.

No. 1's—All that cannot be graded with the higher grades.

In addition to the above grades some mills make another grade known as "clear whites." This is a clear shingle containing sap wood. Mills which do not classify the clear whites separately include them in their extra No. 1's.

Probable Course of the Autumn Business

According to the opinion of the manufacturer referred to above there is little likelihood of the various manufacturers at St. John being induced by high freight rates to shut down their mills temporarily during the present year. Most of the mills saw a little pine and when there is any indication of the yards becoming overstocked they turn their attention to the pine, which is sawed slower and which can be held over if necessary, through the winter, as it does not deteriorate with keeping as spruce does. Although there was practically no spring fleet of tramp steamers this year the regular liners have taken a large quantity of stock from the St. John yards. During an ordinary year about eighty per cent. of the output of St. John goes to the markets of Great Britain. Most of the manufacturers foresaw the high rates of freight and did their best to get their deals away to the English markets by the winter liners. Although the freight rates on the winter liners were high, they carried large cargoes of St. John stocks. On the north shore, however, many of the manufacturers thought that it would be wiser to hold their stocks and depend upon a reduction in freight rates during the summer. In this hope they have been disappointed and the result is that stocks have been sold from these points during the present season at prices lower than they would have brought had they been shipped last year.

According to recent advices, stocks of St. John spruce at Liverpool and Manchester are heavier than usual at this time of year. On June 30th, for instance, the stocks this year amounted to 23,250 standards, as compared with 15,830 at the same period in 1911. In the years previous to 1911 the stocks were as follows: 1910, 14,240 standards; 1909, 16,410 standards; 1908, 19,060 standards; 1907, 27,030 standards; 1906, 14,330 standards. The consumption at these ports for the month of June, 1912, was 7,960 standards, and for the month of June, 1911, the consumption was 5,710 standards.

The Output of St. John Mills

When considering the trade of St. John it is interesting to note the capacities of the different mills located at this point. According to the estimate of one of the best posted manufacturers at St. John, the daily capacities of these mills are as follows:

	Lumber	Lath	Shingles	Staves
Randolph & Baker	90,000	62,000	.....	16,000
Charles Miller	45,000	30,000	120,000	12,000
Stetson Cutler & Co. (Indiantown mill	90,000	62,000	25,000	7,000
Stetson Cutler & Co. (Jordan mill)	50,000	30,000	90,000	
John E. Moore & Co.	45,000	30,000	.....	13,000
Murray & Gregory, Limited.	70,000	30,000	45,000	25,000
James R. Warner & Co.	50,000	30,000	.....	.....
Harry Miller	45,000	30,000	.....	6,000
Hilyard Brothers	60,000	40,000	45,000	6,000
F. E. Sayer & Co.	30,000	30,000	.....	6,000
Totals	575,000	374,000	325,000	91,000

In addition to the above products each of the mills which manufacture staves also turns out sufficient pairs of heading to accompany the staves. When considering the output of the St. John mills as compared with those in other parts of Canada it is important to note that they are operated on a nine-hour day. The sawing season lasts from about the first of April till the middle of December, making a season of about two hundred sawing days. Last year the sawing season was about two weeks short on account of a shortage of logs. This year the mills were about two weeks late in commencing operations.

Montreal Reports Active Business

Buying in Every Line Stimulated by Short Supply—Trade with U. S. Shows Considerable Improvement—British Exports About Normal

Montreal, July 10: (Special correspondence of the Canada Lumberman). From every quarter one hears good reports as to the volume of business being done—indeed, the only note of dissatisfaction is that supplies are not equal to the demand. Lumber of practically every kind is scarce, and although no doubt this condition of affairs will be altered by the new cut that is coming on to the market, the complaint of shortage is significant of the amount of business that is passing. Dry stock is almost impossible to obtain. Common grades, particularly of pine, are difficult to secure, and spruce is also in short supply. Shingles, too, are scarce. Naturally, quotations have stiffened and the prospects are that they will remain firm.

Trade in dimension timber continues good, and is likely to remain so.

Business with the United States now shows a considerable improvement, and those doing trade with firms over the border speak hopefully of this branch.

The exports to Great Britain are about normal. Shipments to the other side were affected for a short time by the lighter troubles in London, but these are now, to a large extent, over, and vessels tied up in that port have arrived in Montreal. As far as can be judged, the exports will be about the same as last year. Of course, prices have advanced, owing to higher freight charges and the rise in Canadian values.

Most lumbermen believe that the activity in Montreal lumber will be sustained for several months. Certainly there is every prospect of the building boom being maintained. The building permit figures show that during June the work contemplated was estimated to cost $1,718,505, a decrease of $62,355 as compared with the corresponding period in 1911, but for the first six months of the year the total, $8,065,993, exhibits a gain of $759,857 over the corresponding half of last year.

There are further complaints as to car shortage and delay in unloading at the terminals. Clearly the companies are unable to handle trade as quickly as it grows, and although there are abundant promises of improvement, these have not materialized to any great extent. If this tie up occurs now, what will it be in the fall, when cars will be wanted in the West to move what looks to be the greatest harvest that Canada has ever experienced? There apparently will be very few cars to take care of the lumber business and conditions will be worse than they were last fall.

In the pulp and paper section ground wood has been a little easy, but there are evidences of returning strength on account of the lowering of streams not only in Canada but in the United States.

Chemical pulps are a runaway market, supplies are very limited, and prices are different to quote, as they are advancing every week. The outlook is for higher values.

News print is strong, with practically no stocks at the mills, and heavy withdrawals on contracts. The advent of a new mill of large capacity has not weakened the market or caused any surplus, the product having been provided for before manufacture.

Northern Mills Are Busy

Business in the vicinity of Thessalon, on the Missisauga river, is booming at the present time. Most of the drives are in, although several are being held up owing to the breaking of dams. One dam on the upper part of the White River which gave way a short time ago carried away three dams with it which were below, with the rush of water and logs. The mouth of the Missisauga is a very busy place. A large crew of men employed by Eddy Brothers will sort over 600,000 logs there this season. Drives on the Blind river are coming along nicely. The mills are running full time, some of them night and day, and lumber is being shipped as fast as boats and trains can carry it away. There is a large fleet of boats at the present time loading at the North Channel mills. They will clear for Buffalo as soon as loading operations are completed, with prospects of a large cut this coming winter.

The Western Timber Co., incorporated in Maine, is one of the latest companies formed to operate in British Columbia. The capital is $2,500,000. The officers are: F. W. Browne, Chicago, president; H. D. Cone, Cedar Rapids, Iowa, secretary; Leonard Hills, Peoria, vice-president; H. T. Skillin, Chicago, treasurer; executive Daniel Wells, Detroit; Percy D. Hillis, Victoria, and Frank Y. Locke, St. Paul, Minn. H. D. Cone has been interested in timber on Vancouver Island for several years, as has been Percy Hillis, and it would appear as if the new company were a merger of interests.

The Personal Equation in Retailing

Showing the Business Value of an Intimate Knowledge of Human Nature—Adaptability, and What It Means in Trade Relations—Ancient and Modern Conditions

I heard a man make a remark the other day in talking about the pleasure there was in life for him. He said: "One of the most interesting things to me is there are no two individuals I meet who are alike." Ordinarily I would not have taken notice of it, because it is one of the commonest platitudes that we often hear. But the force of its meaning struck me, when I thought of its application to business life and particularly to that in a country town. As a matter of fact, the average business man in the city comes into direct personal contact with comparatively few of those who trade with him. This is especially true with the lumber dealer, whose chief business is done with the contractors and jobbing carpenters. I discovered this in my own case while in business here. I did business over the telephone with scores of people I never saw, and I wouldn't know them if I met them on the street.

In the country town, however, this is very much different. Farmers, of course, come to the yard and buy what they want and deliver it in their own wagons, and there are few townspeople who delegate others to do their buying for them. They come to the office and want to see the material and learn what it is going to cost. In this way the country lumber dealer meets in person with every one of his customers, and learns in time their peculiar characteristics of manner and their various methods of dealing, and the fact that country people in general have more individuality of thought and action than those who live in the large cities. It gives a peculiar zest to country business life that the city dealer knows but little about, and therefore the personal equation is an important factor in the trade of a country yard.

It is a wonderful faculty, this being able to meet these various individual characters, size them up, and influence them to harmonize with one's own interests. This faculty has a commercial value and a large one, too, for the man in business, and it is not infrequently that it enters into his basis of credit with those who sell him his stock. It takes the place of capital in many cases. I have an instance in mind of a certain merchant who has been running a general store in the same town for over twenty years, and all this time there has been a perennial prophecy that he couldn't last in business much longer. He has been close to the "jumping off place" a number of times, but his wonderful faculty of handling people and influencing them has enabled him to avoid going on the rocks of bankruptcy.

A Valuable Possession

It is this faculty in men that line yard owners are looking for in those they want for managers. They want men who not only are competent to manage a yard, but also who know how to manage the individual members of a community and the community as a whole as well. A country yard is a great school for the present-day young man. It always has been, but to-day there are new elements in a country yard business that did not exist when I went into it. The general level of intelligence among the country people in general is considerably higher than it was thirty years ago, and for this reason it requires a different class of business men to deal with it. It is not enough for a dealer to be on the same level in this respect. He should and must be a combination of the teacher and the master in his business relations with the trade. There is not an individual in the community he should not make a study of. He should know his personal connections with other men, his traits of character and temperament and particularly his "blind side." By this I mean his most approachable side and his susceptibility to be influenced by the one "working" on him.

There is one feature about the mail order business that has always seemed little less than marvellous to me. The idea of one man at his desk in a large city concocting schemes to get the trade of millions of people he never saw and knowing only of their existence by their names on his list, and still having the power of influencing them to send their money to him—a perfect stranger—is certainly a study in the power of human mind and human credulity. To counteract this and diminish its effects is the great problem of the country merchant to-day. It is not for him a question to be studied as a whole. On the contrary, he must realize that it is largely a personal matter and personal relations with the individual members of his trade family, for, in a sense, they are his family. They are dependent on him, and he on them, and both should have a clearer understanding of this interdependent relation than is the case now. A community is but an aggregation of separate families. Each individual in a community represents so much of what we term trade. This is greater or less, according to the respective means and purchasing disposition. To secure this is the province of the local business man. To accomplish this he must be able to exert a stronger influence than any one lese. Here is where the personal equation should show greater strength than the influence of a distant stranger.

"Getting Next" to Your Customer

The slang phrase "getting next to a man" has an expressive meaning to it in this connection and implies the paramount influence which one has over another. It further implies the ability to understand him, his wants and his inclinations and temperament. But, for the purposes of business to understand all these is not wholly and always sufficient.

There is another important factor that enters into the question of securing an individual's trade and that is self-interest. Therefore he must be shown and convinced that his interests lie in giving his trade to the home merchant.

In business relations, self-interest is generally stronger than friendship, gratitude or any other obligation, and of late years the increasing prosperity of the farmer has caused the country merchant to give it his particular notice. There was a time when he counted on past favors to retain the farmer's trade, but those have been sponged off from the farmer's memory by the consciousness of his present financial independence, and this has led him into the false notion that the merchant or middleman is a burden which should be eliminated.

Self-interest is one of the fundamental laws of human nature, and is a factor that every business man should have constantly in mind when considering his trade relations with the individual when the latter has his own freedom of action, as the average farmer, for instance, has at the present time. In the early pioneer days the feeling of self-interest was as strong in the farmer as it is now in the days of his prosperity, but it was subject to the control of conditions that produced a forced obligation and dependence on the local business man. Being free now from these conditions the merchant no longer has the hold on him that he once had, and largely for this reason he is confronted with the difficult question of making the farmer understand and realize that it is for his self-interest to co-operate with the merchant in preserving the interests of the town as a whole. Furthermore, and primarily, he must convince the farmer that he can do as well in trading with him as he can with the stranger in the distant city. But convincing him is one thing; teaching by doing is another, and this comes down to the last analysis—the merchant himself. There is a new farmer now and there must be a new class of merchants to correspond.

Conditions Have Changed

The old conditions that affected the one and influenced the other have passed away, and consequently the changes that have put the farmer on a higher level of independence must necessarily evolve a better class of merchants to meet the new conditions that the change has brought about. Few of the older class of merchants are willing to adjust and adapt themselves to the new conditions and therefore it is the younger men in business who are called on to meet and deal with the younger farmer, who is responding to the influence of the scientific methods of the new in merchandising. He has got to be a better business man than his father, or he will lose out in the contest with the younger farmer, just as the latter will lag behind if he follows the old methods of carrying on the intensive merchandising and there is no escaping this fact that is becoming more widely developed every day.

The younger generation of farmers are being educated as business men to conduct their farming operations on a business basis. So likewise must the merchant study his goods, his methods, the scientific principles of salesmanship, and above all the nature and characteristics of the individuals in his community. The scientific farmer studies first of all the properties of his soil, gets acquainted with its essential qualities and from this knowledge he adapts the seeding and cultivation of his crops. So in a corresponding manner should the present-day merchant regard the community as his farm and develop its greatest yield of trade possibilities.

The Old Rule Must Be Qualified

The old-time phrase, "Treat every one alike" that was commonly used in business advertising, has a "catchy" sound and meaning, and takes well with the average person who is unacquainted with the inside of business transactions in general, but practically, it is mean-

ingless in the actualities of dealing with individuals. Of course, this don't apply, however, to the general rules of courtesy and respect, which are among the social amenities that endure from one to another, and the fair treatment accorded to all customers alike. But when it comes to the soliciting of business, the selling of bills, extending credits and the collection of accounts, and all those things that touch directly the self-interest of the individual, the treatment has to vary according to the various differences, in the character and temperament of individuals. We realize this more as we become better acquainted with our trade. I have managed yards in a number of towns, and when I just began in any one of them it was natural that I should treat everybody alike in a general way. As I got better acquainted with those I came into contact with in business dealings, and found out more of their peculiarities, I had to adjust my treatment of them accordingly and the longer I stayed there the more often I had to do this.

An extended period of years of doing business in a place gives to a business man a deeper knowledge of each individual character with whom he has a business contact. He knows how to handle every customer that comes into his yard, and his ability to do this without the customer knowing that he is being "handled," marks his success in holding the trade of his yard. There is a certain pleasure and sense of power in the exercise of this knowledge and ability that every business man of long experience is conscious of. It is one of the fascinations of the business game. How often it is, that in dealing with certain types of customers is like sitting down and playing a game of skill with them. The better you know their nature and characteristics, the greater are your chances of securing what you are playing for.

I have often remarked in these columns, that you never really know a man until you have had business relations with him. If you have not been very long in a town there are many times when, in dealing with a certain individual, you will make a mental note of the fact that you will know better how to deal with him next time, and after several experiences with him you will know just how to take him when he comes for his purchase.

There is a difference in the trade characteristics of nationalities also. While every community is more or less of a mixed character in this respect, there are some where a particular one most predominates. Take a manager who has been running a yard for some time in a community composed largely of American-born people and transfer him to one where the majority are foreign born, Swedes, Bohemians, or any other nationality speaking a foreign language, and besides the routine work of the yard, he has a bigger job on his hands to familiarize himself with the habits of thought, peculiarities and ways of doing of the human units of his trade. He has got to learn to look at business matters from their point of view and adjust his own ways to theirs.

A Liberal Education

It is a liberal education to come into business contact with the "Tom, Dick and Harry's" of the various nationalities in this country. And I count myself fortunate in having had more than the average experience in this respect. I think though, the most interesting of all my experiences in this line was with the colored people. My seven years' residence in the south made me acquainted with the peculiar attributes of this race of people. I early discovered that they had to be dealt with in a sense as children. 'Tis true, they are much more developed as a people now than they were then, a few years after the war. But the average Negro still retains more or less of the credulity and irresponsibility of a race in the earlier stages of its development.

An old philosopher has handed down this nugget of advice, "The proper study of mankind is man," and applying it to the following of a business life, it means that to study your business, you must make a separate study of the individuals you trade with. It is not enough to be able to call them all by their first names, or know what political party or religious sect they affiliate with, nor even their financial ability to pay their debts. These are all important and essential, but what you need most is to be able to know the leading strings of their characters and the responsive parts of their natures. But, in order to be able to control others, you must be able to have perfect control over yourself. And above all, never lose control of your temper, at least in the presence of other people. A man can lose more in a minute than he can gain in a year by letting his temper get the better of him in the presence of another of a high strung temperament. I know it is a great strain on one sometimes not to feel at liberty to give expression to what he feels, and care must be taken to keep it not only out of the expressed words, but from the tone of the voice, the look of the eye, and the action of the body as well. To be able to govern one's self is one of the greatest assets a young man can have.—C. H. Ketridge, in the Mississippi Valley Lumberman.

Salesmanship—What it Involves

At a recent meeting of the National Association of Lumber & Sash & Door Salesmen an address was delivered by I. H. Fetty upon "Salesmanship." Mr. Fetty's remarks were as follows:

The question of the proper marketing of lumber, or any other commodity, I believe, is one of the most important questions connected with any producing industry . . . . Lumber probably is one of the poorest marketed commodities brought before the public to-day, especially from a manufacturer's standpoint. This condition exists solely for the reason that the manufacturer has not been able to arrive at a uniform cost of production, including the cost of raw material. Were the manufacturers to arrive at a legitimate comparative cost of producing lumber they would be relieved of a great many worries connected with the proper marketing of their output, for the reason that it would enable them to know exactly what their finished product cost f.o.b. cars, based upon present value of stumpage; then they could say to their salesmen: "Our lumber cost us so much f.o.b. cars, and it is necessary for us to have a legitimate profit over and above this cost." However, under the present mode of manufacturing lumber there is no basis of cost established. Therefore, one manufacturer will operate his business based upon a certain cost, and another manufacturer according to his views, and there will possibly be a variation of from $1 to $2 a thousand as to what each manufacturer figures his stock has cost him f.o.b. at the mill. This naturally brings about a chaotic condition of the market and results more or less in the travelling salesman advising the manufacturer what he is able to sell his lumber for, rather than the manufacturer being able to say what his lumber is costing and what it is worth. . . . The salesman should understand fully the requirements of his territory and not mislead his customer in any way by misrepresenting true conditions at the mills as to time of shipments, conditions of lumber, etc. In other words, stick to your stock sheets and do not knowingly oversell the mill on anything which it can not furnish immediately, for the reason that when you are crowding your shipping department to get orders filled it naturally results in your shipping lumber before it is in proper condition. This means that it weighs heavier and costs your company extra money in the way of freight, your customer is dissatisfied, and you will find that instead of enjoying his full confidence as you have in the past, you are now placed in competition with a class of manufacturers or jobbers who do not handle their own lumber, and you are compelled to sell your lumber for less money than you should secure for it, owing to the fact that you have misrepresented your company to your customer.

Do not overlook the fact that you many times make your company money by refusing to accept an order. In fact, a good salesman will refuse to book an undesirable order with as much grace as he would book a satisfactory one, and retain the good will and respect of the buyer by showing him that he knew his business and knew when to meet conditions. A thoroughly posted lumber salesman should know what his lumber is worth and quote his price with confidence, and not permit the buyer to dictate to him what he should sell his lumber for. In other words, he is selling lumber for the company by whom he is employed, and should not permit the prices quoted by other concerns to influence him in placing a market value upon his company's product, because there are many conditions surrounding the offer made by his competitor, that while his price may be lower, time of delivery, quality of stock, and general business methods may be such that he would not be considered competition. The salesman should keep away from the idea of cutting his price in order to secure business, because it is not the "quantity-getter" who is the money-maker for his company, but the salesman who uses his good judgment and sells the kind of stock that his company wants to sell and gets the price for it.

Salesman Should Have Full Authority

Another feature which I think is poor busines policy is to take an order subject to confirmation by the general office. This practice, as a rule, places the salesman in what you might term a secondary position with his customer, indicating to him that he is not confident what his firm can do in the way of shipments, or fully posted as to what price may govern. I think a salesman should be thoroughly posted on these conditions, and when an order is taken it should be bona fide, and it should be thoroughly understood in the general office that shipment will be made accordingly.

A salesman should always sell his own lumber upon its merits and not attempt to sell it by trying to depreciate the value of what his competitor has to offer. In other words, be content with knowing all about your own business, and keep in mind the Golden Rule "Live and let live."

Now, getting back to the manufacturing end of the business. I have always believed that if lumber was of sufficient value to spend large sums of money in its preparation for the market, it was certainly worth due consideration in placing it upon the market in proper shape. Therefore, every manufacturer who is able to produce his lumber in

a first-class marketable condition should be represented direct to the trade by his own salaried salesmen who are thorough lumbermen. I believe such manufacturer will reap much greater benefits than disposing of his output in a haphazard way through other channels having no interest in the net profit in the business.

It is regrettable that an industry of the magnitude of the lumber business, and where conservation of raw material is of such vital importance to the future welfare of the community, that the manufacturers can not commune to the extent of arriving at a proper cost basis of the finished product and thereby be in a position to indicate to their sales offices what their lumber is worth and what it should be sold for. This would mean a legitimate profit for the manufacturer and a steady and stable market for the consumer, which would be a satisfactory condition for all.

Advertising to the Consumer and Retailer

Leonard Bronson, manager of the National Lumber Manufacturers' Association, who has been keenly interested for some time past in the great question of the increasing use of substitutes for lumber in numerous channels of consumption, recently issued to the press the following communication on the subject, which is of interest to the trade at large.

The advertising by which substitutes for lumber have been pushed out of and beyond their proper place has had its effect not only on consumers, but on some of the elements in the lumber business itself. It has been greatly changing the character of the retail lumber business until in many cases the retail lumberman can hardly be called such, but rather is merely a retailer of building materials.

So far as these changes have been in the line of progress, so far as these substitutes for lumber are better than the material they displace for given uses, there is no special reason to complain, although sentimentally the retail dealer who calls himself a lumberman may well regret the old days when he did not have to bother so much with cement, lime, brick or various kinds of roofing material. The trouble is that many of the changes are not truly progressive and are unnecessary.

The retail lumber business has changed, chiefly, of course, because of changes in the demands of the community; but these changes have come about very largely through advertising of materials which can be substituted for lumber. The house-builder is by advertising impressed with the idea that he should build his house of cement or that his porch should be of cement or brick or that instead of shingles he should use some kind of roofing paper, considering the fact that slate or tile is too expensive for him. The farmer is led to experiment with all sorts of substitutes for fence posts, for silos, for floors in stables and granaries, and the retail lumberman who wants to hold the trade in building materials must, or feels that he must, cater to the demand.

In most cases the retailer makes the change in his business and stock on hand somewhat against his will; but even he is often impressed by the advertising which influenced his customers, and often advocates the use of the substitutes even where good judgment would suggest sticking to the old materials. So he joins with the trade foes of wood.

Some peculiar facts have developed in connection with the handling of some of the substitutes by retail lumbermen. For a long time the retailers have been fighting the mail order houses, yet in straight lumber commodities the competition with the mail order house was not commonly very serious. Occasionally the local lumberman could take care of this competition, for it was in his particular line, and he was well prepared to meet it; but with a good many of the substitutes he is not at such an advantage in experience and intrenched position. Consequently the lumberman who has allowed the consumptive demand to change from wood to something else has found, must to his disquiet, that he has to meet in these other lines a much more acute and dangerous competition from the outside than he ever had to meet in wood.

For example: a retail dealer finds that his customers are demanding certain brands of prepared roofing in place of shingles to be used in places where he knows that shingles would be decidedly better. But there may be a little special profit in them and so he readily yields to the new demand, puts in his stock of these things, some of which are cheap and nasty and may even advocate their use, thinking perhaps that in two or three years he will have the sale of another lot of this stuff to replace that which he is selling to-day. But he soon finds that it is just this sort of material which the mail order houses are especially fitted to handle and for which they have special advantages. They can buy by the train load where he buys by the car load or less. It requires no special skill or experience to sell it. There is no chance for the exercise of the lumberman's ability to suit the grade to the use, and soon he finds that he has lost his shingle business and has nothing to replace it except at the cost of constant and strenuous competition with the catalog houses.

Gradually the retail lumbermen are waking up to the fact that the substitutes are injuring their business; that wood in its legitimate place is one of the greatest and best of natural building materials and that, except for the substitutes which are demanded by genuine development, which mark a progress toward better building and better homes and better construction generally, he would do better to foster the use and sale of wood. But even yet there are many lumbermen who have yielded to the blandishments of the substitute makers and sellers—yielded unnecessarily and do not yet realize what they have lost and are going to lose.

The general advertising campaign of the National Lumber Manufacturers' Association in behalf of wood must therefore be directed to the retailers as well as to the consumers. Primarily to the latter, for after all a merchant has to sell what his customers want, but the legitimate and wise retailer has not a little to do in determining the wants of his customers. He can from his standpoint of greater experience, by his knowledge of materials and the uses to which they are fitted, give sound advice to his customers which in many cases will be heeded and in all cases will make an impression.

The wood advertising campaign, therefore, will seek to instruct and direct the taste and common sense of the consumer in behalf of wood, but should also reach the retailers with the information they need to develop their business along the lines of permanency and profit.

Advertising to reach the people to whom it is directed must run in the proper channels. Therefore, the ordinary consumer must be reached through the publications to which he subscribes, and especially successful in reaching the consumer is the advertising in weekly and monthly journals which are taken and read by the great mass of the people—the publications which enter the family and are read, reread and studied from the first page to the last. Such are the popular weeklies, a number of the popular monthly magazines, the farmers' papers and to a certain extent those which most generally reach the women of the land. In special classes are the architects' and carpenters' papers and the journals of lines of manufacture for which wood is an important raw material. The mediums which reach the ordinary citizen all reach the retail lumberman as well, but they do not reach him with the kind of business appeal which is needed to assist him in his own campaign for a more profitable and stable business. The only publications which reach the retail lumberman in this way are the lumber trade papers, and so in a comprehensive campaign designed to reach both the consumer and the ultimate handler of lumber commodities, both the general and the special classes of publications must be used. And the retailer himself must advertise if he would develop his business to its largest volume and keep it in the lines of substantial and enduring profit. This he will do through the local paper, and in this work he should have the cordial assistance of lumber manufacturers and wholesalers and of the lumber trade press itself.

The money that will be expended in the general advertising to consumers in promotion of a greater use of wood will not be diverted from other lines of advertising. It is money especially raised to meet a special and comparatively new exigency. The old needs for advertising remain, and they will be revivified and enlarged by the new developments. The fact is that lumbermen as a class have never advertised extensively enough, nor have they usually advertised wisely. There are many lumber trade journals well supported, and yet the entire advertising of the lumber industry, one of the greatest in this country, has been insignificant compared with that of many other lines of less importance and minor magnitude which by the power of advertising threaten the welfare of the entire lumber fraternity. The new campaign of advertising on behalf of wood will result in better advertising, more effective advertising and, therefore better results from the money expended in this way by all classes of lumbermen.

Messrs. J. M. Clifford & Co., of Detroit, Mich., one of America's foremost hardwood firms, whose advertisement appears elsewhere, are in a position at the present time to make prompt shipments, as they always have cars on the track to take care of the rush orders. This firm carries an exceptionally large stock of hardwoods, 90 per cent. of their supply being obtained direct from hardwood mills in Kentucky, owned by them. They claim to have on hand at the present time, absolutely the largest stock of hardwood lumber ever carried by any firm in the state of Michigan.

A Weak Spot in Cost System

There is a weak spot that clings to factory cost systems so closely that it is often overlooked; and, hard as it is to see and weigh up, it is harder yet to get rid of, says the Wood-Worker. That weak spot comes from the knowledge or consciousness that time is being kept and that a test is being made.

This is a matter that has been touched on in these columns more or less in certain of its phases. It was taken specific note of at a recent gathering of box manufacturers, especially in a discussion led by Mr. Goodwillie, a prominent and well-known box manufacturer, who told of some test runs and then pointed out the misleading weaknesses of these tests.

"The first weakness is," said Mr. Goodwillie, "that the test is made under the best of circumstances, with everything working toward the test. Perhaps the workmen do not know anything about the test, but the superintendent does, and generally he arranges things so that the test goes right along and everything is done in the very best manner."

This is the whole thing in a nutshell. If there are tests or time runs being made for a cost basis, they will prove misleading unless one takes into consideration this weakness and makes a reasonable allowance therefor. And it makes no difference whether that test is for labor cost alone, for lumber waste, for machine capacity, or what—that weak spot clings round it just the same.

There is a reply to this argument, the taking of the position that to eliminate this weakness one should have every man at work keep a record all the time and account for all his time every day. Then the time lost between jobs, "whetting," etc., is accounted for and the result is positive.

But that merely changes the form of the weakness. The aim of all this cost-accounting business is not merely to find out what it is costing to run your factory and do certain work, but also includes as a prime factor the finding of opportunities to increase efficiency and reduce cost wherever practical.

Then the men keeping records of all the work they do during the day are dividing both their time and their attention, and giving part of it over to this record-keeping. This of itself is non-productive, so the time used here is taken from the productive work, and it adds just that much to the cost of production.

To specialize and reach the highest point of efficiency a man at work at either machine or bench should concentrate his thought and energy on the work he is doing, and the fewer things that come in to interrupt the better. Cost-keeping is one thing and machine work is another, and it is hard to weld the two together without producing a weak spot—which may not be so bad if we see and recognize that weak spot, but if we overlook it we are likely to err in our calculations.

The Need of Good Filing Room Equipment

What gives a man more pleasure than to visit a mill where everything is humming a merry tune with the work coming out in fine style. Visit the first up-to-date mill you can find, writes J. E. White, in Berlin Quality. Take notice of things in general. See anything unusual? What you see is a well laid out mill plant equipped with latest machines.

Notice how everything is in its place. The machines are well kept and look as if they had a daily cleaning and the floor looks like it had come in contact with a broom quite often. Overhead you will find a sprinkling system of the best type, as no manufacturer would think of building a good plant and installing the latest machinery with no means of fire protection.

How about the efficiency in this plant? Compare it with a less modern equipped plant. You have heard the remark: "Why that man can build a house with a saw and a hammer." What's the efficiency of this man using a saw and hammer compared with a carpenter using a good kit of tools and up-to-date methods? What's the difference in the quality of work being done by the man with a saw and hammer and by the man using first class tools? Considerable difference, Isn't there?

Is your mill equipped with the same degree of efficiency as the man with a saw and hammer? If it is, it costs you 100 per cent. more to turn out a lower grade of stock than this up-to-date mill in twice the length of time needed there.

In using fast feed machines you can decrease the cost of manufacturing, raise the grade of your stock and get the profit that belongs to you.

How about your saws? Are they standing up and doing first class work; if not, what's the use of running poorly fitted saws on a good band mill and lowering the efficiency of that machine?

Is your filer a competent man; if he is, what's the trouble? Nothing to work with. How can you expect him to fit saws without a set of proper tools. The filing room is the most vital part of a mill plant. One man claims it is the heart of the saw mill, not only of a saw mill, but of any woodworking plant where a filer is employed.

It must be well equipped and a good mechanic in charge to fit your saws. Otherwise poor results will be obtained. It's a hard matter to figure as to the number of tools needed to fit your saws, but if only one band mill is used it will not require large expenditure of money for tools. In fitting up a filing room the following outlay must be used: a grinder, tension rolls, leveling slab, a swage and swage shaper, or your resawing will always be a source of trouble.

Sending your saws out to be fitted is costly and is lots of bother. The money spent in this manner would soon pay for a filing room. You may not have enough work for a regular filer in a small plant, but it will pay you to keep one as he could look after the belts, run the resaw, etc.

A good many small plants are doing this successfully, but in a large plant where one or more band mills are used, a filer to do his work properly will have no time for other work. It is the practice of some plants to keep a filer busy on work not belonging to the filing room, causing him to neglect his saws and reducing the capacity of the band mills. This practice is applied to cut down expenses.

Mr. Manufacturer, the profits of your band mill lie in the hands of your filer, and when your filer has more work than he can successfully see to, you are losing a part of your profits.

I had the occasion to visit a mill plant sometime ago in which is a single band using 12-in. saws of 14 gauge, a 12-in. shot gun feed, a gang edger, steam nigger, a well equipped filing room, and in fact it is a modern mill throughout and a little faster than the average mill.

This mill was built to cut 40,000, it has cut 47,000. At the present time this mill is cutting 24,000 feet of lumber a day on the average. Enough money was spent to build a 40,000 capacity mill, why not cut 40,000?

It cost the same to run this mill whether it cut 40,000 or 24,000 feet of lumber but the Superintendent of this mill couldn't see it that way so he decided to cut expenses. A filer in a mill of this size isn't overworked so the Superintendent discharged the millwright and now the filer is holding two jobs for the same wages. Not very much of a saving in expenses compared to the profits they are losing by lowering the amount of lumber cut daily.

Ever step into a filing room in which the filer didn't have time to talk to you? Something wrong there. When a filer is taking things easy you can guess that everything is running O.K. and the mill is cutting up to its capacity.

There is another way to cut expenses and that is by installing up to the minute methods of manufacture. Then you can reduce your working force, increase the output of your plant, improve the efficiency of your men, and get the difference in profits between good and poorly manufactured stocks.

The loss here is at once evident, and when it could so readily be done away with, the installation of an Equalizer looks to me like an investment that would pay in every case.

In the case of the shook makers, the Equalizer is indeed an investment. Old style Cut-Offs are not accurate enough to make a perfect box. The result has been in many cases, especially in the past two or three years, that people who must have accurately made boxes have been driven to use boxes of wood substitutes. These are always accurately put together.

The large capacity of hopper fed equalizers adapt them for use in the largest plants and gives them an elasticity of production that provided for future increase in business. Only last month this paper printed a letter from a user of the Berlin Equalizer in which they stated that their machine took care of an increase of one hundred per cent. in business. This firm had standardized their product to the point where large capacity machines were a necessity and I dare say could not afford to be without this machine.

The hopper feed on this equalizer reduces the number of motions of its operator to the point where even the "scientific management" men could find little fault with it. Operators simply pile armfuls of stock in the hopper and the machine "does the rest."

If managers and superintendents would walk about their plants with "seeing eyes," I reckon that more Hopper feed Equalizers would be working than are at present.

"Steam Machinery," a monthly magazine of men, machinery and methods, intended especially for the lumberman, the contractor, the railroad-builder and the excavator, will commence publication before the end of this year. Accepted articles will be paid for immediately after publication, not at a word rate, but at a rate determined by their interest, value and originality. The magazine will be edited for the Clyde Iron Works of Duluth, Minnesota, by Charles H. Mackintosh, to whom all articles should be submitted.

Mr. J. W. Brankley, who succeedes Mr. Rundle, has been associated with the International Paper Co. of New York for a number of years and brings to the management of the Miramichi Lumber Company a ripe experience in the lumber, pulp and paper businesses.

Problems of Factory Electrification

Adaptability and Economy the Most Important Considerations—Determination of Power Needs—The Grouping of the Machines—Comfort and Convenience of Motor Control

By W. B. Wreaks

Correct solution of the power problem is of the utmost importance to all manufacturers. Consideration should be given the question from several points of view, and a system selected that will meet not only the immediate requirements economically but also permit suitable further expansion without undue expense.

Expert is Essential

There are so many factors to be considered, weighed and averaged to obtain the best net results, that the average foreman, superintendent or manager of a factory, who may be fully up-to-date in the line of work for which he is employed, can no more keep properly informed on this specialty and be qualified to assume charge of such work than a layman can properly prepare himself to argue an intricate legal case or do the work of a physician or surgeon.

The two important features to be borne in mind in adopting a system of electric drive are, in the order of their importance, adaptability and economy. Too often the first, and most important, feature is overlooked in an effort to keep down the initial investment. Yet this is the consideration that requires expert knowledge and practical experience to determine, for each particular industry, the arrangement and equipment best adapted to the requirements of manufacture.

The items represented by interest on investment, as well as the cost of maintenance, must of course be added to the cost of producing power to determine the economy of the plant, but it is often false economy to permit this feature to outweigh the proper method of drive, the right application of motors, and the correct selection of type and size of motors to obtain the highest efficiency of production, individually and collectively, from the machines to be driven.

It is the object of the manufacturer to make his product as well as it can be made and then to effect all possible economies in method, system and operation of plant in order to obtain, under these conditions, the highest net profit.

The ideal installation, from the point of view of convenience and flexibility, is the individual driving of machines by their own motors, each motor adapted especially to the requirements of its machine. This feature can be carried too far, however, resulting in an unwarranted expense for the results accomplished.

Determining the Drive

The work of the industrial engineer is to determine how far to adopt the individual drive method and what machines can be driven in groups and still obtain a method of drive that will produce approximately the desired results. It is thus of importance—first, that the manufacturing conditions and work to be performed be investigated and second, that systematic and intelligent analysis of power requirements be made by some one with an expert knowledge of the characteristics of the individual tools and machines, and how they should be operated, before deciding on the system of motor drive to be installed.

In considering the feature of adaptability proper consideration should be given to the following items:

The proper grouping of machines to give the best sequence of operations in the different stages of work for the particular articles to be manufactured.

The manner in which each tool or machine must be driven to produce the best work economically, which determines the required speed adjustment and control; the advisability or necessity of independent or individual drive, and the proper torque and speed characteristics of the motor.

The position in which tools or machines should be placed to secure good light and convenience of operation and control, so as to obtain the highest efficiency from each operator, this often determining the question of individual drive versus belt drive from line shaft.

Power Transmission

The advantage or necessity of rigid transmission of power to the machine, determined by the importance or necessity of uniformity of speed, often making it imperative to drive by individual motor so as to eliminate speed fluctuations, which are impossible to prevent in line shaft drive, with its varying bearing friction and belt slippage, and surging under changes in load.

The arrangement of plant, both as to location of machines and selection and application of motors, so as to most readily provide for extensions required by enlargement of the manufacturing plant, increase in facilities of operation or rearrangement of machines to meet changed conditions or methods of manufacture, this often having an important bearing on the method of drive.

Having determined upon the most suitable method of electric drive, and the machines that should be driven in groups and those that should be driven by individual motors, it is then necessary to make a careful study of power conditions, so as to select the proper power equipment and the proper motors to give the highest efficiency of operation.

An important factor to be considered is the advisability of purchasing current from a central station, if such current is available and suitable; or the installation of an independent power plant in the factory, and, in the latter case, determination of the size, type and characteristics of generator and of prime mover most suitable to meet the motor requirements.

In general it is safe to say that the purchase of power should be given serious consideration, even though it may appear that the power rates quoted would make the cost of power slightly more than the cost to produce it with an independent power plant.

Providing the Power

Providing the local power company is equipped with modern and suitable apparatus and a progressive management, offers satisfactory assurance of the continuous delivery of current at a reasonably constant voltage and in sufficient volume to meet the requirements at all times, there are many advantages in purchased power, entirely apart from the question of a saving in power cost, as for instance: Flexibility of installation, with means always to provide for extensions or to meet temporary demands for increase in production, without having to make any changes except perhaps the installation of one or more additional motors. Frequently the motors already on hand will take care of the increased demand through their overload capacity, while additional demands might readily overload the private power plant to a dangerous extent.

If the power requirements are reduced, owing to slack times, or to shutting down part of the factory for any purpose, there need be no reduction in efficiency of operation because of the necessity of keeping an independent plant running to provide an amount of power much below its normal capacity.

Power is available at all times, day or night, to provide for overtime operation, without the necessity of keeping up an independent power plant and paying wages for overtime or for any extra fireman or engineer.

There is less risk of stoppage or interruption of service from a central station that is properly equipped and well managed than from an independent plant, due to breakdown, strikes, or other causes.

The factory may be started more quickly, as there is no necessity of getting up steam in boilers or of going through numerous preparatory operations in getting a gas engine plant into commission.

Determination of Power Needs

In making selection of proper motors, the value of experienced expert advice is almost indispensable, as a careful and intelligent series of tests must be made to determine the power required to drive each group of machines and each machine which is to be independently driven, and the type and characteristics of motor to be used for each class of service.

In determining the power required in an engine-driven plant with line shaft and belt transmission, it is not entirely satisfactory to employ the method frequently adopted, of indicating the engine and cutting off parts of the plant in sequence to obtain the power required for the different groups or individual machines, and then cutting off all machines to obtain the transmission losses, as this method is, at best, inaccurate and does not account for the live load bearing and belt friction losses, which in many plants amount to a considerable percentage of the total losses; nor does it give a record of the time factor in the operation of individual machines; or the variable losses due to changing or intermittent loads; and it does not give the load cycle of machines operating with a periodic load variation, such as punches, presses, planers, etc.

The most reliable method of determining power requirements is by a temporary installation of one or more motors to drive the different machines or groups. Tests can then be made which will give curves of power consumption and speed variation, and from this data the size of motor can be accurately and positively determined as well as the speed and torque characteristics, the speed re-

gulation and control, and the proper overload capacity required to operate machines under most efficient conditions for the work to be accomplished.

Selecting Suitable Motors

The selection of suitable motors from this data can be made only from a thorough knowledge of motor design, in order that the motor selected for each machine or group of machines will have the proper inherent characteristics.

Certain classes of machines require, due to their specific load conditions, a form of speed control that can not be efficiently obtained with alternating-current motors, and in such cases they should preferably by driven by direct-current motors, even though the general adoption of an alternating-current system requires the installation of apparatus to convert a portion of the power from alternating to direct-current for this purpose.

Other types of machines, while operating at variable speed, will have load characteristics that will permit the use of alternating-current motors with good operating conditions and efficiency.

Some machines will require motors with very heavy starting torque, though running under light loads when up to speed, while others will have very light loads at starting but may require motors of large temporary overload capacity.

All of the above and many other operating conditions enter into the problem of determining the proper motors to give the best average or net results, and their proper consideration is vital to the success of the installation.

Electric motors will carry overloads beyond their normal capacity, but motors are built to carry overloads of different values, all the way from 25 to 100 per cent. above rating, and for different periods of duration, and these facts should be taken into consideration in making a selection.

The Making of Quartered-Oak Stock

By Chas. J. Brey

Throughout all the fluctuations of a changeable market in hardwoods, no wood has held its price so well and steadily as quartered oak. It would seem that the law of supply and demand is, after all, the real dictum of price in such commodities as are not liable to be cornered, and the bearish element has no noticeably depreciable influence on the market. In this case there is perhaps no probability of any slacking in demand or depreciation in price until the cost approaches that of other high-class furniture woods, which are, in consequence, given the preference, for it should be borne in mind that the public taste is easily turned to other woods that have been neglected, yet are not only serviceable, but often beautiful as well, when properly handled and finished. With quartered oak nearing the price of mahogany, the latter wood is enjoying an unprecedented demand, and its richness of figure retains all the distinctness it deserves in the higher grades of furniture and interior finish. But plain mahogany itself is given a preference that may react upon oak in an astonishing degree.

It is true that oak fills a place so distinct that none other may take its place in its entirety. The ease with which it is finished and the hard usage it endures have given it such an eminent standing as a furniture wood, as well as in all its other utilities, that it will ever be in favorable demand to the last—and that last, as pertaining to quartered oak in merchantable quantities (one is not encouraged to specify quartered white oak), is not so far distant, for it requires from medium to large trees to permit quarter sawing, and trees of that size cannot be grown in a generation. So let us consider the best way to lengthen the days of quartered oak, to make the supply we have as elastic as possible. It would be useless to attempt to curtail the output, as every timber owner has his mind's eye on all the large oak trees that permit quarter sawing.

The one way to make a tree or log go farthest, considering surface measure, is to convert it into veneer. It requires a good class of timber to make good veneer, but the demand and price for flitches is such that it is worth while for any mill man who has even an occasional carload of such logs, to separate them and either sell them as logs to veneer manufacturers who own their own mills, or to saw them into flitches. The latter would probably appeal most to him who desires to keep his mill running; and, often, one finds logs that, while they would not be classed as merchantable veneer logs, will make some good flitches. Of course, the best, largest logs should be reserved for veneer. This often arouses the objection of the lumberman, he claiming that the impoverishing of the upper grades depreciates the value and the marketability of the lumber beyond the advantages gained in flitches. A close investigation of the matter, however, proves this erroneous, and while monetary results must be left to individual price lists, a comparative list of the results in board-feet measurement may be found of interest.

In the sketch a 36-in. log is dissected, with results as given. According to Scribner, a 36-in. log 12-ft. in length contains 768-ft. board measure. Now it is usually considered that a loss of twenty per cent. results in quarter sawing. However, a statement by a veneer manufacturer that he obtained the amount of flitches in feet, board measure, that were credited to the log scale, seemed unusual, and led to further experiments; for it should be borne in mind that the veneer trade demands the best figure obtainable, also the greatest widths; in fact, such stock is at a premium.

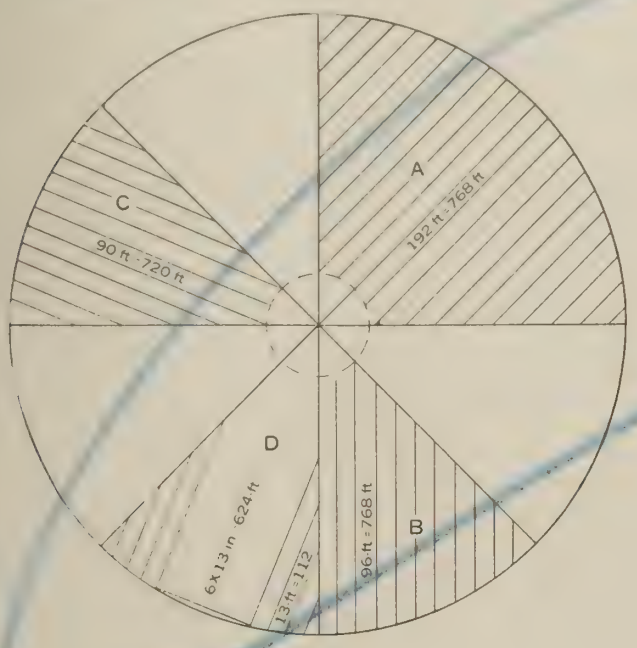


Fig. 1.

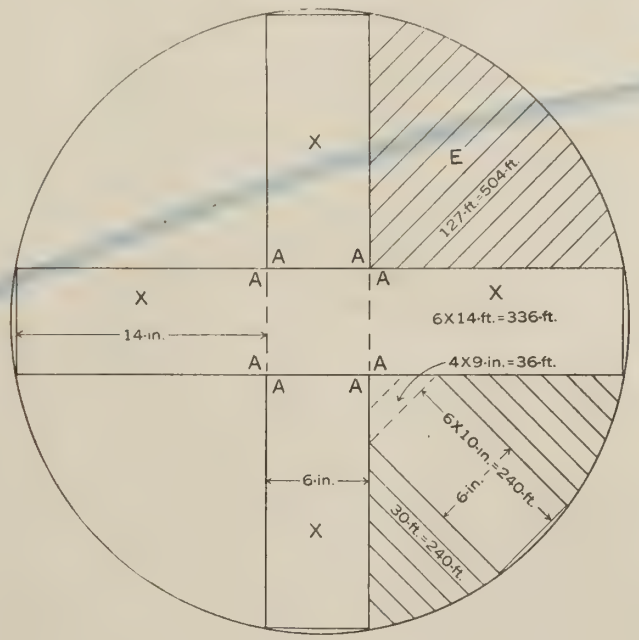

Fig. 2.

Of course, all handlers of oak know that the nearer to the medullary ray the stock be cut, be it lumber or veneer, the better is the figure. That is, there the flake is most prominent. Now, to accomplish this it is customary to saw the logs into as many sections as convenient, depending somewhat on the size of the log, of from four (from which perhaps quarter sawing derived its name) to eight or twelve, and in very large logs as many as sixteen sections. Now, flitches 6-in. in thickness are the maximum for good figure in a 36-in. log. The upper corners, A A, Fig. 2, will show but little figure, but in logs with a strong medullary ray a thin pencil stripe will be seen. This is one reason why veneer men prefer the flitches as in D, Fig. 1. It gives all possible width, with the best figure.

But let us first consider quarter sawing of lumber. In Fig. 1, A and B yield the greatest amount of lumber, or the exact amount of the log scale—768 feet. Section A is a full quarter and is cut up with only one turn, that to the knees. Strips 1 and 2 are only bastard cuts

and are marketable as flooring strips; all other boards are of sufficient width to grade as firsts and seconds. Section B, one-eighth section, is in results much like A, and is usually used when half of the log is tilted back four or more times, and so saves considerable handling, requiring the turning of the last one-sixteenth section only, all the back-tilting being done by receding the knees only. The best results, however, are obtained, concerning figure, in section C. The loss in measurement is 6.25 per cent., and it depends upon the class of customers the mill man sells to, as to whether the loss be justified. The advantage is that every board shows figure, and the loss is caused by the edgings being of such slender taper.

The sawing for flitches presents much the same problems, with the one idea always predominating—figure and width. With the true white oak, which has perhaps the most apparent medullary ray, it is an easy task to obtain at least some figure, but many species of "near" white oak require careful handling, close up to the flake, to make a showing. For all such woods proceeding as shown by section D, Fig. 1, is best. In fact, many veneer men who have their own mills quarter all their stock that way; they lose nothing in measurement, as each sheet of veneer is measured, and thus they can leave the flitch as tapering as a defective heart allows.

The full measurement of such a flitch would be about 96 feet, and the eight flitches would just equal the log scale, 768 feet, with approximately 112 feet of strips and lumber addition. But according to the prevailing custom the tally for such a flitch would be 6 x 13 in. by 13 ft., equals 78 ft., or 624 ft. for the eight of them. Now, this difference in measurement has often been the cause of disagreement. A thorough understanding of the measurements of flitches should be had at the beginning, inasmuch as these flitches present the best figure and all the width it is possible to command; a price that will permit of the loss of measurement and time in handling should be agreed upon. Fig. 2 is a fast way of disposing of the log, and has advantages that appeal to many mill men. The heart, which, when sawn into strips, is usually of no other value than fuel, therefore in many cases is only an additional expense to dispose of, can here be boxed and used as tramway ties, stack foundations, etc. Then we have the four flitches, 6 in. by 14 ft. equals 336 ft., and four flitches, 6 in. by 11 ft. equals 264 ft., a total of 600 ft. in ditches and 240 ft. in strips and boards, a very creditable gain. The principal objection to this modus operandi is that the upper corners, A A, of the four large flitches show but little, if any, figure, and so reflect badly on the entire sheet of veneer.

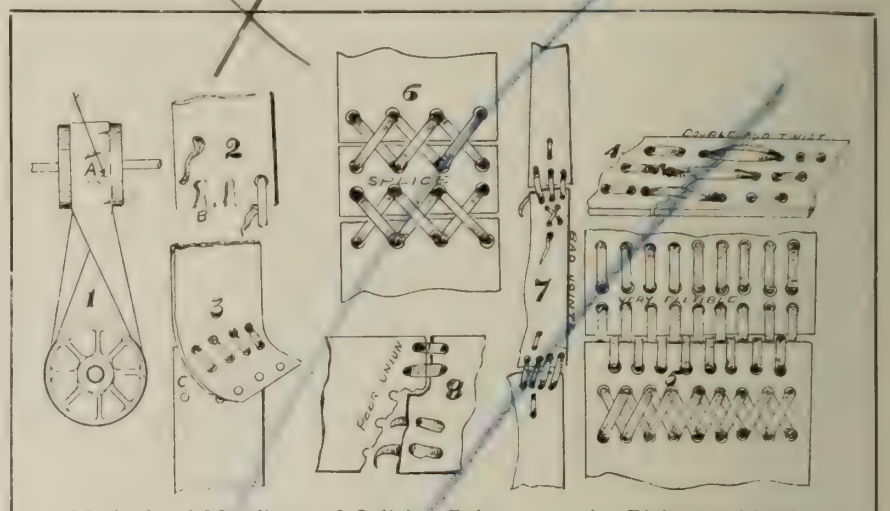
From these figures and the sketches we see that in neither case have we reached the full log scale in flitches, although we have that amount (768 ft.) in lumber in A and B, Fig. 1, and in Fig. 2, with combination X (336 ft.) and E (504 ft.), we have 804 ft. board measure. This would seem to show that the loss over the log scale need not be feared, nor keep one from quarter sawing suitable logs. Care and judgment must, however, be exercised, especially in the loading of the log, considering all the defects and shortcomings as well as the advantages of the logs. Knots and other defects should be left on corners where they do least harm. Splits are to be turned to the saw line, unless more serious defects prevent. But if the heart be to one side, then take advantage to get that extra wide stock. In a crooked log save at least the two parallel sides in full width, and let the pencil stripe come into all its prominence in a twisted log. Use the taper levers on the knees to full advantage in swell-butted logs, that you may follow the pith of the log, instead of the centre. And always keep as near the medullary ray as possible.—The Wood-Worker.

Sources of Vibration

When a machine, a group of machines, or an entire plant, shows annoying vibration, the cause therefor and the source thereof may be entirely different things. The source of most machine vibrations is lack of balance and uneven loads, which latter is merely lack of balance in another form. But the things that cause most of the vibration in machinery are belts. The belts may not always originate the vibrations, but they pass them along, add to them, and sometimes create them. To get an object lesson on this point, one has but to go into a shop or factory electrically driven, with individual motors throughout, then into a belt-driven plant of some magnitude, where there are lots of heavy belts. The belts are the medium of transmission and acceleration in the factory, like the strings on a violin are the medium of sound transmission and creation. Individual machines may show jerky vibrations when electrically driven, but the disturbance is localized, whereas if numbers of belts are coupled up into a great system the vibrations are distributed, joined into others, so that all machines are affected by both their own and the troubles of others. It is not the electricity that does away with this, but the separating and isolating of the sources of vibrations. Take a belt-driven drag saw, and the jerk of its uneven load can be felt through the entire factory. Cut it loose, make it direct-acting with a steam or air cylinder, and the disturbance ceases. Vibrations originating in the different machines are like small sticks, in that they are comparatively easy to break up singly, but hitch them all together with a system of belts and they are like a bundle of sticks firmly bound together—a pretty tough proposition to break up. And it may be fittingly added that if the belting is uneven in weight or lacking in balance in any way, it adds materially to the source of vibration itself.

Belts for Lumber Working Machinery

Belts employed in the operation of woodworking and finishing machinery are exposed to more severe atmospheric conditions than the common belt. Ordinarily the running belts are confined within apartments in mills or shops, where there is a fair protection for them; but in the lumber working interests one may find belting running in the open, conveying power from an engine which may be established in the woods to the lumber cutting machinery also not sheltered except, perhaps, for a crude roof thrown up over them. The belts of exterior lumber cutting service are subjected to the rains, the sun and the dust. These three factors combine to ruin a belt in a few months, unless precautions are taken to overcome some of the troubles. There is often considerable building of sheltered passages for belts in the fixed plant; but when the sawing plant is of the portable character there is not much time or material wasted in erecting covered ways for belts. The belts have to take the pelting of the rains and the baking of the sun. Therefore, belts of lumber working yards are likely to have numerous defects in them.



Methods of Mending and Splicing Belts — An Elaborate Mend

In Fig. 1 herein is shown the manner in which an exposed belt usually breaks up. The constant heating, drying, wetting and chafing of the uncovered leather results in hardening and cracking along the edge as at A. Of course, lubricants can be applied to soften the leather, and these will impregnate the fiber and help to some degree, but even the oils become noneffective as time passes and dust gathers in quantities on the surfaces. The dust hardens and is worn down to a smooth gloss on the wheels and the surfaces of the belting. When a belt gets to the stage shown in Fig. 1 it is time to substitute a new one. The chances are that the new one will go to pieces the same way, in time. In order to overcome this danger a covered passageway can be erected at small cost and in a short time to prevent the elements from ruining the belt.

It is becoming more and more common to use covered ways for running belts in lumber yards. In some cases the portable plants are provided with adjustable sheet metal runways through which the belt may be passed when the outfit is set up. The exposed belt decays rapidly at the joints, so that in time the holes may pull out as shown at B, Fig. 2. When the holes break out in this manner the end must be clipped off to present a fresh surface; then the holes pull out again and once more a piece is cut off, which takes some of the leather out each time and makes the belt shorter, and a piece must be spliced in. The exposed belt of the lumber yard is liable to break apart at the joints, as at C, Fig. 3, because of loosening of the cementing stuffs resulting from moisture on them. In order to prevent the joint from severing entirely a row of lacing is put in, as shown. Strenuous efforts are made to make the unions hold under adverse conditions. Figure 4 shows how one man introduced a triple system of lacing. He punched six rows of holes and laced the centre with the double twist type of lacing. This distribution of laces would make a firm grip under ordinary conditions; but when a belt is in a weakened condition through moisture and general exposure the rotting leather will pull out at the holes regardless of the system of distribution of the laces.

The system of lacing shown in Fig. 5 is somewhat elaborate. The workman had experienced trouble with the belt breaking at the

joint. He had adopted several methods for completing a joint, still the laces pulled out or the ends of the belt tore off. Then he devoted considerable time to the complicated belt sewing illustrated. He put in his series of holes, all close together, as will be observed. When he got to the middle lacings he arranged the laces to fit alternately above and below the joint, thereby making a most pliable union.

Figure 6 is given to show one way employed by the mechanics of a certain lumbering establishment of making a union with a splice piece inserted. It will be noticed that the crosses are confined to one side. Often in inserting a piece in a belt to make up for the bad ends that have been clipped off, the laces are made straight and crossed on the same side. This mixture of straight and crossed laces always develops trouble.

In Fig. 7 is shown the kind of belt that should be avoided, for the reason that it is patched and remade in places. In case a belt has to be used after it is patched a number of times pains should be taken to have the joints cut evenly and laced. If the splice is uniformly made it should not hinder the run of the belt; but if the splices are poorly made, as in this figure, the belt will give endless trouble. Belts in use on struggling machines like this are sure to militate against the performance of good work. Often belts on important machinery in lumber yards operate in as bad condition as shown in Fig. 8. In case a belt thus united has much work to do, the strain will quickly tear open the union; but if the work is light the patched joint may run on indefinitely, but giving poor service.—American Lumberman.

Sanitary Fundamentals

Since the most important factor in efficient service is the health of those employed, it is scientific management to control environment by constructive measures; more especially, to do everything possible for the promotion of the health, comfort and contentment of the force and to use means to ward off disease, writes Dr. Oscar Dowling in the American Lumberman.

In a camp the general features are sanitary conditions, including situation, water supply, sewerage and waste disposal; more particularly, with reference to the individual, food, medical care and sanitary discipline.

The camp should be placed on high ground near an adequate and healthful water supply. The situation of sanitary conveniences is important that odors may not be carried by prevailing winds toward the sleeping quarters. Kitchen refuse and all other objectionable waste should be burned or buried, and at some distance from the water supply. There should be provision for bathing. Even in the most primitive camps a tent, or hut, should be set aside as a bath room. This is practicable and necessary, even if the daily bath is only a rubbing with a wet towel.

Plain food, well cooked, is generally provided, but variety is lacking. It is a mistake to confine the diet almost entirely to meat and bread.

Perhaps the two most difficult features of management are medical preventative measures and sanitary police supervision. Recklessness and ignorance on the part of the majority make both obnoxious, yet both are necessary for the inauguration and maintenance of hygienic conditions. Stringent rules should be enforced relative to the use of sanitary conveniences for the protection of all, and as far as possible the men should be taught the dangers of excess in eating and drinking and the more imminent danger of all classes of communicable diseases. A man with tact and knowledge of these things should be known as a sanitary police officer and should be given a definite, if limited, authority over the men in these matters.

In reply to the question, "Is it healthful for men who work in the woods to drink icewater?" it is asserted by many medical authorities that the drinking of icewater is very injurious. A minority contends that in moderate quantities, particularly between meals, it is not harmful. Dr. Seneca Egbert, professor of hygiene and dean of the Medico-Chirurgical College of Philadelphia, says:

"The inadvisability of using icewater freely as a beverage should be mentioned as a habit most certain to cause much harm to the digestive apparatus and to give origin not only to intractable dispepsia, but to troubles more serious. If used at all, icewater should be taken slowly and in small quantities and as little as possible at meal times."

From more recent writers on diet and hygiene, we take the following: "Icewater will stimulate a more rapid and a greater secretion of gastric juice, but lessens motility of the stomach. Iced water in excess is injurious and should not be taken when one is overheated."

"To flood the empty stomach with icewater is not wise, for in real excess it may delay digestion a little."

On the other hand, from the time of Alexander the Great history is full of stories relating to the use of ice and snow. The prejudice against the use of ice seems to be the exclusive property of the minority, for now, as in the days of Nero, the majority adhere to the custom of the use of iced water and frozen delicacies.

Personally, I think the immoderate use of icewater at meals, and among working men excessive drinking of iced water, which begets a constant thirst, are injurious.

Ice made from impure water may contain bacteria, which will contaminate water otherwise pure.

Finishing of Stock for the Box Printer

It is now an era of more exactness in planing-mill work than we ever had before. There are various influences exerting themselves in this connection. One of these that perhaps may seem peculiar to some branches of the trade, but is familiar to the box factory, is that of the exacting requirements of planing work to put lumber in proper shape for the box-board printer.

Talk to a maker of printing presses for the box factory and the chances are he will say that their greatest difficulty is to get the planers and planer men to make stock of exactly uniform thickness.

Close Measurements in the Box Business

It is easy enough to get stock that is seemingly of uniform thickness, but when it comes to the exacting needs of a printing press, where just a little variation makes a big difference, it is found that exactness in thicknessing lumber for the printing press is a thing for microscopic measurement. In brief, it is getting it down finer than the average planer man is in the habit of doing.

There are two kinds of trouble. One is the variation in thickness of stock dressed during different days, and the other is the variation of thickness from one edge of the stock to the other. Just the least variation will show up where neat printing is being done. The harder the wood, the more aggravating is this variation in thickness.

In a talk on this subject with the superintendent of one of the biggest box factories in the country, he explained that he was looking for something new in box printers, something that would adjust itself to the variations in the thickness of their stock.

When this was taken up with the makers of box printers they said it was a sort of impractical proposition, because to provide a cushion or spring to the printers was to impair the clearness of the impression made. Furthermore, the printing press man argued that the box factory man should look closer after his planers, he should establish certain standards for thickness and insist that his stock be kept up to these standards.

The Sander for Finishing Box Stock

Now, while this much of the present story and argument is fairly well known to box manufacturers, even though it may be news to some people in other lines, there is something else; something that perhaps has not been thought of and experimented with enough by the box men themselves, and that is the idea of using the sander after the planer for finishing the box stock.

That the sander would improve it there is no question, but the average box manufacturer would perhaps at first figuratively throw up his hands at the idea of finishing his box lumber through a sander.

He doubtless thinks he is spending quite a lot on it to put it through a smoothing planer, and then if the boxes call for a little smoothing off with sandpaper it is generally done on a disk wheel or belt and is usually confined to sanding the corners and doing a little smoothing off after the box is nailed together.

Really the logical time to sand box material is before it goes to the printer, and if it is a lock-cornered box, preferably after the lock has been cut. There are several side issues and arguments that might be developed in this connection, but the one main point in mind right now is the one we will follow, and that is the advantage that sanding through a regulation drum should offer to the box man who is making a strong feature of elaborate and artistic printing.

It would not only minimize the trouble that has been complained of so long in the past about variation in thickness, but it would also give a better surface for printing. Those are the two important points that it is desired to bring out here, and to impress as strongly as possible in the hope that they may lead to the coupling of a sander on to the regular line of box machinery. The first one is that of getting the size more uniform, because the sander will take care of some of this slight variation complained of. The other important point is that a sanded surface is or should be a much better surface to print on than a surface fresh from a planer.

The surface coming from a planer is slick and glossy and will not take the ink of the printing press as readily as a surface that has been neatly sanded. At least, that is the opinion of the writer, and it looks like this and the other point of thicknessing should make a pretty strong argument in favor of using the sander more extensively in the box factory.—Wood-Craft.

Application of Electricity to Logging

Some Practical Observations Upon the Practical Side of the Question with Special Reference to the Expenditure Involved—Actual Comparative Costs

By Frank MacKean

In this brief article we propose to describe the method of the application of the mystic force of electricity to the homely task of logging.

We will assume that there is a small brook near your tract of timber, and that upon examination it is found to be four feet wide, one foot deep and flowing four feet per second of time. There is hardly a good sized body of timber on the coast that does not boast of one or more of such streams, quite often many times larger.

The topography of the country is such as to make it comparatively easy to find a place in the stream where the banks are high and the gorge or bed of the stream is narrow for locating your dam or diversion works. This point should be selected with a view of a good foundation for these works, shale, clay or rock being necessary to make the structure reliable.

Determine Head to be Utilized

The next step is to determine the head, or the height in feet, that can be utilized in the fall of the stream. As a hypothetical case we will assume that in its course of 1,000 feet down the valley the brook falls an even 100 feet, and that the diversion works has raised the water another 10 feet above the bed of the stream, hence, between the level of the pond and the site of the power plant we will have a difference of 110 feet. Water power is exactly proportioned to the amount of water in a stream, times its fall in feet, reduced to foot pounds and then to horse power.

Diversion Dam Cheaply Constructed

Assuming that the improvement is to be made solely for the purpose of logging off the land and in no sense to be permanent; the diversion dam can be constructed of logs, built of the gravity type planked on its upper slope with tongue and grooved 2-inch flooring and the intake pipe placed at least three feet below the proposed dam water level. A spillway over the crest of the dam or around it should be provided, ample to carry any flood waters that may come down the stream, and care should be used to see that the discharge in the stream is far enough below the dam to not undermine it.

The Pipe Line

The next step is the pipe line. As we have 16 second feet of water, and six feet per second is about the economical limit of velocity in a pipe line we will require an 18-inch diameter pipe to carry the water down the 1,000 feet of slope from the dam to the power house.

Care should be used to see that the hydraulic gradient is not departed from in laying the pipe line or you will have a severe loss of head in your plant.

Installing Water Wheel

The water wheel should be of the horizontal turbine type fitted with an automatic governor, and for the particular development here outlined should be a 12-inch wheel with steel case and steel draft tube, and set 8 or 10 feet above the tail race or ditch carrying the water away from the wheel.

The Power House

The next step is the power house, which can be built the same as the other camp buildings, of rough lumber. The only extra care needed is in preparing the foundation for the water wheel and electric generator, which should be firm and well set. Concrete could here be employed to good advantage even for a temporary plant, but logs cribbed and drift bolted will answer if properly placed. The generator should in this case be a 150 horse power direct current machine of the multipolar type, 600 volts, and direct connected to the water wheel. This is important, as a compact installation is necessary and one that is as near "fool proof" as possible and the entire plant should be as nearly self-regulating as it is possible to make it. The switchboard, a marble slab set on an iron frame at one side of the room housing the power plant, should carry one or more switches, an automatic circuit breaker and a volt meter and an ammeter with a pilot light, and a rheostat. The wiring can be either single or double circuit as the conditions may warrant. By grounding one side of the electric machine and one side of the motors, one wire is all that will be required for operating the system. The wires should be rubber covered and double braided to protect the insulation from abrasion and then a cheap wooden bracket and glass insulator can be tacked to the trees to get it to the point of usage.

Equipment of Logging Donkey

The next step in the equipment is the electric donkey. This is substantially the same in the arrangement of drums and drum control as the steam outfit, but the frame is made only long enough to carry the drums, and under the main shaft (which in the steam donkey is the engine shaft) the iron-clad electric motor is bolted in and a gear is keyed to it and meshes into the pinion on the motor shaft. Under the haulback drum is another small drum which is fitted with two friction contacts and carries coiled thereon a duplex braided specially insulated stranded electric cable which supplies the donkey with electricity. With this equipment the machine can be moved around in the woods by its own power exactly the same as the steam outfit.

Falling and Bucking Rig

The cut-off electric saw consists of a small one-half horse power motor geared to an 8-foot cross-cut or falling saw with a frame fitted with hinged tripods that are set up on the ground and fastened to the tree to be felled, in such a position as to allow the saw to work properly. The current is supplied to the motor by a feed wire of the same design as that on the donkey. One man only is required to operate this and in thick timber he could easily attend to three as well as one. This outfit will do the work of five men easily. The same saw can be used to "buck" the trees into logs, as the tripod is adjustable to make the saw operate either horizontal or vertical.

The foregoing makes up the ensemble of a complete electric logging outfit from the brook to the skid road or delivery point of the "yarder"; and in this article we propose to confine ourselves to this division of the logging problem only.

Comparative Costs

The next and most vital question to answer and digest is the cost of the electric system of logging, and we are going to not only give the figures for this but also those of the steam outfit of equal capacity, in proof of our statement as to the economy of the electric outfit.

Power Plant

Intake and dam	$ 50.00
Pipe line, 18-inch wood stave (continuous), laid	640.00
Water wheel, installed (200 h.p. capacity)	300.00
Power house, shed construction	150.00
Electric generator and station instruments (D.C.)	950.00
Wiring (say one-half mile)	400.00
Total cost, ready to operate	$2,490.00
Electric donkey, complete with 50 h.p. motor geared 8 to 1, with same drums and equal to a 9 x 10 inch steam outfit and guaranteed to do the same class of work	950.00
Electric falling and bucking saw, takes one man to run it; will do the work of five men	150.00
Complete equipment up to roader point in logging operation	$3,590.00
To this amount should be added for 65 h.p. "roader" donkey	1,150.00
Extra line construction for same	250.00
Making the total outlay for a complete electric outfit to deliver logs, say 3,000 feet	$4,990.00

To operate this outfit will require the following fixed costs, to get an output of 80,000 feet of logs per day:

Interest on investment, at 10 per cent., to cover contingent extras, $490 per year, or per day of 300 working days in year	$ 1.66
Depreciation, five per cent.	.84
1 Electrician at power house	4.00
2 Electricians at donkeys ($4.00 each)	8.00
2 Choker men ($3.00 each)	6.00
1 Sniper	3.00
1 Chaser	2.50
3 Rigging slingers ($3.50 each)	10.59
1 Signal man	3.00
1 Faller and bucker to operate electric saw	3.50
	$ 39.00
To this add another $2.00 for repairs especially chargeable to the electric equipment	2.00
And we have as the total daily cost of operating	$ 41.00

Or a cost of 51¼ cents per thousand from the tree to the water, on 3,000 foot delivery.

Against this electric showing we have the digest of logging costs by steam under average conditions as published in the October, 1910, "Timberman" by Mr. J. P. Van Orsdel, of Portland, logging engineer:

Cost of falling and bucking by hand, 1,000 feet to log, average	$0.55
Yarding same, 900 ft. haul 1,000 to log, average	.65
Roading same, 3,000 ft. average haul	.30
Total cost per M.	$1.50

He gives the capacity of the machines at from 50 M. to 75 M. per day of ten hours.

He also gives the crews for this daily output as follows:

Two sets fallers, three buckers.

For the yard engine crew he gives one driver, one fireman, bucker, one chaser, one hook tender, two rigging slingers, one swamper and sniper, and he figures their time at $26 per day.

His roader crew is given as one engineer, one fireman, one wood bucker, one chaser, one grab man, at a cost of $32.50 for labor and upkeep, etc.; so we will have to assume that the same schedule of wages has been used as for the yarder crew. This would make the labor account as follows:

Engineer, $4.00; fireman, $3.50; bucker, $3.00; chaser, $2.50; grab man, $3.00, making a total of $16 per day, which certainly shows a very large allowance.

In his analysis of the upkeep of the yarder he also allowed $10.00 per day. There is a wide diversion of opinion as to these costs and we feel inclined to split them in half to arrive at the comparative figures.

4 Fallers, at $3.00 each	$12.00
3 Buckers, at $3.00 each	9.00
Yarder crew	26.00
Roader crew	16.00
Yarder upkeep (½ estimate)	5.00
Roader upkeep (½ estimate)	8.25
At a total daily cost of	$76.25
As against the electric cost of	41.00
Leaving a net daily saving of	$35.25

Horizontal Resawing

Horizontal resawing has gradually become of some importance as a factor in box manufacturing especially. It enters more or less into some other lines of milling, but its main hold is in the manufacture of boxes and box material and in this branch of the trade it has made much more progress than the little writing that has been done upon the subject would imply, says the St. Louis Lumberman. In fact, there has been but little said about it, about the relative merits of horizontal resawing as compared to the regulation upright except by box makers and salesmen who seek to fit them into special lines of work here and there. The students of technical woodworking have had very little to say about the relative merits of the two styles or the particular points that make one class of resawing advisable as against the other.

The first point that probably led to the adoption of the horizontal resaw in this country is the advantage of it in handling short length stock. The horizontal resaw equipped with a hopper feed becomes almost an essential machine where it is desired either to handle the short length lumber or to refine and cut up lumber into box lengths before resawing. Probably the original idea was to facilitate the using up of short length stock from the mills, that would otherwise go to waste, but there is developing a new idea in connection with lumber working, that is, not new in its conception, but new in its prominence, that overshadows the first consideration of the unavoidable short lengths.

This new plan or modern idea is based on refining lumber and eliminating as many of the defects as practical before working. And it is of more importance now than formerly, because of the great quantity of low grade stock that must be used. In the cutting up of low grade stock that must be used. In the cutting up of cull lumber or low grade boards if the cutting can be done before resawing it makes easily practical the eliminating of a lot of knots and defects and by so doing it not only reduces the volume of useless work that must be done at the resaw, but also it relieves the saws from the cutting of hard knots that is a big item itself. Indeed, there are many who claim that the working of knots on resaws, or planers either for that matter, does more to wear out and dull the cutting tools than all the good lumber between the knots. Consequently, the eliminating of knots in low grade lumber before working is quite an important item. It probably forms one of the most important considerations in connection with the horizontal resaw and is no doubt responsible for no small part of its growing prominence in the box making trade and in other lines of milling where short stock is to be resawed.

Another important consideration in connection with the horizontal resaw is the advantage offered in working up mill slabs of the kind that could not very well be fed into the regulation resaw. At least this is true of some of the horizontal resaws offered. Some of them are built with the special object in view of taking slabs and reducing them to short lumber stock. In other words, to box shook material. It enables the sawmill man to utilize more of the slab stock and incidentally it increases the quantity of short length material that the mill will furnish.

In some instances where the mill goes into the shook business this short length material is worked up right at the mill in the form of shooks, and this is probably an excellent way in which to make use of the horizontal resaw, to make shooks as a sideline to sawmilling. But, even if the mill does not enter the shook business itself it might work a lot of short length lumber out of slabs and other stock about the place, either cut to thin box sizes or into regular lumber thicknesses to be resawed afterward by another horizontal saw at the box factory end. Or, for that matter, to manufacture any kind of short length stock, the thickness and dimension being governed by the purpose for which it is marketed.

Aside from these features it is probably an open and debatable question as to whether there are any advantages in the horizontal resaw. A band saw is a band saw and may be made to do its work equally well no matter just what position it runs in. The matter of position or attitude of the saw in relation to the perpendicular and horizontal is more a matter of the facilities and convenience it offers in connection with working out the other details of the sawing machine and feeding mechanism. The saw itself should work equally well in either an upright or horizontal position or at an angle for that matter. So, it reduces itself to a matter of the opportunities it may furnish in a certain position for a more advantageous equipment of feeding devices, etc. The horizontal resaw furnishing a flat bed to feed on naturally offers better facilities for equipping the hopper or automatic feed to handle short length stock.

These same things may be both possible and practical in connection with the perpendicular resaw, but not a great deal of attention seems to have been given to their development, at least not before the coming of the horizontal resaw to demonstrate the advantages in certain instances of having something different from the regulation feed rolls of the general type of band resaw.

The horizontal band saw is well known in Europe not only for resawing, but it has for years been conspicuous in mill sawing. Just why the Europeans prefer the horizontal type of mill sawing is a matter that has been the subject of some discussion without really developing any very strong points of advantage. Points that will in any way equal the advantages offered in the American type of mill saw. The horizontal idea never gained any prominent recognition in lumper operations in this country, and the horizontal resaw idea is a product of the present decade and seems to have developed primarily for the sake of handling stock cut up into box lengths before it is resawed through the means of an automatic hopper feed. As the tendency to do more refining on lumber before it is worked and eliminate more of the defective material and especially the knots before putting it through the machine gains in value and prominence so will the demand for horizontal resaws spread, even perhaps down into the woods among the mills quite extensively where there are opportunities to work slabs and scraps into box shook material. Just how far it may enter other branches of the lumbering and wood-working industry is a matter of conjecture, but so far there does not seem to be any strong tendencies except where it is desired to embody the hopper feed and work short stock.

A cigar salesman, who was called upon for a speech at a banquet attended largely by politicians, made a hit with the following remarks:

Men are like cigars. Often you cannot tell by the wrapper what the filler is. Sometimes a good old stogie is more popular than an imported celebrity. Some men are all right in the show case, on display, but are great disappointments when you get them home. No matter how fine a man is, eventually he meets his match. A two-fer ofter puts on as many airs as a 50-center. Some men never go to the front at all except during campaigns. Some are very fancy outside and are selected for presents. Others have a rough exterior, but spread cheer and comfort about them. Men, as all cigars, good or bad, two-fer, stogies, rich or poor, come to ashes at last.

It is claimed by some that it does a band saw more harm to run idle than to be cutting. Whether or not this is true, it is at least a waste of power. When there is no work for the shop band saw it should be shut off.

Skidders and Skidding Accessories

In any system of logging unexpected and excessive strains are encountered as well as severe regular work. It is necessary, therefore, not only that engines should have heavy gears, drums and bedplates, but that the entire equipment of blocks, fittings, ropes and incidentals should be of proper design, size and material.

It is clear that in any system of skidding where logs are hauled over the ground great resistance is offered to their passage by the ground itself. This resistance will be greatly increased by the underbrush, roots, stumps and other debris.

The regular slack rope or rehaul system, with one powerful pulling drum and one high speed outhaul drum, dispenses with the messenger rope and uses only two ropes, one being the pulling rope and the other the outhaul return, or trip-line for returning the pulling rope into the woods. This return rope is, of course, twice the length of the pulling line.

Various devices are used in slack rope logging to reduce the resistance offered by the obstructions in the woods, among which are special grab chains, the "Baptist" cone, the shoe and log cappers.

The "Baptist" cone is a steel cone through the nose of which the grab chain passes freely. When a log is tongued or grabbed and the pulling line tightened, the log is thrown forward into the cone and in a further passage the cone steers the rope off any obstruction.

The "Butler" shoe is similar in principle to the "Baptist" cone, being a scoop shaped steel shoe upon which the length of the log slips and rides over obstructions.

A homemade device for serving about the same purpose as the "Baptist" cone and the "Butler" shoe is the "Lizzard." This, as all loggers operating in the South, especially in the wet sections, know, is the crutch of a limb on which the front end of the log rests when being skidded.

The distance possible to reach with a skidder will depend of course on the ground conditions, the nature of the logs to be hauled, the size and construction of the engines and the general equipment for overcoming the obstructions offered by the natural conditions. In swamp logging this distance may be as great as 7,000 feet.

In swamp slack rope work the logs may either be dragged together in train, as is usually done on the Coast, or can be pulled in by sidelines. These sidelines vary in length, being hooked on the end of the pulling line at one end and at the other end to the logs to be pulled. By the use of sidelines logs at considerable distance both sides of a run can be brought in or "sidelined."

In slack rope logging in swamps, as well as with this system under some other conditions, it is cheaper to handle timber in long log lengths or in full trees.

The possible length of haul may be increased by a battery of engines or a second engine, a "yarder" in portable form to move readily about the woods; this yarder being used to sideline the logs to the main engine line.

Experience has led to the conclusion that the slack rope system of skidding should be used under the following conditions: When long hauls are absolutely necessary; that is, when the timber extends over 1,200 feet from the nearest reaching point of the road, railroad, stream or mill; on short hauls where the logs are extremely large and the timber cuts less than 8,000 feet to the acre, or where the timber is smaller and cuts less than 6,000 feet to the acre.

In swamp logging where there is no waterway for the use of the pullboat and where the surface conditions make the use of animals impracticable, the cableway skidder is used to advantage. In fact this form of skidder has many advantages that recommend its use under other conditions than those that prevail in swamp logging. The resistance offered to the hauling of a heavy log across the ground always is considerable and inasmuch as the cableway skidder is a device by which logs can be raised in whole or in part from the ground and carried on a wire cable, the power actually consumed in moving the log to the road is much less than when it is dragged on the ground. In the use of the cableway skidder, therefore, when the run has been once cleared little attention need be paid to the surface of the ground.

Most loggers are familiar with the cableway skidder, though opinions differ considerably as to some of the details of operation. The machine is placed beside the railroad track, at the head spar, a stout, sound tree, the limbs of which have been removed to prevent injury to workmen. It has been found practically possible to log satisfactorily all the timber in every direction from this head spar, a distance of from 700 to 1,200 feet, clearing at each setting from 30 to 50 acres, according to the length of cables used.

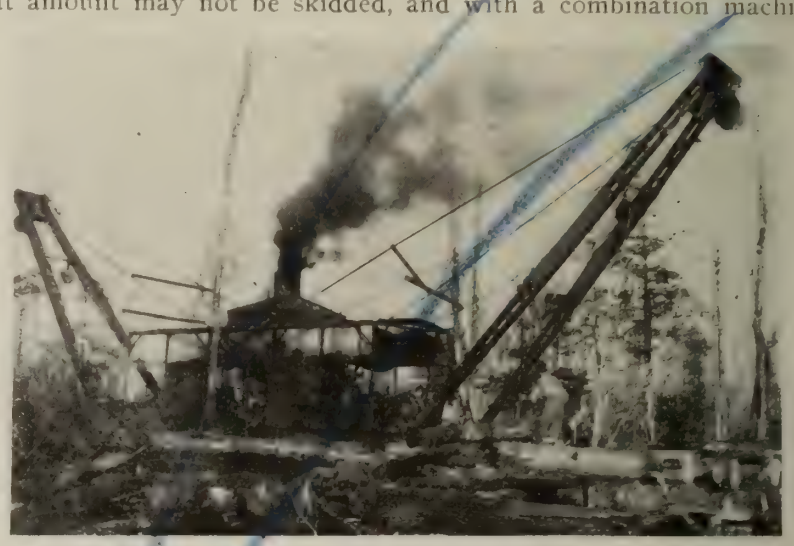
The process of gathering the logs gradually rotates around the head spar, a new tail tree being selected every 200 or 300 feet, the distance depending upon the rigging crew. If this crew is experienced and has no difficulty in keeping ahead of logging operations, the shorter the distance between the tail trees, the more economical are the operations. Of course the logging crew is always at work preparing the next tail tree while logging is going on.

When all the timber adjacent to one main cable is skidded that cable is dropped by disconnecting from the main cable extension; and the other main cable, which has already been placed in position by the riggers, is connected to the main cable extension and tightened requiring from ten to thirty minutes.

The next tail tree is then selected and a light rope provided especially for the purpose is thrown out on the new run from the head spar up to and around the newly selected tail tree, and thence to the tail tree that has just been deserted. This light rope is then made fast to the main cable that has just been dropped and by means of a winch-head or drum on the engine is drawn in, thus dragging the main cable entirely around the newly selected tail tree. It then lies upon the ground between the head spar and the tail tree on the new run ready to be connected.—American Lumberman.

Economy in Skidding Logs

The economy of the independent skidder and loader as compared with combining the two operations in one machine is dealt with in an article contributed by the Clyde Iron Works, of Duluth, Minn., manufacturers of the four line steam skidder which is being used extensively at the present time. The purpose of the article is to prove that an independent skidder and loader used separately is the only proper manner in which to keep a lumber mill supplied and to get logs out of the woods economically. The combined skidder and loader, except in very small operations, is said to increase the cost of delivering logs to the mill by nearly 50 per cent., and again is dependent upon the character of the timber. If there is a heavy stand it will skid 150,000 a day or more. If the timber is scattered a distance from the hauls, or if the country is rough, one-quarter of that amount may not be skidded, and with a combination machine,



The Clyde Steam Skidder

whatever the capacity of the loader, a man cannot load more than he can skid, and besides an accident to either operation would throw the entire machine out of commission.

The Clyde Universal is said to be the only combination machine that will do this work both well and economically. This machine needs no spur track, neither is it jacked up on spuds to let empties pass, so that it will be readily seen that a move can be made at any time with a minimum of expense and delay. This feature also makes it practicable to move the machine frequently to skid the logs direct to the track at the nearest point. It is claimed for this machine that it will keep the mill owners, railroad, mill and men busy all the time, and deliver the desired number of logs into the mill day after day indefinitely. With many mill men the question of skidding and loading is a vital one and incidentally one that needs considerable attention. The Clyde Company have taken this matter up extensively and are conversant with all questions pertaining to the great question of economy as applied to the lumber mill.

The Late Walter Knight

News of the death of Mr. Walter Knight of Burks Falls, Ont., which occurred last month, came as a shock to the lumber trade. From a small beginning in a sash and door factory in 1885 the late Mr. Knight had developed in the Knight Brothers Construction Company a business whose trade extends from the Atlantic to the Pacific. Born in the world's metropolis in 1860 the late Walter Knight came to Canada with his brother at an early age and first engaged in bush farming. Later they commenced the manufacture of sash, doors, etc., and in so doing laid the foundation of the present successful concern. His brother, Henry Knight, is President of the Knight Brothers Company, Limited.

Millmen Advance Prices on Hemlock

Inspection Rules will be Enforced, and Wholesalers will be Asked to Co-operate

The advisability of advancing hemlock prices, and the enforcement of the inspection rules were the chief topics discussed by the hemlock manufacturers at a meeting held at the Queens Hotel on July 10th last. A large number of the representative manufacturers of Ontario were present. The meeting lasted considerably over three hours and many important matters were discussed. In regard to the advancing of hemlock prices the manufacturers felt, after fairly discussing the question, that trade conditions warranted an increase in certain lines. Several prices of different stocks were said to be low in comparison with others, and as the cut has been forty per cent. less this year, and the cost of production considerably above the average, it was felt that a small advance was justified. The recent hemlock rules compiled by the association, were also discussed to a considerable extent. Some of the members present stated that little or no attention had been paid to the rules by a number of the manufacturers and that in consequence the grades from the different mills were not uniform, and that several millmen were practically making their own grades, which was detrimental to the other manufacturers. The present rules are satisfactory to the majority of the manufacturers, and they will do all in their power to have them lived up to. In the United States they have a standard rule of inspection which is carefully guarded by every manufacturer and wholesaler. In Canada there is no standard system of grading and the hemlock manufacturers feel that it is time something was done along this line.

The rules will be printed on a large card and will be mailed to the different manufacturers and wholesalers throughout Ontario. The following list of prices of No. 1 and No. 2 hemlock was adopted by the members present. These prices will take effect at once.

2 x 4 12-10 16	$17.50
2 x 6-10-12 and 14	16.50
2 x 6 x 16	17.50
2 x 4/12-18	19.00
2 x 4 12-20	21.00
1 x 4/4-8-16	13.50
1 x 6 x 8-16	16.50
1 x 8 x 8-16	17.50
1 x 10/12-8 1/16	18.50
No. 2 1 x 4/12-6 1/16	11.50
No. 2 2 x 4 6-16	13.00
No. 2 2 x 6/12-6/16	12.50

These prices are based on 8½ per cent. freight rate to Toronto.

The next meeting of the association will be held in about a month's time, and all Canadian wholesalers will be invited to attend.

A New Fast Feed Molder

The illustration shown herewith is of the No. 305 Fast Feed Inside Molder, manufactured by Messrs. J. A. Fay & Egan Company. It is a finely built machine, strong and powerful in all its parts, with the newest and latest advantages for rapid adjustment. All gearing is completely covered, and the side heads are hooded. The feed works consist of four rolls, 7 inches in diameter, all driven by heavy gears. It is made in two widths, 12 in. and 15 in., and works material up to 6 in. thick. It is, we might say, a "perfect molder," It is equipped with profile jointing attachment, and positively will not tear out on knotty or cross-grained stock; built with lots of reserve power, and will take care of the heaviest classes of work. The 305 will reduce the manufacturing costs and raise the grades of formed stock.

The manufacturers will be glad to send a large photo, and a detailed description of the 305 to interested parties. Their address is 465-485 West Front Street, Cincinnati, Ohio.

Doing Work Too Well

Can a man do his work so well that it will impair his usefulness to his employer and impede his own progress? asks a writer in the Wood-worker. That probably depends on the interpretation we put on the term. A man can take more pains with, and spend more time on a piece of work than that particular work will justify, but to do work well in a broad sense is to take into consideration the requirements as well as the quality of workmanship.

Not long ago a prominent manufacturer told a story as an incident to another matter under discussion, that goes straight to the meat of this subject, though he was perhaps not thinking seriously of that side of it at the time. He said that some years ago a man came to him for a job as superintendent of his box factory. The man, in urging his claims to competency, told of a factory he had had charge of, and said that the concern had never had any complaints from its customers. "Oh," said the boxmaker, "that indicates very clearly why you are out of a job."

In other words, his point was that this man had done his work too well to make a profit for his employer; that it takes occasional complaints to prove that you are not giving your customers more than they are entitled to. Perhaps the man would not have been given a job anyway, because they were not in need of a superintendent, but on its face here is a case where a man impeded his own progress by doing his work too well.

There is, of course, room for lots of questions and arguments. There is the question of whether or not the manufacturer was right in his logic about it being necessary for a concern to have complaints. The writer knows of one concern that takes pride in the fact that during fifteen years of business it never had a complaint on quality from customers, but this was a business in which quality was an important factor.

There is a question of whether or not making the best of boxes constitutes doing the best work. Some boxes are for cheap, rough service, and it would be a waste of time and material to make them very high in quality. And then there is the question if the manufacturer in this instance didn't merely use an unkind, unfair and ungentlemanly excuse for refusing to give an applicant a job!

The Newport Timber Company of Newport, B.C., will shortly erect an extension to their mill in that town. The company expects to double their capacity.

305 Fast Feed Molder, manufactured by the Fay & Egan Company

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

WANTED—A quantity of 4/4-in. Ontario Plain Red Oak, vicinity of Georgian Bay preferred. Apply Box 535, Canada Lumberman, Toronto, Ont. 14-17

White and Red Pine Wanted

3 in. x 6-in-7-in. 18 ft. Tank Stock, also Quarter Cut White Pine Pump Squares.

Ontario Wind Engine & Pump Co., Ltd.
Toronto, Ont. t.t.

Basswood Lumber

We will purchase Basswood Lumber, 1-in. and 1¼-in. thick, white stock by car or entire stock. White us what you have and what you want for it.

Box 498, Canada Lumberman, Toronto, Ont. 11-15

Basswood Lumber Wanted

We will purchase Basswood Lumber, 1 in., 1¼ in., 1½ in., 2 in. thick. Write us what you have and what you want for it.

CANADA LUMBER SALES CO.,
N. B. 416,
Dominion Express Bldg., Montreal.

Trimmer Ends Wanted

Price and freight rate permitting we will contract to take your White Pine Trimmer Ends, rotten pieces thrown out, fresh stock and not colored. Write price per cord on car and state shipping point.

The Wm. Cane & Sons Company, Ltd.,
11-17 Newmarket, Ont.

Birch Wanted

Want 200 M. ft. 10/4 1st and 2nds and No. 1 Common Birch. Give average widths and lengths and percentage of 14 and 16 ft. lengths. Want price delivered Philadelphia, Pa. and New York City.

Want 200 M. ft. 6/4 No. 1 Common Birch delivered Boston, Mass.

Want 5 cars 4½ in. and 5 in. 1sts and 2nds. Birch delivered New York City and Philadelphia, Pa. Reply Box 526 Canada Lumberman, Toronto, Ont. 14 T.F.

FOR SALE—LUMBER, ETC.

For Sale

To the manufacturers: Birch, Maple, Basswood and Elm in all thicknesses. Send us your enquiry. The Meaford Lumber Company, Meaford, Ont. 7-20

For Sale

100 M. ft. 2-in. Cull Spruce. 300 M. ft. 1-in. Cull Spruce. 15 M. ft. 1¼-in. M. C. White Pine. 50 M. ft. 2-in. M. C. White Pine. Fred T. Smith, 310 Board of Trade Bldg., Montreal, Que. 1.t.f.

For Sale

500,000 feet Band Sawn Birch 4/4, 5/4 and 8/4 in shipping condition, rail or water shipment The Rathbun Company, Deseronto, Ont. 14-1

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co., Ltd., Toronto, Ont. 7-tf

Lumber For Sale

4 cars 1-in. good cedar for boat building.
100,000 ft. 2 x 6 mill run hemlock.
100,000 ft. 2 x 8 mill run hemlock.
4 cars 2-in. white oak, sound and square edge. Apply to Geo. C. Goodfellow.
Montreal, Que.

Shingles For Sale

for immediate shipment. Standard grades.
7 cars Specials.
5 cars Extra No. 1 with clear whites in.
5 cars Clear Whites.
Which we bought before the raise and can sell under the market, write or wire for prices for immediate shipment. 14-15

KEDDY & KENNY,
Hemmingford, Que.

For Sale

For quick shipment, 800,000 ft. Birch. All grades and thicknesses.
200,000 ft. Soft Elm M. R. All thicknesses.
100,000 ft. Basswood M. R. inch.
100,000 ft. Maple. All grades and thicknesses.
Send us enquiries. The Meaford Lumber Company. 7-20

WANTED—MACHINERY, ETC.

WANTED—Good second hand Wickes gang, 18-in. cut; must be of modern construction and in good operating condition. Advise with full particulars. Graves, Bigwood & Co., Buffalo, N.Y. 13 T.F.

Wanted Sawmill

Portable Sawmill with capacity of about eight thousand feet. Must be in first-class condition. Write all particulars to C. A. Spencer, Eastern Townships Bank Building, Montreal, Que. 14

FOR SALE—MACHINERY, ETC.

For Sale

Planing mill, sash and door factory. Well equipped. Doing good business in a city of twenty thousand. Good reason for selling. Address Box 524, Canada Lumberman, Toronto, Ont. 14

Belting For Sale

1,000,000 ft., all makes and sizes. Pulleys, Shafting, Saws, Iron Pipe, Roofing, Steel Cables, 200 tons Relaying rails, etc. Write us for prices, stating requirements.

Imperial Waste Metal Company,
11-14 150 Queen Street, Montreal.

Machinery For Sale

A Waterous No. 4 Band Saw Mill, with Carriage Saws, Live Rolls, and complete Filing Room equipment, also several Good Woodworking Machines, in splendid condition.

J. S. FINDLAY,
2-TF Owen Sound, Ont.

Thresher For Sale

For sale or exchange on standing timber, Waterloo Champion thresher with or without straw cutting attachment, wind stacker, feeder, chaff blower. Thoroughly re-built; guaranteed. Address Angus Bowman, New Dundee, Ont. 14

For Sale

Sawmill, in good condition, on Burford Lake, six miles from Wiarton, equipped with 70 H. P. boiler, 60 H.P. engine, new carriage by Long Bros., Orillia, Ont., good trimmers and endless chain attachment for hauling logs out of water.

Terms, etc., apply Massey-Harris Company, Toronto. 4-T.F.

For Sale

Two Steam Logging Engines by Alex. Dunbar & Sons. John Breakey Registered, Breakeyville, P.Q. 14-15

Saw Mill For Sale

On Georgian Bay, adjacent to North Shore, good two-storey circular mill in good running condition, double edger, trimmers, capacity about 12,000 feet per day; plenty timber available and ready sale for slabs; splendid opportunity for small millman; will be sold cheap as owners have other interests requiring their attention. Box 444, Canada Lumberman, Toronto, Ont. 5-TF

Logging Equipment For Sale

100 Russell logging cars, complete with all chains, brakes, etc., in strictly first class condition at exceptionally low price. Full outfit of logging equipment, horses, harness, sleighs, chains, tools, blankets and camp outfit, all at a small fraction of its value. Write for prices and full description to Yawkey-Bissell Lumber Co., Arbor Vitae, Wis. 14-17

Machinery For Sale

One 10-in. moulder on base Hespeler Machinery Co.; one 26-in. divided roll Ballantine Planer; one power feed rip saw Ballantine; one 16-in. buzz planer with Jones guard; one 30-in. bracket band saw; one shaper; one roll top cut-off saw; one wood frame cut-off saw and groover with two patented groover heads; one wood frame rip saw with boring attachment; one mortiser; one tennoner; one sash and door sticker with five heads; one door clamp; one 16-in. swing lathe; one sand drum; one 30-in. x 30-in. x 36-in. safe; one 35 h.p. engine and boiler; one emery with three wheels; one swing saw; a large quantity of sprocket wheels and chains; one automatic saw gummer; twelve roller bearing factory trucks; one rope feed saw mill; large number of wood split pulleys; quantity of used belting; quantity of shafting hangers, boxings, etc. Will sell any of the above cheap for quick sale.

Write to Box 576, Canada Lumberman, Toronto, Ont. 12-tf

Machinery For Sale

Carver, four spindle, Rohlman.
Cut-off saw, railway.
Dovetailer, Boults.
Engines and boilers.
Jointer, chair seat, Jenkins.
Jointer, 16-in. Clement.
Moulder, two side, 6-in. Smith.
Moulder, three side, 6-in. Smith.
Moulder, four side, 6-in. Houston.
Moulder, four side, 9-in. Fay.
Moulder, inside, four side, 12-in. Woods.
Mortiser, Smith.
Mortiser, Bit.
Planer, 20-in. Gem.
Planer, 24-in. Cincinnati.

WANTED—EMPLOYMENT

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

WANTED—Position as Bookkeeper and office manager with wholesale lumber firm. Ten years' experience; competent to handle all of a lumber office work. Best of references furnished. Apply Box 521, Canada Lumberman and Woodworker, Toronto, Ont. 13-16

WANTED—EMPLOYEES

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

WANTED—Lumber Salesman, by American Hardwood Firm. State experience, and salary expected. Man with white pine experience preferred. Address Box 536 Canada Lumberman, Toronto, Ont. 14

WANTED—Yard foreman for retail lumber yard furnishing contractors, in South Western Ontario. Must be active man, not afraid of work. Wages to start $2.50 per day, with a possible raise to $18 per week. State age and experience. Box 520, Canada Lumberman, Toronto, Ont. 13

Wanted

Thoroughly competent saw filer for mahogany and hardwood mill, experienced man for slicing and rotary veneer machines.

Circular sawer for edger.

Apply 119 Board of Trade Bldg., Montreal, Que.

Reporter

We want an energetic representative in each town in Canada to report on building and engineering work—to tell us where machinery, equipment, supplies or materials may be sold. Reports are paid for on the per item basis. It depends upon your own efforts how much you make. This is a profitable side line and there is good money in it for a hustler. Write to MacLean Daily Reports Limited, 220 King Street West, Toronto.

BUSINESS OPPORTUNITIES

For Sale

Planing mill, well equipped with modern machinery, doing good business. Ill health only reason for selling. Reply J. S. Richardson, Tillbury, Ont. 12-15

Timber Limit For Sale

1,200 acres Hardwood, Hemlock and Cedar. Some Pine; 9 million feet for $5,000 cash. Five miles from railroad; two from river. Box 431, Canada Lumberman, Toronto, Ont. 6-t.f.

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

Tenders for Pulpwood Limit

Tenders will be received by the undersigned up to and including the 15th day of August next, for the right to cut pulpwood on a certain area, situated on the Abitibi Lakes and River, tributary to the Grand Trunk Pacific Railway, and the Temiskaming and Northern Ontario Railway, in the District of Temiskaming.

Tenderers shall state the amount they are prepared to pay as a bonus in addition to dues of 40 cents per cord for spruce, and 20 cents per cord for other pulpwoods, or such other rates as may be from time to time be fixed by the Lieutenant-Governor in Council, for the right to operate a pulp mill and a paper mill on or near the area referred to.

Such tenderers shall be required to erect a mill or mills on or near the territory and to manufacture the wood into pulp and paper in the Province of Ontario—the paper mill to be erected when directed by the Minister of Lands, Forests and Mines.

Parties making tender will be required to deposit with their tender a marked cheque payable to the Honorable the Treasurer of the Province of Ontario for ten per cent. of the amount of their tender, to be forfeited in the event of their not entering into agreement to carry out conditions, etc.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

W. H. HEARST,
Minister of Lands, Forests and Mines.
Toronto, Ont., May 15th, 1912. 11-15

For Sale

The best equipped planing mill in Northern Ontario in fast growing town. Also lumber yard in connection. Splendid opportunity for live man with some capital. Owner retiring from business. Apply Box 522, Canada Lumberman, Toronto, Ont.

For Sale

Established Lumber Business, with first-class mill, now running full time. Timber limits with 20 to 30 million feet of standing pine timber conveniently located, and all merchandise, etc. Price $55,000. This is worthy of investigation. Address Box 332, Canada Lumberman, Toronto, Ont. 19-22-t.f.

Timber Limits For Sale

Two sections, 1,280 acres timber, about fifty miles from Nelson, B. C., one mile from railway; about 12,000,000 feet saw timber, 5,000 to 6,000 poles, and considerable tie timber. Road from railway to limits. Must be sold immediately. Offered at great sacrifice. Apply J. R. McDougall, Trail, B. C. 13

Woods for Pattern Making

Some interesting data concerning the relative merits of the different woods employed for pattern making purposes has resulted from investigations at several large American pattern shops. These go to show that the woods chiefly used are white pine, cherry, and mahogany. White pine has always been used primarily in the manufacture of patterns, and still furnishes the principal supply of material for this purpose. Owing to the high price of No. 1 shop and better white pine, which are the grades employed for pattern-making, California sugar pine is substituted to a considerable extent in many shops where large castings are made. Sugar pine is regarded as the best substitute there is for white pine, but it is not as satisfactory for the reason that the tiny "sugar streaks" in this wood are prone to ooze resin even through the varnish finish, which often results in a rough casting. While both white pine and sugar pine are inferior to cherry and mahogany, their lower price makes them more generally employed for pattern making purposes. It has been estimated that patterns made in cherry and mahogany can be used several thousand times, whereas a soft-wood pattern would endure only about one-quarter as long a period. Constant use will gradually wear off the sharp edges that are all-important in the forming of an accurate mould. When this occurs the usual remedy is to chamfer down the blunted corners and set in duplicates of cherry or mahogany. In core boxes, it is a common practice to glue a hardwood veneer over the pine. Only small or delicate patterns that are liable to be subjected to unusual wear are always made of hardwoods. The larger patterns, such as gear wheels, have their teeth made of hardwood, and the frame work of pine. Generally speaking any wood that tends to either shrink or swell is poor material for pattern making. Experience has shown that pine will shrink considerably in width, and will also expand materially when placed in contact with the moist core sand. Considerable quantities of the three woods mentioned are utilized each year by big pattern concerns. As an instance of the extent of consumption one factory alone consumes each year 175,000 ft. of pine and 1,500 feet respectively of mahogany and cherry.

The Tool Room in Sawmills

In these days all up-to-date mills recognize the value of a fully equipped tool room placed in the hands of a really competent man, who is made answerable for the proper equipment and perfect working condition of all cutting tools; and there is no doubt when this plan is properly carried out the result is a larger output of better quality, with a considerable saving in power and time. It cannot be too frequently urged that the tool room is really the most important department in a mill, and any reasonable outlay in this connection is soon amply repaid. In addition to a full equipment of tools for repairs, it will be found to effect a considerable saving in time and pay well in the end to provide each machine with a duplicate set of saws, cutters or chisels, as the case may be. In this case each machine should be numbered and have a peg rack or small cupboard to itself in the tool room, and as the saw becomes dull all the operator has to do is to take it to the tool room for re-sharpening, and obtain a fresh saw from his peg, thus practically saving a large amount of stoppages of the machines.

The equipment will naturally depend on the machines in use, but all circular, frame, band saws and plane irons will give a much better result if sharpened automatically, as all teeth and angles are thus produced alike, and each will take its fair share of work—a result that is quite unattainable by ordinary machine or hand sharpening, no matter how skilled the operator may be. Our advice, therefore, to all saw millers is to look well after the tool room, which someone has very justly termed "the heart of the mill."

Working "Stuck" Screws

When it is necessary to move a planer or some other machine bed a considerable distance up or down, more than it has been accustomed to moving, the screws invariably stick and refuse to pass through the nuts, says M. C R. in Wood Craft. This is on account of the accumulation of grease and dust upon the screws and possibly in the nuts. In fact, the screws are then actually "rust-stuck" with sawdust.

Almost any screw when in the above condition will yield to the following treatment: Turn the screw ahead a turn, or a half a turn, as convenient, then, with almost the same motion of the wrist, give the screw a return pull, at the same time turning it backward an eighth or a quarter of a turn. Sometimes, a couple of turns can be made ahead, and a quarter backward will start the coating on the screw. In other cases, not more than an eighth of a turn can be made ahead, and nearly as much movement backwar has to be made to start the coating on the screw.

But, whatever movement is possible, keep it up and eventually the screw will be worked through the nut the required distance. Another very good, though sometimes seldom used method, is to go over the screws in all the machines once in three or six months and clean them thoroughly, also keep them lubricated with graphite and vaseline or some other thick oil. This method is better than the first, and effectually prevents the screws from wearing thin in some places while the threads are of the original thickness in other and the least used portions of the screw.

Grinding Knives on the Head

The idea of grinding planer knives on the head where they run, to insure absolute accuracy of the several cutting edges, is not new, but is now before us in new form. The amount of grinding to be done has been reduced to a minimum by the use of thin steel knives, so that to-day the grinding of a set of knives is a light, short job that can perhaps be done in less time than it formerly required to adjust a set in the machine after grinding. Grinding on the machine was the next natural step after jointing on the machine, and it simply had to come. That it is here now we have but to take notice of the machinery advertising pages to get evidence, and that it will stay, to the extent of grinding on the head—either in or out of the machine—there is not much question, so long as the present tendency in planer practice holds. Some day some one may develop a new and radical departure that will change the trend, but that will be another story. At present the ultra-modern idea is to not only joint knives on the head, but to also grind them there to the jointing.

Measure Your Lumber With the Barkey Lumber Register

The most accurate measure on the market.
Can be instantly adjusted.
Capacity 60,000 feet.
Measures any width and length.
Can be used on any moulding or matching machine.
Will work backward as well as forward, and will not slip on smooth or icy boards.

SENT ON 30 DAYS' TRIAL. RETURN AT OUR EXPENSE IF NOT SATISFACTORY.

Review of Current Trade Conditions

Ontario

The present conditions of the lumber trade throughout Ontario is creating a spirit of optimism among both wholesalers and retailers. Large stocks as a whole are not obtainable, but still, outside of hemlock there seems to be enough to meet the demand, which is heavy. Prices on the whole are well maintained, and if anything there is a tendency for an advance. Hemlock, particularly dry stock, is becoming very scarce. There is a heavy demand for this grade, owing to the large amount of building going on, and retailers state that they cannot buy dry stock of any kind. Wholesalers in general, also state that the market is pretty well cleaned up. Prices have advanced during the past two weeks in practically all grades, anywhere from 50c. to $2.00 per M. 1 x 4 and 5, 9 to 16 No. 1 is now worth $16.50. 1 x 6, 9 to 16 $19.50, and 1 x 10 and 12, 9 to 16 $19.00. No. 2 both inch and two inch has gone up $2.50 per M., while 2 x 4 to 12 and up to 18 and 20 feet has also had an advance about $1.00 per M. In No. 2, 2 inch and 4 inches and up in width, 6 to 16 feet, quoted at $13.50 in our last issue is now worth $15.50. It will be seen from these figures that hemlock, on the whole, is worth upwards of $2.00 per M. more than the topprice last year. This season's cut is beginning to arrive, and it is thought that this will have a tendency to relieve the present market conditions to some extent, although contractors and others are rather pessimistic, as they state that their specifications for buildings on which they are working, all call for dry stock.

The mills are reported working overtime to catch up with the shortage, but it does not look from the present demand as if they will accomplish anything to this end until the season is practically over.

Hardwoods remain about the same, with the exception of birch and the lower grades of elm and basswoods. The demand is good in all lines, and prices remain firm. Birch is particularly scarce and dry stock cannot be had under any consideration. A well known wholesaler when asked about market conditions regarding birch, said that the demand was far greater than the supply and that he did not know what the furniture and implement manufacturers, and others who use this wood extensively, would do for winter stock. The Ontario and Quebec cut have been practically disposed of, owing to the abnormal demands. American wholesale manufacturers are sending numerous enquiries for Canadian birch, but practically all their enquiries are being turned down, as the Canadian mills cannot even supply the local demands. Cull elm and basswood are also on the rise. This is thought to be due to the scarcity of hemlock and pine culls, which are used by the box factories for crating purposes. These culls are being called for continually and as they are none too plentiful, a further advance is looked for. Oak is in good demand and prices remain steady. Maple, which is used extensively by implement and furniture manufacturers, is also hard to get. Last year's cut of this lumber was small, and in consequence this year's heavy demand has depleted the market, although prices have not advanced to any considerable extent. Lath and shingles also have a fair market. XX B. C. shingles are now worth $2.30, a drop of 10c. on the last figures quoted. Stocks are coming in a little faster than they did a couple of weeks ago and wholesalers and retailers report good demands at fair prices, and a likelihood of a further demand in the near future.

The millmen, wholesalers and others throughout Ontario who are moving stocks to any considerable extent, are complaining about the continued car shortage. In some localities, particularly where the railroad companies have extensive railroad yards, cars are plentiful, but in other districts, notably the Ottawa Valley and the north-eastern part of Ontario, cars cannot be had. The railway companies are coming in for many scathing remarks on account of this shortage, but they say they are doing all in their power to relieve the present conjestion, but that they cannot do very much, owing to the great demand made upon them this year by the manufacturers, which was totally unexpected. The crop this year in the west promises to be an abundant one and from the present outlook the railroad companies will have considerable difficulties handling the large amount of grain which will need to be transported to the east. Millmen, as a general rule, expect that the lumber trade will suffer considerably from shortage of cars when the railways start to move the grain crop.

It is stated that the Standard Chemical Company, of Manning Chambers, Toronto, contemplate erecting a large lumber mill and chemical works at McLeod, Alta., which will cost in the neighborhood of $1,000,000.

Eastern Canada

The best of business conditions exist at the present time in the east. Prices are if anything on the increase owing to the difficulty in securing stock. Dry stocks around the eastern States are scarce, although it is hoped that the new stock which will come on the market shortly, will have a tendency to relieve the present situation. The common grades are mostly in demand for building purposes and a large amount of building is being considerably retarded, owing to the scarcity of these grades. The Eastern States trade is very good with firm prices and an abnormal demand. Offerings are limited, however, and the mills are reported working overtime to accumulate stock. Spruce on the whole is fairly firm. The general demand is not so good as it has been, but fair enquiries are being made. Retailers throughout the east are not restocking their yards as they have done heretofore. No special reason is given for this beyond the fact that they cannot get the particular stocks they want, owing to the scarcity. Frames in Boston are commanding $25, but some sales are reported at $24.50. Hemlock is very much wanted in the east, but dry stocks cannot be had. Boards are in demand at good prices, $22.50 being the standard figure. Low grade stock for building purposes is wanted very badly in New York and Boston, as is also white pine.

The hardwood situation is good but prompt shipments are difficult to obtain. Wood work and furniture factories are working full time, but cannot replenish their stocks. Maple and birch are commanding fair prices and are in good demand. Practically all hard woods are at a firm price with offerings small. Lath and shingle prices are good, although the demand is normal. Extras are quoted in Boston at from $3.85 to $3.90 with some sales at $4. Exports to the old country, which have been affected by the dock strike, are again getting into normal shape. Vessels that have been tied up for a considerable time are arriving and stocks that have been waiting shipment will be shipped at once.

Lumbermen in eastern Canada are complaining a great deal about the car shortage. The Canadian railway companies at the present time cannot handle their ever-increasing business owing to lack of rolling stock. The different companies have large numbers of cars on order, but cannot get them owing to the inability of the car manufacturers to get stock. The C.P.R. car shops in Montreal are overloaded with orders as is also every other car shop in the eastern counties, and as the grain crop this year promises to be far in excess of any previous year lumbermen as a general rule are pessimistic as to the ability of the railway companies to handle both the grain crop and the lumber trade, which promises to be heavy.

Great Britain

The Dock Strike in England may be considered practically at an end, but business has not as yet assumed a normal condition. The London Docks, in fact the docks in all parts of the United Kingdom, are crowded with lumber at the present time, and inland dealers are complaining a great deal about deliveries. The English railway companies are coming in for a lot of criticism from English lumber firms, owing to their inability to deliver shipments. The strike, while it has crippled the railway operations to a great extent, is thought to be only a minor cause for the present congestion, and English dealers are pessimistic regarding the future movements of large stocks by the railway companies. Trade in London is fair; the prices, if anything, have increased, but the freight rates throughout the United Kingdom are very uncertain and for that reason all timber merchants, whether in London or in the country, are at all times apprehensive as to buying in the face of the numerous changes, although it is expected that the cessation of the labor troubles will have a bearing on this question. Deals are cheaper than they have been on one or two previous occasions by about 10s. per standard, prices on battens being specially well maintained. The pine market is still strong; prices are stiff with increased freight rates and a further rise is expected. At Liverpool, the spruce deal freight market still has an upward tendency; 56s. 3d. per standard is being paid for deliveries from New Brunswick and Nova Scotia, an increase of 1s. 3d. The spruce market is not any too good, the consumers generally contenting themselves with buying much smaller lines than usual. Taking the demand all around, it is fair but the building trade is not up to the expectations, although prospects are better.

The recent strike in the cabinet trade is seriously interfering with hardwood importations. Stocks on the whole are exceptionally low, lumber in the lower grades being short. Shipments as a rule are nearly all going direct from the quays into consumption. At Bristol the sudden cessation of the strike caught the timber importers rather unexpectedly, as they did not expect to resume operations

A FLEET OF TUGS BRINGING IN A RAFT CONTAINING SEVERAL MILLION FEET OF LOGS

DRY PINE LATH

Are you in the market for lath? We have a nice lot of No. 1---4 foot Dry Pine Lath on hand which we want to move quickly. Write or wire at once for quotations.

Of course we are never without a dry stock of Norway and White Pine Lumber. As our mills run the year round we are always noted for "having the goods."

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

for some time. Values are well maintained and stocks on the whole are in a fair shape. The upward tendency of the freight rates is being felt by the manufacturers and shippers, and f.o.b. operations will be considerably restricted as a result.

A further strike of the woodwork machinists association is expected at Hull, but it is not thought that this will inconvenience the manufacturers to any great extent. Chartering is slow, importers being naturally reluctant to give way to the ship owners' present freight demands, and this alone looks like bringing about a late season.

Conditions at Glasgow remain steady with if anything an increased demand. The recent price cutting has ceased to a great extent, and dealers have at the present time more confidence in the future of the market. Shipbuilding requirements continue good with every probability of becoming better in the near future. The furniture trade is active which makes the demand for hard woods very good. Plain oak boards in No. 1 Com. are in demand and are commanding a good price. Wagon builders' stocks are very scarce and prices in these lines are going up. Spruce is also somewhat scarce. It is being imported in small quantities and is easily disposed of on the quays at good figures. The boxmaking trade has improved considerably and a good season is expected.

United States

American trade conditions at the present time are very favorable in all lines, hemlock being particularly in demand. Dry stocks of this lumber are very scarce, and with the steady demand, the recent advance of 50 cents a thousand does not seem to have had any effect on the market to any extent, beyond apparently making it firmer. The general demand is good, stock being offered in limited quantities only. Enquiries are of larger volume, and reports indicate that mills are apparently on a somewhat more active basis. Hemlock boards are particularly scarce. Eastern dealers report a steady demand for them, but state they cannot obtain them under any consideration. Wholesale dealers report shipments coming in steadily and expect to have their stocks in good shape in the course of the next 60 days. So far prices have advanced this year $2 over the quotations of last season, the increase in prices made by the manufacturers in the West apparently having considerable influence with other dealers throughout the States. The pine market is about normal at the present time; the demand is fair and prices remain firm. California white and sugar pine being particularly in demand. Northern pine prices are strong and well maintained. The box factories are all busy and are buying up the lower grades in large quantities. The Western mills are running full time and reports state that they are cutting large stocks of pine for future use. Box lumber has been particularly in demand this season, the manufacturers stating that if anything, the supply has been short. A large amount of this material is being imported from Canada and is apparently giving satisfaction. Retail dealers throughout the States are not buying so readily as they did a few months ago. They are apparently waiting for crop reports and also the outcome of the impending elections. Building operations have been extensive with indications that they will remain so for some time. As a general rule, the market is good, with prices if anything showing a tendency to advance. In the Southern field the mills are working overtime, in some localities they are running a night and day shift, and this means that the volume of stock being turned out is large. Most of the mills are booked ahead with orders that will keep them going for the next 60 to 90 days, and it is thought that by the end of that time, general yard stocks will be in fairly good condition. Southern pine is in good demand, heavy timber and joists being particularly asked for. Car material finds an active market as does also sash and door stock. Prices on the whole remain about the same with little indication that there will be any change in the near future. Spruce is very scarce throughout the States. Offers are very limited and prices have advanced in some cases from 25 to 50 cents. Dry stocks are particularly hard to obtain with an extensive demand. Frames in Boston at the present time are commanding $25, the bulk of the business being done at this figure, although some sales are reported at $24.50. Random is very firm with a good demand, and boards are quoted about the same.

Red cedar shingles are very scarce at the present time throughout the States. The demand has increased abnormally during the past couple of weeks, and apparently the dealers have not been prepared for it. Prices are steady with a tendency to advance, stars being quoted at $2.51 and clears at $2.97 at Minneapolis, Minn., with an extensive demand at these figures. The fall trade it is thought, will be active with if anything a slight advance in prices.

Lath on the whole is in demand, the prices remaining about the same. 5/8 in. command $4 to $4.10 and for 1½ in., $3.65 to $3.80. Hemlock lath is particularly scarce, while spruce is none too plentiful. Most dealers are holding for outside prices, although as a rule the prices above quoted are standard.

Trade News and Notes

A number of papers pertaining to methods for preventing forest fires were read at a recent Conservation Conference held at Lansing, Mich., between Michigan foresters and timber owners. In these papers some good ideas were brought out which will be acted upon at a later date.

Buffalo lumbermen to the number of 100 held a picnic at Cascade Park, Erie County, New York, on June 18th last. The picnic is an annual affair held by the Buffalo lumbermen and was a marked success in every way. Twenty-two big touring cars carried the members from Buffalo to the park. Two baseball games were played, a description of which would cover many pages, some of the points of the games being very humorous. A big banquet at the "hall" on the grounds brought a very successful day's outing to a close. It was altogether a day that Buffalo lumbermen like to remember and like to repeat as often as possible.

The Pennsylvania Railroad Company are taking an active interest in the reforestation of Pennsylvania, having planted more than 4½ million trees in the past 10 years. This fact which was brought out in a recent report, shows on what extensive lines this railroad company has undertaken the conservation of the natural resources of the territory traversed by its lines. The company's nurseries which are located at Morrisville, Pa., are very extensive, over 500,000 trees being shipped from them during the past year. The company states that in all of the 14 different tracts that have been under conservative management, the fundamental object has been to improve the condition on the properties and leave them in a productive state. The rejuvenation of this otherwise worthless forest land will add not only to the ultimate forest wealth of the state but will improve the conditions as regards stream-flow and run-off.

The Mississippi yellow pine manufacturers are quite wrathy over the recent so-called 10-hour law enacted by the Mississippi legislature, and are at present trying to devise some plan looking to relief from its oppressive operations. The law strictly says that no man shall work more than 10 hours a day as a lumberman. The sawmill owners strictly object to this, as they state that at present they have one shift of 13 hours, whereas if they put on two shifts they would have to make the salary so low for 6½ hours that the men could not get a living wage. Interesting developments are expected before this matter is thrashed out.

The reforestation and conservation of the forests adjacent to the city of Peterborough, Canada, was minutely dealt with by Professor Fernow, the well known Government expert on such matters before the Peterborough County Council last week, and as a direct result of the Professor's lecture the council appointed a committee on reforestation, who will investigate conditions and report at a later date. Professor Fernow said that the county was admirably equipped with rivers and lakes to supply water power for the carrying on of the lumbering industry so that this power might be utilized. He also urged a more efficient system of fire ranging.

Mr. George Busk Crow, well known to the lumber trade of New Brunswick and Nova Scotia, died at his home at Rockferry, Cheshire, England, on June 15th last. Mr. Crow was a Canadian by birth having been born at Pictou, Nova Scotia, in 1822. Upwards of 50 years ago, Mr. Crow established himself in Liverpool, England, as a lumber merchant and ship owner, dealing principally with the eastern Canadian provinces and Gulf of Mexico ports. He was a member of Mersey Docks and Harbor Board and also very prominently connected with the Congregational Church of England. His wife, who was Miss Jane Lawson, a niece of the late Sir William Lawson, died a few years ago.

At a recent meeting of the directors of the Canadian Forestry Association, the following resolution was recorded. That the Board of Directors of the Canadian Forestry Association place on record their approval of the proposal that at the earliest practicable date a regulation be brought into force compelling the use by railways of oil burning locomotives in dangerous districts and during dry seasons. A copy of the resolution was sent to the Board of Railway Commissioners of Canada, at Ottawa.

Canada's exports of printing paper in the month of 1912 show a marked increase over April of 1911. The exports total in value $259,736 made up of different classes of paper, the United States taking 2,514,483 lbs. of Canadian rags.

The president of the Dominion Steel Corporation at the recent annual meeting held in Montreal announced that that company had purchased timber limits and a sawmill at Dalhousie, N.B., in order that it might be assured of a sufficient supply of mine timbers.

A landslide which occurred at St. Luc on the River Champlain, Quebec, blocked the river for 300 yards, causing the water to rise 23 feet and wipe out Fugeres' sawmill, together with yards and boom.

Building Returns for the Half-Year

Twenty-Seven Cities Expended Nearly Seventy Million Dollars —A Proportionate Increase of 28 per cent. for the Dominion

Official returns submitted to the Canada Lumberman by twenty-seven leading cities of the Dominion, show an expenditure on building for the first six months of 1912, of nearly seventy millions, compared with some fifty-four millions for the corresponding period of 1911—a proportionate increase of 28 per cent. It is of interest to note upon reference to last year's returns that the total for the whole of 1911 was roughly $120,000,000—an increase of 29 per cent. over the year's total for 1910; so that the increase of 28 per cent. for the first six months of the current year, as shown in the accompanying table, is an indication, in general, of the proportionate and healthy growth of the whole country, and in particular, of the gratifying activity in constructional circles. Such records as these are peculiarly significant to the lumber industry.

Toronto maintains her position at the head of the list with an expenditure of thirteen millions and a lead of two millions over Winnipeg and five millions over Vancouver and Montreal, which follow in the order named. Edmonton, with an expenditure of nearly eight million dollars and the remarkable gain of 376 per cent., makes the most notable achievement. A great deal of attention is being focussed upon the Alberta capital from the other side of the border and it is fair to presage continuous activity for this city. The reputation of the province of Saskatchewan is upheld by Saskatoon, which records an outlay approaching five million dollars and an increase of 80 per cent. The Ambitious City makes a gain of 40 per cent., the City of Cyclones, 15 per cent., and the Federal Capital 52 per cent. Fort William occupies the tenth position in the list with a noteworthy gain of 132 per cent. Decreases occur in the case of only two of the larger cities.

City	June, 1912	June, 1911	1st 6 mos., 1912	1st 6 mos., 1911	Approx. inc. % for 6 mos.

Proportionate increase for 1912 on half-year totals for above cities 28 per cent. *Decrease.

The season of forest fires is again with us and it behooves every lumberman and owner of standing timber to take the necessary precautions to protect his yards and limits. During the past two weeks a number of large yards situated in Ontario and western provinces have been destroyed, besides an immense amount of railway material in the vicinity of Cochrane on the north shores of Lake Superior, where forest fires have been raging for the past week. Canadian standing timber of all kinds is becoming scarcer year by year, and every lumberman who has the interests of the Canadian lumber trade at heart should bestir himself and do all in his power to see that his employees do all in their power to prevent these annual conflagrations. The railroads as a rule are the greatest source of danger. Sparks are a great factor in starting forest fires, and the rigid enforcement of a law compelling the use of spark and cinder arresters should be seen to at once. A fire patrol along the tracks would also be of great assistance. Settlers and campers are also careless in regard to fires in a great many instances. Settlers start fires to clear their lands and campers carelessly leave fires smouldering—all of which is a constant source of danger. Rangers have great difficulty in keeping track of campers, settlers and prospectors, etc., who go through their districts and as a rule cannot get in touch with them. The Government or railway company should publish a list of the rules governing fires, etc., in the bush, and distribute them to the large number of campers who go north for the summer and fall to fish and hunt. The co-operation of the lumbermen of the country would help materially along this line.

Shimer Cutter Heads and Cutters!

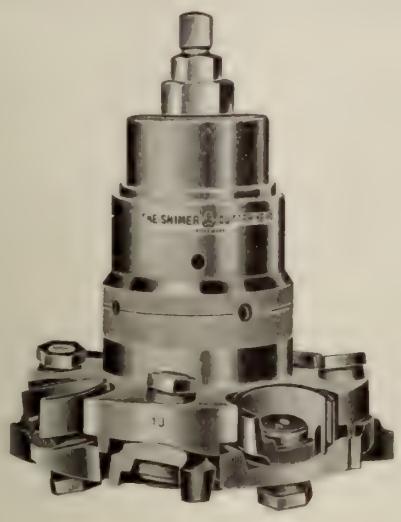

Fig. 627

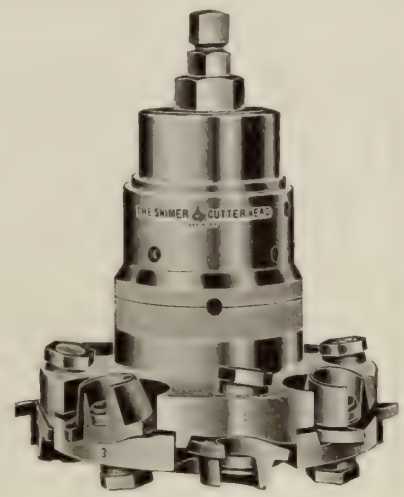

Fig. 628

The "Shimer Limited" with Expansion, price $72.46 per set, complete

The Ultimate Cost

of your Cutter Heads is the thing to be considered: that is the sum of the first cost plus the cost of maintenance. Sometimes the Ultimate Cost of a tool is twice or many times the first cost. Just when that time will come depends upon its wearing power or its liability to break and cause damage.

"Quality" has always been a special feature in Shimer Cutter Head construction and has been the means of keeping down the cost of maintenance. This quality feature of the Shimer Cutter Heads has been growing with the variety of tools put upon the market, until almost invariably wherever the name Cutter Head is mentioned the mill man is sure to think of the **Shimer** Cutter Head.

These tools are made for many varieties of work. For matching Flooring, Ceiling, Wainscoting, etc., they are made to suit machines from the slowest to those taking stock 150 to 170 lineal feet per minute, and are sold from prices ranging from $26.00 per set for Figs. 1 and 2 to $72.46 for our Shimer Limited Cutter Head made especially for the fast feed matcher.

For any work you get out in quantity we can furnish tools that will save the "make-ready" time, lessen the amount of material going into the offal pile and turn out a quality product at a saving that will soon pay for the tools.

Let us know your Cutter Head conditions. We are sure we can serve you acceptably, as we have so many others, in making either regular or special tools for your particular work.

Write us now!

Popular Cutter Heads

The most popular of The Shimer Cutter Heads are Figs. 202 and 203. The Bits are held within conical duplex bit seats, self-centering, arranged with the very complete Expansion feature for the fine adjustment of tongue and groove thicknesses.

Price with 4 bits to each head, the set $40.95
Price with 6 bits to each head, the set 49.27
Price with 8 bits to each head, the set 57.60

Complete with Flooring Bits. The Heads will also receive Bits for thin Ceiling—⅜ at $1.30 each and Bits for 2-in. thick plank at $1.63 each.

Jointer Heads

For jointing plain edges we make several styles of Jointer Heads provided with shearing effect to produce the easiest and at the same time the smoothest work. Made of Steel Forgings they supply the strongest and best. Our very reasonable prices put the tools within the reach of all.

Price, with 4 bits to each head, the set, 1¼-in. $31.20
Price, with 4 bits to each head, the set, 2-in. 33.28

Ship Lap Heads

to give you the best service must be of a kind that is always ready and in interchange with matcher and other Heads you may have fitted to your machine, thus avoiding a change of machine guides. This is one reason why the Shimer Ship Lap Heads are so generally used. The other reason is that they do work so satisfactorily that all who know their convenience take them in preference to others.

Price, with 4 bits to each head, the set, 1½-in. thick, $34.84
Price, with 4 bits to each head, the set, 2½-in. thick 35.88

Double Ceiling Heads

These heads have a special design to suit the purpose of double tonguing and grooving, with overlapping of the bit cutting edges to produce perfect clearance and to protect the leading points from unnecessary friction and wear.

They double the capacity of any matcher or moulder and provide a means of turning out single surfaced ceiling or flooring upon the most economical basis.

Price, Double Ceiling Heads complete with Bits, net, $40.94

Door, Sash and Coping Tools

That save all the hand fitting. No changing of patterns, therefore, no trouble in framing the door and sash parts when they are matched up with the Shimer Cutter Head. We relieve you of that detail of the business when we place the mould in counterpart within the contour of the Bits. The Bits are filed only to sharpen and being set by means of a gauge give accurate and uniform results. Prices very reasonable.

Reversible and One Way Cutters

The Shimer Reversible Cutters for Single Spindle Shapers, Variety Moulders or Friezers, are carefully moulded opposite to the shape of the mould to be produced, in such a way as to have only the cutting edge touch the lumber. They are complete—inexpensive—time saving. We also make One-Way Cutters for the Double Spindle Shaper.

Thin Steel Knives

Advanced ideas referring to the planing and surfacing of lumber have developed into the use of the thin blades, made from high speed steel, which when properly tempered and treated, serve for one or two days of work on hard maple, oak or hickory.

These blades are known as our Bedee Knives and are recommended by users as the best that can be procured. For the benefit of those desiring to use this style of a knife we have facilities to furnish them in any length or thickness.

Write us about your requirements.

EDGINGS

Ontario

Serious forest fires are reported from the Porcupine district.

J. B. Lyle's sawmills at Smith Falls, Ont., suffered a small loss by fire recently.

Fire did upwards of $1000 damage in the lumber yards of W. J. Trick, Oshawa, on July 1st last.

The Superior Match Company will erect a factory at Owen Sound, Ont., in the course of the next year.

A fire at Neely's mill at Thornlaw, Ont., destroyed 550,000 ft. of lumber, and 30,000 ft. of saw logs a few days ago. No cause can be assigned as to the origin of the fire.

The partnership existing between Messrs. Parker & North, Winnipeg, Man., has been dissolved. This firm dealt in builders supplies, and was well known throughout the west.

A firm to be known as Clyde Limited with a capital of $40,000 has been incorporated and will locate in Lanark, Ont. The company will deal in lumber, timber limits and timber, and will start business at once.

A new firm has just been announced at Cobalt, in the Northern Lumber Mills Limited, with a capital of $40,000. This company will carry on business as lumber dealers, sawmill owners and general merchants. The head office is at North Cobalt.

R. E. Moore of Lions Head, a prominent lumberman of Ontario, dropped dead while bowling on the green at Lions Head, Ont., on June 27th last. Mr. Moore conducted a sawmill at that place for a number of years and was very well known to the Ontario trade.

Several bush fires have been raging at the present time in the vicinity of Cochrane; the first of the fires broke out at Iroquois Falls, since when many others have occurred. There has been no rain for a considerable length of time which gives the fire added advantage.

A forest fire near Sheldrake, 40 miles north of Sault Ste. Marie, Ont., has destroyed nearly 500,000 ft. of high-grade white pine logs, valued at $750,000. The timber was the property of the Bartlette Lumber Company. The fire is attributed to sparks from a locomotive.

The sawmills of the William Laking Lumber Company at Haliburton were burned to the ground on the morning of July 1st. The loss is estimated at from $20,000 to $25,000, with but very little insurance. The lumber yard and adjacent properties were saved through the efforts of the employees of the mill.

The McKinney Co. Limited of Woodstock is a new concern that will deal in all kinds of lumber and building material. They are capitalized at $40,000 and the provisional directors are as follows: H. J. McCombe, contractor, Embro; A. J. Johnston, contractor, Woodstock; W. G. Runds, contractor, Woodstock.

James Graham, of Bates & Innes, Carleton Place, Ont., was drowned in the Mississippi River at that place on June 24th last. Mr. Graham was superintending the putting of stop logs in the dam when he made a false step and was carried away by the water before anything could be done for him. His body has not been recovered.

Forest fires near Superior Junction on the north shore of Lake Superior are reported to have done considerable damage. Several bridges along the line of the N.T.R. have been destroyed and thousands of ties have been burned. It is thought that construction work will be held back for some time as the contractors are said to have lost a large amount of supplies.

The Riordon Paper Company of Hawkesbury and Merritton, who also own four large sawmills and valuable timber land in Quebec, have announced a new bond issue of 6 per cent., first mortgage bonds. The company's holdings in Ontario are regarded as being very valuable. They consist largely of spruce limits on the Rouge River. Their earnings for 1912 are estimated at $300,000.

Work was started last Tuesday on the construction of the new $1,000,000 paper mill at Thorold, Ont. James Battle, Esq., turned the first sod. Work will be rushed on the plant, which is expected to be ready for business in the course of the next year. Among those present were Warren Curtis, Jr., President and General Manager of the Ontario Paper Company, and Mr. William Prack from Chicago.

The mills of the Rat Portage Lumber Company, Kenora, Ont., were destroyed by fire on June 30th last. The mills were valued at $100,000 and at the time of the fire were cutting on an average 100,000 feet per day. A new engine costing $10,000, a gang saw and two band saws had just been installed. 50,000 feet of lumber on the platforms, several box cars and a large ice house were also destroyed. The loss is covered by insurance. The mills will be rebuilt at once.

Eastern Canada

Forest fires near Halifax, N.S., caused some alarm a few days ago.

The sawmills of A. E. Grandall, Neperis, N.S., were burned to the ground a few days ago.

Weston & Little, lumbermen and contractors, have just been registered at East Angue, Que.

The Quebec & St. Maurice Industrial Company have taken over the lumber business of D. H. Pennington, at Lyster, Quebec.

Messrs. Gezen & Shluker have been registered at Montreal, Que. They will open a lumber yard in that city.

The Chouinard Collins Lumber Company Limited, located at St. Jerome de Metane, Que., have obtained a charter.

The wood working plant and sawmills of Dochmer Bros. at Westlahave near Bridgewater, N.S., was completely destroyed by fire on June 24th last. The loss will be at least $60,000, with no insurance. The mills were one of

the best in the province and equipped with the most modern machinery Dochmer Bros. started the mill 30 years ago and were crowded with orders from the maritime provinces at the time of the conflagration. The mills will be rebuilt at once.

A new sash and door factory has been started at East Angus avenue Messrs. Hopkins, West & Little are the proprietors

A small fire occurred in the lumber yard of Morin Freres, St. Lawrence and Chenier streets, Montreal, due to a transformer on one of the electric light poles catching fire, and communicating it to a pile of lumber

Damage to about $12,000 has been caused by a fire in the factory of the Starke Cooperage Company, King street, Montreal. The kilns on the third floor were completely destroyed

Damage estimated at between $10,000 and $15,000 was done a few days ago to the plant of the Starke Cooperage Company, King Street, Montreal, by a fire which broke out in the kilns on the third floor. The loss is covered by insurance.

The Richelieu Lumber Company, Limited, Montreal, have commenced to operate their mill at Bonaventure River, P.Q., recently purchased from the Doutre Laviguerir Company, Limited. The drive has been finished and the company expect to cut about five and a half million feet.

Jos. Bedard & Son, of Richmond, Que., have dissolved partnership. The firm deals in lumber and general builders' supplies. H. I. & H. F. Bedard will continue the business under the same name.

A corporation to be known as the Marysville General Stores, Limited, capitalized at $50,000, is at present applying for letters patent, re the taking over of the mercantile business of the Partington Pulp and Paper Company at Marysville, N.B.

La Compagnie d'Immeubles de St. Pie Limitee, with a capital of $100,000, was incorporated recently in Montreal. The company will deal in all kinds of building material and erect buildings, etc. They will have their head offices at St. Pie, Quebec.

The Franco Canadian Timber Company, Limited, a new concern with a capital of $3,500,000 in dollar shares has been registered in London, England. It is said that the company possesses valuable holdings in Canada, and that they will carry on the business of saw mill owners, timber and lumber merchants and pulp or paper manufacturers.

Western Canada

The Galvin Walston Lumber Company were burned out at Edenfort, near Battleford, Sask., on June 22nd. Their loss is estimated at $25,000.

Cushing Bros. planing mill at Regina, Sask., was completely destroyed by the cyclone that visited that city recently.

J. F. Winlaw's sawmill at Winlaw Siding, B. C., suffered severely from a fire that visited that section recently.

The planing mill of the British Canadian Lumber Company Limited, at Crescent Valley, B.C., was damaged by fire recently.

The yards of the Saskatoon Lumber Company, at Saskatoon, Sask., were visited by a fire recently. The loss was small.

The yards of the New Lumber Company, of Medicine Hat, Alta., were visited by a small fire a few days ago.

The Paulin Lumber Company of Nelson, B.C., will shortly erect a planing mill and sash and door factory on the new townsite at New Era.

A number of steamers and schooners are at present loading timber at British Columbia ports for Australia, England, South America and the Orient.

British Columbia lumber men are at the present time paying a great deal of attention to foreign shipments. The demand is good and prices are high.

The recent forest fires at Tete Jaune Cache, B.C., have done very little damage. The fire is said to have been a ground fire, meaning that it did not interfere with the timber to any great extent.

Thomas Rutherford, of Brown & Rutherford, Winnipeg, Man., who was very well known to the lumber trade in the west, died recently at his residence at Winnipeg.

Mr. H. R. McMillan, of the Forestry branch of the Department of the Interior at Ottawa, has been appointed chief forester by the province of British Columbia. Mr. McMillan is said to be one of the most brilliant students in forestry ever turned out by the Yale Forestry School.

It is reported that a tract of timber on Vancouver Island valued at one million dollars has been sold recently to the Great Northern Land and Stock Company Limited, of St. Paul, Minn. The company, it is said, will carry on extensive sawmill operations and will acquire other tracts from time to time.

William Alsip, Sr., President of the Alsip Tile and Lumber Company, Winnipeg, died suddenly on June 29th last. The late Mr. Alsip was 78 years of age and had been engaged in the brick and tile making industry practically all his life. He came to Winnipeg 13 years ago with his two sons and founded the present company.

The British barque, "Kinrosshire," with two million feet of lumber on board consigned to Wales, will leave Puget Sound shortly on her voyage. The "wind jammer" is taking out the largest sticks of timber that have ever left the sound. Some of the "toothpicks" measure nearly 3 ft. square and are over 70 ft. long. The lumber is being shipped by the Canadian Puget Sound Lumber Company.

A fierce forest fire has been raging during the past week in the mountain townsite of Laggan, Alta. The C.P.R. Hotel at Laggan, which has accommodation for 700 guests and cost half a million dollars was threatened for some time but was saved through the efforts of 400 fire fighters, who were rushed to the scene on flat cars from Calgary. The latest report states that the fire is slowly burning itself out.

It is expected that the British Columbia Timber and Trading Company, whose sawmills were burned recently at New Westminster, will locate at Port Mann. The present site in New Westminster is now considered to have become much too small for sawmill purposes, and is said to have been acquired by the C.N.R. The company has bought land in Port Mann to the value of $50,000 and it is expected that they will build there shortly.

The Barnhart Log Loader

has been in successful operation in all parts of the country for twenty years and never caused a complaint. We are now manufacturing a new Barnhart Loader known as **Model "12,"** which is specially designed for use in very heavy timber. This loader is built on the same lines as the old Barnhart Loader now known as Model "10" and which we still continue to manufacture. We are operating lumbermen, producing 200,000,000 feet of lumber per annum and we use the Barnhart Loader exclusively. Could we afford to do so if it were not the best? Write us for prices.

Goodyear Lumber Company, BUFFALO, N. Y.

Dry Mill Cull and Box Lumber Becoming Scarce

These grades are being rapidly picked up. We have still a nice stock of last season's cut.

White Pine *for the* **Wholesale Trade**

We advise you to write, wire, or 'phone without delay and get the benefit of our low prices.

When you buy a belt

WATERPROOF

What do you consider, First Cost or Service?

It isn't the purchase money that determines whether the belt is cheap or expensive,—
it is the service you get *out* of the belt after it is on the pulleys!
Remember this and get the belting which

Costs Less Per Day of Service

That belting is "AMPHIBIA" every time.
You *may* pay a little more purchase money per foot at the start,—but that's the *last.* The rest is pure satisfaction *and service* long after cheaper (first cost) belting is in the junk pile.

Don't fool yourself with a cheap belt —get "AMPHIBIA" which always costs less per day of service.

WATERPROOF

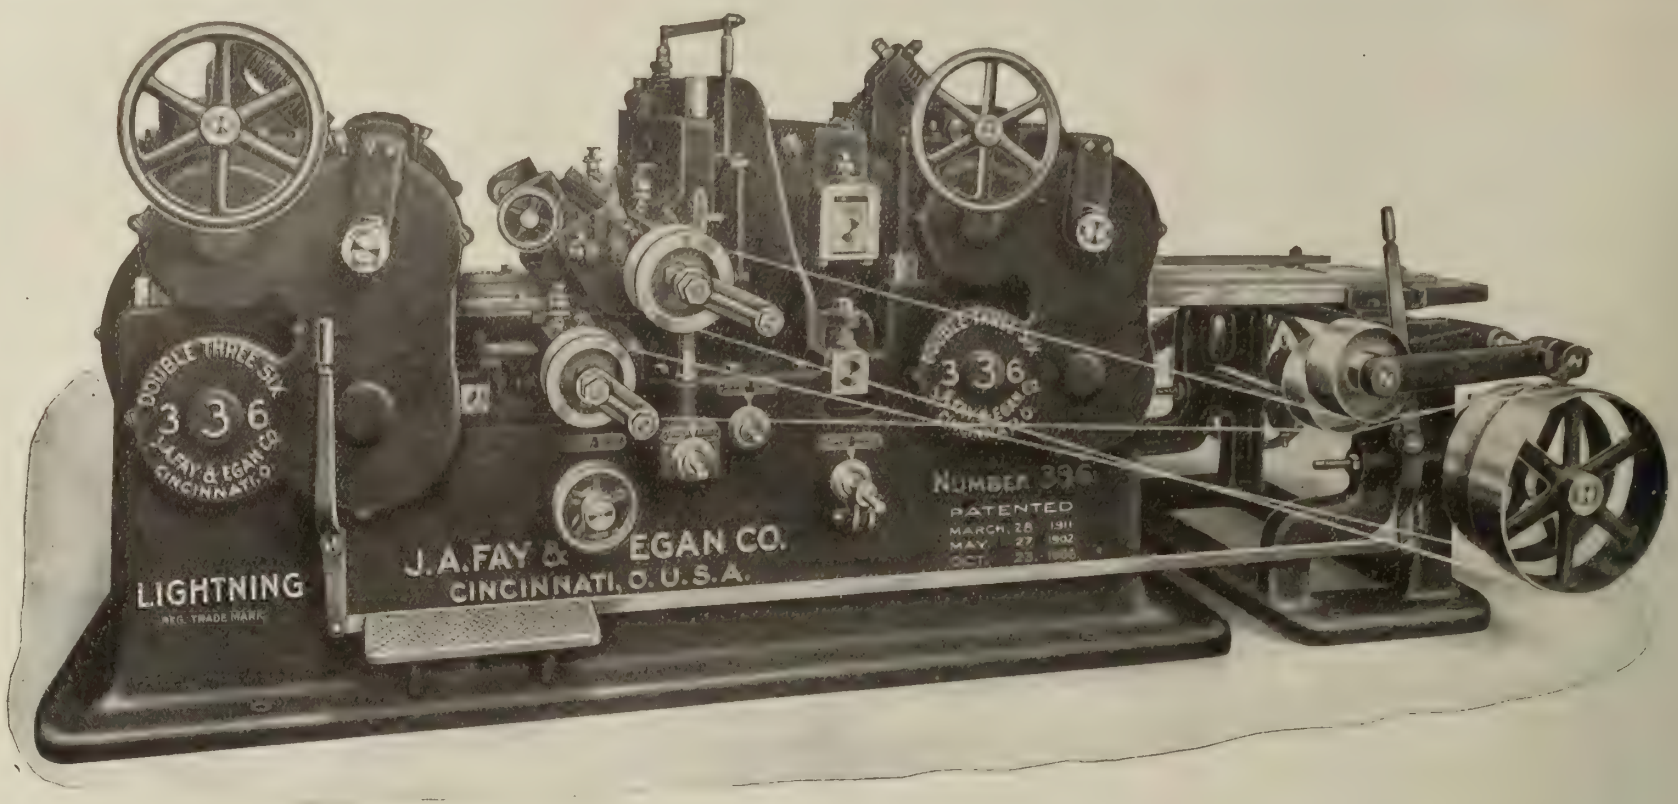
TO INSURE SATISFACTION—STATE WHERE BELT IS TO RUN



Here is the new Double Surfacer that is setting new marks for raising grades and lowering manufacturing costs—the FAY-EGAN "LIGHTNING" No. 336—

—without any "ifs" or "buts" we can unhesitatingly say that the new No. 336 with our patented round heads, thin air-hardened steel knives and jointing attachment will produce perfect surfaces on the most knotty and cross-grained stock at 200 or 250 feet per minute.

—this means that the same lumber you are now using will grade higher, or you can use a lower grade than you now buy and plane it up to what you are now getting.

—and the No. 336 will produce this higher grade stuff at a lower cost per thousand feet than has ever been done before.

—these are strong statements, we admit, but the 336 will back them up—you take no chances in putting one in—it is not an experiment—in the first place it is built on the same general lines as our No. 333 Matcher—now admitted to be ahead of any other—and in the second place the 336's have been in use long enough to prove themselves.

—we are enthusiastic about the 336 because we know what it will do—every owner of a 336 is enthusiastic, too, because he knows he is producing better lumber at a lower cost than his competitor without it—if you will investigate the 336 you will be equally enthusiastic.

Planing Mill and Box Factory Owners write today for large illustration and detailed description of the greatest surfacer ever made—the FAY-EGAN "LIGHTNING" No. 336.

World's Oldest and Largest Manufacturers of Woodworking Machinery.

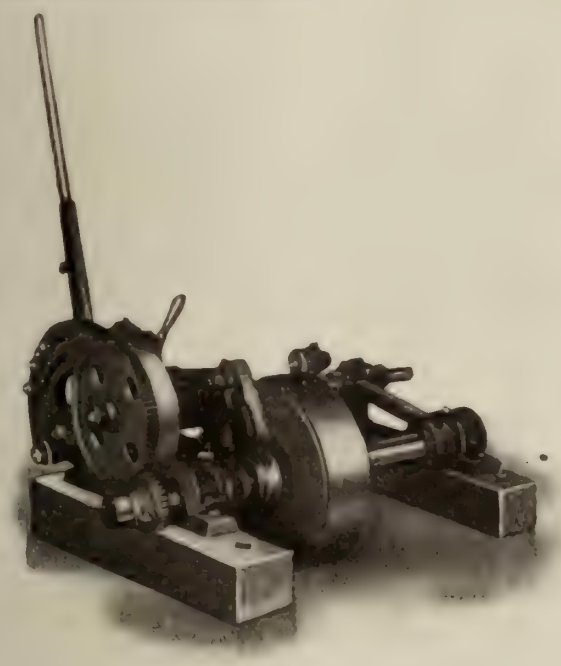
The Importance of Efficient Mill Machinery

In Millwork, where every portion of the equipment has to undergo the severest treatment with unusually hard conditions only the best machinery will serve. No mill can be run at a profit with inferior equipment. This is an expression of the opinion of men of wide and varied experience in the business.



P. Payette's Improved Mill Machinery, is built to stand all the strain and hard usage of mill work. This machinery is of the special Payette design and embodies many improvements, which add considerably to the efficiency of mill equipment.

The New Patent Saw Mill Dog which operates in soft or hardwood timber of any kind will do good even work in summer or winter with perfect safety.

Payette's Improved Set Works will set even thickness of lumber in all class of timber and will set any size log with perfect ease, Can be changed instantly so as to make either thick or thin lumber and can be put on any make of carriage.

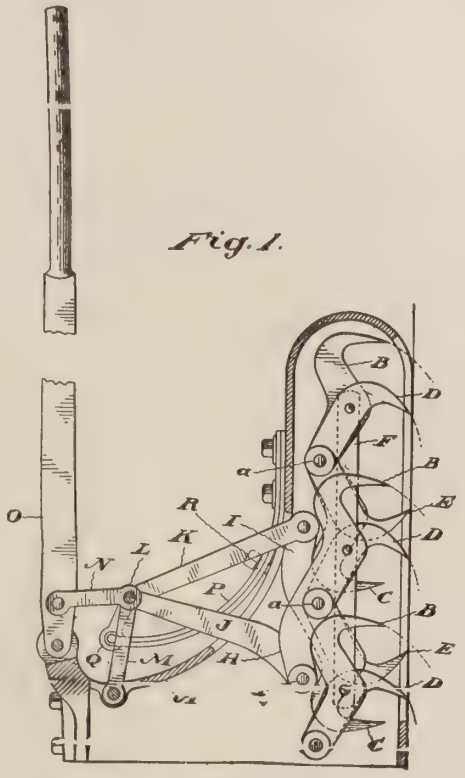


Fig. 1.

We want to prove to you the advantage of this set works in your mill and we are prepared to demonstrate its efficiency and superiority. Full information sent on application. Ask for our booklet on set works.

Buy Guaranteed Chisel Tooth Saws

You need have no doubt about the quality when you buy

SMITH'S CHISLE TOOTH SAWS

No. 2½ Tooth

They are backed by a guarantee as to their durability and will stand up better than any saw made. The shanks are made from a special steel, and we use only the GENUINE "HOE" BITS which are uniform and perfectly true.

Made in several sizes but the following are specially recommended.

NO. 2½ TOOTH—Designed for heavy feeds. Suitable for mills where independent steam feeds are employed, and also for edger saws.

NO. 3—Principally for hardwoods. The best saw where both soft and hard woods are to be cut.

NO. 4—Specially recommended for British Columbia, and for cutting soft, pitchy lumber where more throat room is required.

No. 3 Tooth

Smith's inserted and solid Tooth Saws are specified by the Largest Canadian Manufacturers of Mill Machinery.

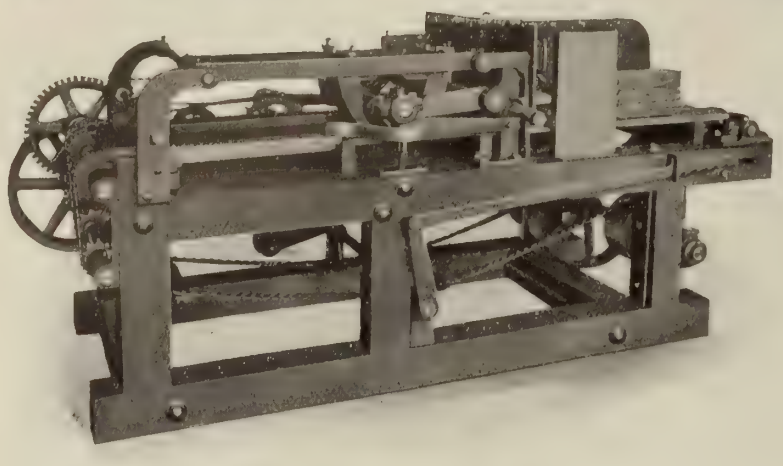
DISSTON
Quality Tells

The loyalty of our army of skilled mechanics is embodied in the quality of the goods they make, and this in the past Seventy-two Years engendered a like loyalty to the DISSTON BRAND on the part of the great multitude of saw, tool and file users.

HENRY DISSTON & SONS
INCORPORATED
Keystone Saw, Tool, Steel, and File Works
PHILADELPHIA, PA.

A Pair of Useful Machines

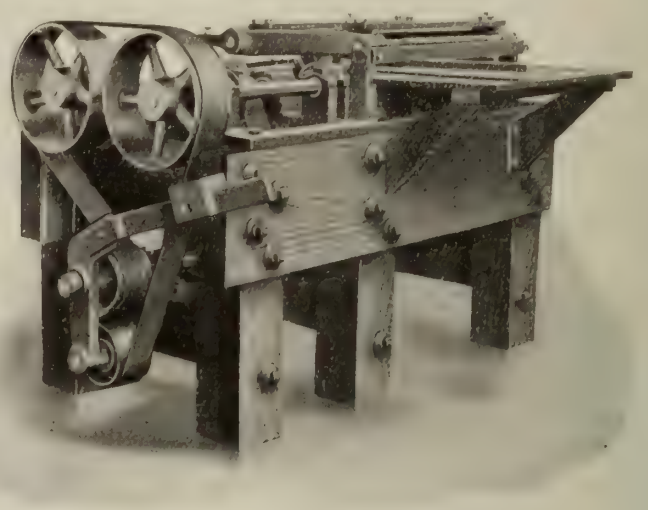


NO. 420 RECESSING MACHINE

Our No. 420 Automatic Recessing Machine will cut recesses with safety and dispatch.

Two boys will turn out more work than four men can accomplish of a similar kind on the ordinary cutter head most often used for the purpose. Will handle stock 20 inches wide by 30 inches long composed of one or more pieces, only occupies a floor space of 2 ft. 11 in. by 6 ft. 6 in.

This No. 50 lath edger will enable you to use cheaper labor, less men per thousand lath and get more lath out of every slab handled besides getting number one lath out of thin slabs that would be worthless using any other system. The saws are spaced to rip one and one half inches wide. The first saw cuts one and one half inches from the guide so there is no waste on straight edge stock.



No. 5 LATH EDGER

Send for complete catalogue of box machinery, resaw and saw mill machinery.

Mereen-Johnson Machine Company - Minneapolis, Minn.

JOHNSTON RE-SAW is a Lumber Saver and a Money Maker

The advantages of this machine over all others are;—1st—As a lumber saver using 10 and 12 gauge saws; 2nd—Can be set instantly to cut lumber from ½ inch to any thickness up to 4 inches: 3rd--Has screw adjustments so that thickness can be varied 1-12 of an inch under or over standard thickness, 4th—Automatic adjustment to prevent saw burning by slivers catching; THE FRAME being heavy is very rigid, so that saws can be run at high speed without vibration; THREE POINT driven; Three return live Rolls 8 inch by 20 inch automatic feed; Two grooved Rolls 8 inch diameter; one 16 inch adjustable Roll grooved; all gear: Power required 20 to 30 h.p: Weight 6,500 pounds: Floor space 8 feet by 9 feet 3 inches:

THE ONLY LOG-LOADER

"IT HANDLES ANY SIZE LOGS!"

That allows empties to pass through on the same track without jacking up the loader on spuds.

The McGIFFERT Steam LOG LOADER

It is self-propelling, moves and spots its own cars, dispensing with the services of a road engine.

It cuts the cost of logging some 66⅔: We would like to send you a book of facsimile letters that PROVE this.

A beautifully illustrated book, fully describing the working of the McGiffert and the immense savings it makes possible, awaits your request for **"CATALOGUE M."**

CHICAGO — CLYDE IRON WORKS DULUTH, MINN. — NEW YORK

It will pay you to equip your Tram Cars with our special

Charcoal Chilled Cast Iron Wheels

We will fit these to your old axles, or furnish new axles and wheels separately.

Price, quality and service considered, we can save you time and money.

Further particulars on request.

34

American
No. 34 Inside Moulder

Do you want a copy of our No. 34 Moulder Book?

It's a high class piece of advertising telling about a high class piece of wood-working machinery. We venture the assertion that the American No. 34 has no equal; but its reputation will not rest on our assertion, but rather on your judgment,—the judgment of the trade.

We leave it to you. Get the book.

It's a *fast feed machine*—It resembles our No. 77 Planer and Matcher in that respect. It will manufacture siding at 150 or more feet per minute, and the heads are equipped with jointers for that purpose. It has every convenience and adjustment that the idea, inside moulder, suggests, and some new ones that you have never seen before.

The book is yours. Let us have your address for a copy of it. Sent free postage prepaid.

Men with the Quality Viewpoint buy Berlin High-Efficiency Matchers

The Road to Bigger Profits Leads Straight to

Berlin High-Efficiency Matchers

When the announcement was made that the Berlin engineers had designed a new fast feed matcher, the news spread like wildfire. Millmen began visiting neighboring mills to see the new matcher running. They asked, "What better machines could we expect than the Berlins we are using?" The answer is easy.

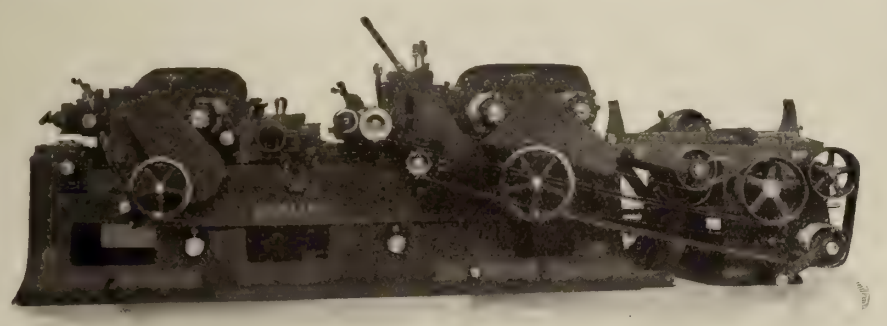
Those were the best we knew how to build then. But conditions have changed. Recognizing the need of a more efficient tool, our engineers evolved the new High-Efficiency Matcher. They have gone further than to meet the demand—they have anticipated—and have incorporated more automatic features in this matcher than were thought of by the most exacting mill men.

The man who sees the new matcher will not be disappointed. He'll see a machine that turns out a better grade of lumber and more of it at less cost than any machine on the market—a machine that makes the most difficult patterns true to standard—patterns that match with those made a year ago. He'll see a machine that turns out flooring, ceiling, partition and mouldings at 200, 250 or more feet a minute. In fact, he'll see a machine whose capacity is limited only by the feeder or special feeding device.

HIGH GRADE WORK

These new High Efficiency Matchers are replacing 2 and 3 of the old style matchers and are producing a higher grade of work. In the mills that watch grades and manufacturing costs they will tell you this new Berlin is raising grades 10% to 30% and reducing manufacturing costs 40% to 60%. We can refer you to firms where they have paid for themselves in a year. Sounds like an investment. Doesn't it? And it certainly is.

These new machines are insurance against mismanufactured stock. You'll find our side heads and profile attachment more accurate and efficient than any ever made. Mill men will tell you that tongue and groove work and outline patterns are up to standard—not just the first few days—but all the time. Its the milled high-speed steel bits that keep them up to standard.



An illustrated circular of the several models of this machine will be sent upon request

SMALL UPKEEP EXPENSE

The enthusiastic owner of one of these new Berlin matchers will tell you, that despite the terrific speed at which he has been running this big machine, upkeep expense amounts to practically nothing. The gravity tighteners, which allow belts to go back to their normal condition after heavy cuts, reduce belt bills 50% There are fewer gears on this machine than any matcher built, there being but five. The heads are one solid forging, and so strong the heaviest cut won't spring them. Pyts steel thin knives and milled high speed steel bits reduce knife costs. Gravity belt tighteners give the maximum pull for the minimum power consumed.

Less friction on the wearing parts means less power required. You'll be surprised at the small amount of upkeep expense there is on one of the Berlin matchers.

LABOR-SAVING DEVICES

The Berlin engineers, in designing this machine, had in mind ease of operation, as well as stability. Many automatic devices lessen the labor of the operator, giving him more time to grade stock.

The low bed-line—accessibility of parts—automatic boxes adjusting with wear in the cutter and side head journals—sight feed oiling system—encasing of the working mechanism to prevent accidents—and the many quick easy adjustments make the Berlin High Efficiency Matchers the best ever built.

Write for our latest circular giving detailed information,

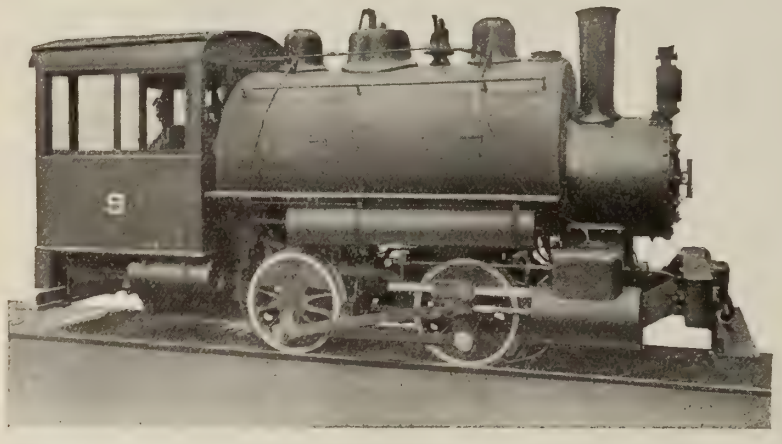
INDUSTRIAL LOCOMOTIVES

FOR BURNING COAL, WOOD OR OIL



Our locomotives are not built for one job only. They are built to last for years in the hardest service with a minimum expense for upkeep. This is the only proper way to build them.

Facility for making repairs when parts wear out was carefully considered in the design of our standard locomotives. Every detail is made with a view to securing the greatest possible reduction in the expense of repairs. Interchangeability reduces the time the locomotive is idle when repairs are necessary, as like parts will fit any other locomotive of the same size and design.

Consider the reduction in your profits when your locomotives are waiting for repairs.

Interchangeable parts, sure to fit, are kept in stock at all times and can be shipped at short notice.

MONTREAL LOCOMOTIVE WORKS

Makes It's Mark Vivid and Lasting

Marks that remain vivid and wear like iron are a real satisfaction to the man who handles lumber. The metallic pigments, like graphite, of DIXON'S LUMBER CRAYONS offer marvelous resistance to all kinds of weather conditions. Their marks are often visible after six months of severe exposure to sun and storms.

DIXON'S LUMBER CRAYONS

have always remained the recognized standard because of their one, uniform and dependable quality; their convenient and uniform shape and size and because of the careful selection of materials used in their manufacture. DIXON'S LUMBER CRAYONS are made in nineteen grades and colors, including black (six grades), red (two grades), blue (two grades), green, white, yellow, brown, terra cotta, violet, pink and orange. Some are made to fill particular needs—let us tell you more about them. Get acquainted.

Write for lithographed booklet No. 239, illustrated in colors.

An Aloxite Saw Gummer Lasts 8 Months — Gums 1225 Saws

IN an Indiana mill that cuts 20,000 feet of hardwood a day, a 12 inch Aloxite wheel gums a 15 gauge saw, 47 feet long in 26 minutes—going around it twice. One of these wheels lasted 8 months—put 1,225 saws in perfect condition before wearing out. The best of competing wheels takes from 40 to 60 minutes to put the same saw in shape and doesn't last half as long. The boss filer of the mill says Aloxite wheels cut wonderfully fast and can be forced to the limit.

This is the kind of wheel service your filers should be getting—they will if they order Aloxite wheels

LET US SEND YOU A TRIAL WHEEL TO SHOW YOU JUST WHAT ALOXITE WILL DO

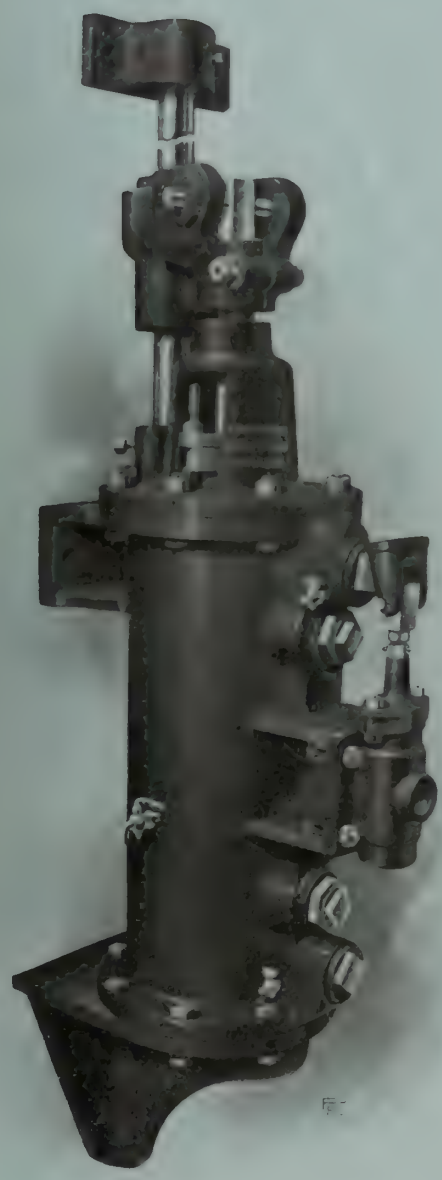
Get ACTION—
In Your Log Deck



The modern tendency in Sawmilling is to make every second count. We have speeded up the Waterous Log Deck to keep pace with this idea.

To do it we have re-designed and re-built practically every Machine in our Log Deck. More particularly, we have discarded the old cylinder with its leaky outside steam pipes and have replaced it by a cylinder and lever connections that answer the sawyer's movements instantaneously.

The 1912 Waterous Loaders, Kickers, Niggers, etc., not only work with a "punch" behind them but there is a snap and action in the work that makes the seconds count. It doesn't take two or three strokes of the Nigger to get the log in position for the cut. The log is placed on the Carriage without hesitation—and placed there **right.**

The new cylinder is shown in the attached cut. Steam ports are cast solid; valve gearing and valves are of strong design; a check valve regulates the exhaust to steam cushion the piston at both ends of the stroke. The valve operates by one lever, quickly, easily and on a short travel. Exhaust throttling plugs increase or diminish operating speed of the cylinder without affecing the power of the machine--this is a special feature. All wear on the rod, gland and packing is overcome by the guide bar support for the piston rod.

This cylinder is easily millwrighted, accessible, strong and convenient, and built in diameters of 8″, 10″ and 12″ is supplied on every machine of the WATEROUS LOG DECK.

Go over your Log Deck when the mill is running—do **you** make the seconds count?

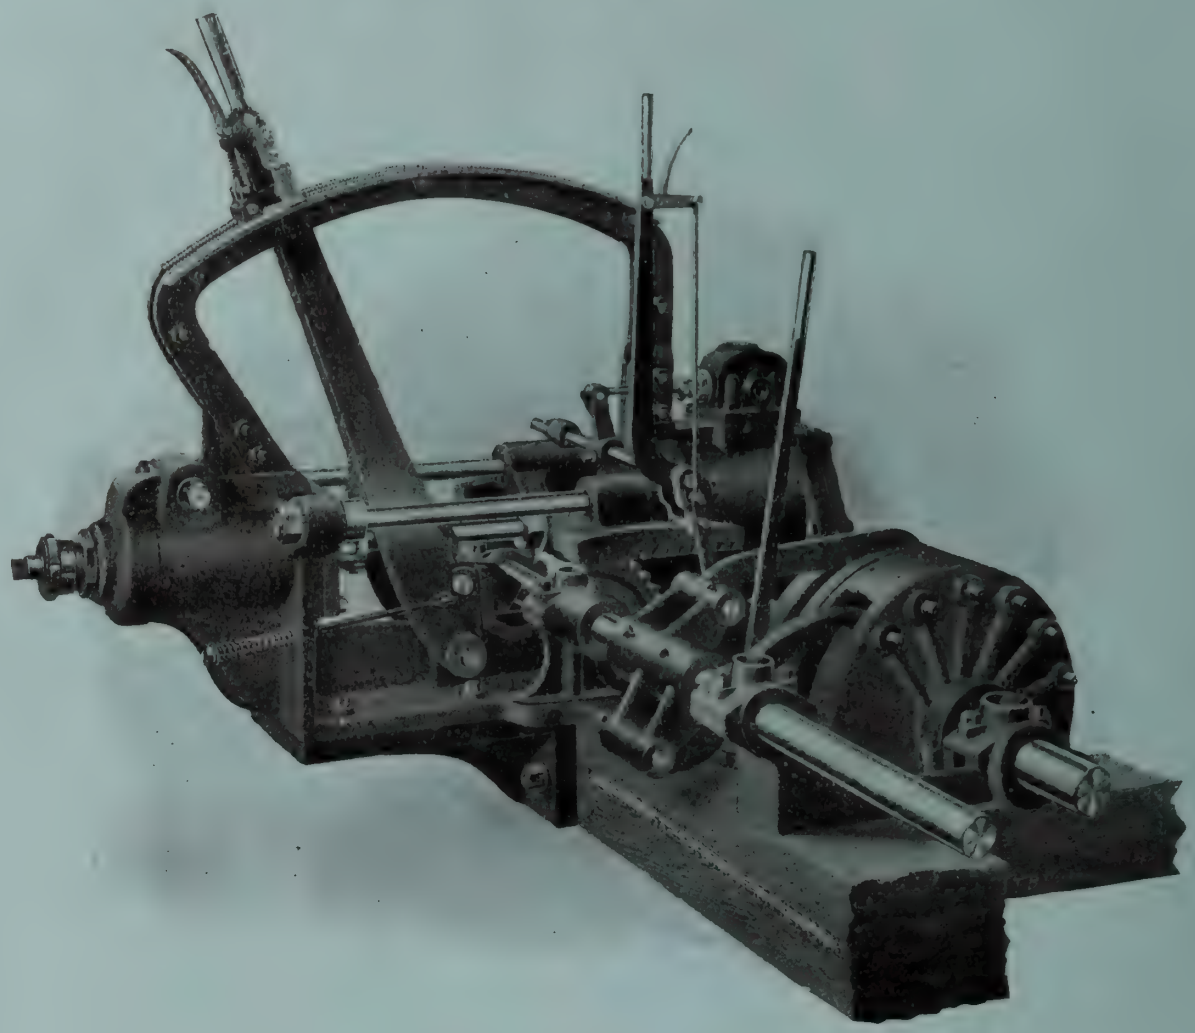
Did you ever really figure what it means to you to increase your cut 2,000 feet per day?



That is, increase it 2,000 feet per day without adding to your cost of sawing.

Or, in other words, what effect will it have on your profits if you can distribute your overhead charges and wages over an output 2,000 feet per day greater than it is now?

If you haven't figured it out, take your pencil and try it now.

You know how much it costs you to run your mill every day—divide that amount by the number of thousand feet per day in your present output—add 2,000 feet to your present output and divide your daily cost by that amount—and the difference between the two results represents the saving per thousand feet in your operating cost.

Then multiply that figure by your total output per season—and we think the result will surprise you, if you have never looked into this before.

This is just one of the ways in which our FOUR INCH STEAM SET WORKS will make money for you, and it will do just this because the users themselves have written us stating that they have increased their cut ***upwards*** of 2,000 feet per day.

May we send you further information about this Steam Set works?

There's Satisfaction in Ordering These Quality Grades of Lumber

If you're depending upon a supply of lumber you must get your orders in before the fall or you will be up against car shortage—a serious question.

Last spring it was bad enough, and even now there is a scarcity of cars—what will it be when the West begins to move this year's wheat crop?

For Fall and Winter requirements place your orders now and make sure of getting August and September shipments.

Right now we are ready to supply your every demand—at lowest market prices, in

HEMLOCK 1 x 4" and up, 1 x 6, 1 x 8, 1 x 10, 2 x 6, 2 x 8, 2 x 10

SPRUCE 1 x 4, 1 x 5, 1 x 6, 1 x 7, 1 x 8, 1 x 9 and 1 x 10

We can also fill orders, in any quantity, of **White Pine**—the finest well-watered stock obtainable. Always ready for shipment. We can dress or resaw.

Timber Limits for Sale
on Georgian Bay

The undersigned offer for sale in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; Tug Scow and other Lumber Equipment, including boom chains, plows, sleighs, etc.

The Limits, part of which have recently been sold, include: 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

The Parry Sound Lumber Co., Limited

1315-20 Traders Bank Building, TORONTO, CANADA

THE trend of trade is now towards our **CUTLER** Mills, when customers want anything at **BAY** ports for water or rail delivery, and our **LUMBER** is selling itself by repeat orders from any **COMPANY** to whom we make a shipment. Our stock is **LIMITED** but we still have a goodly quantity to dispose of at prices worth while considering.

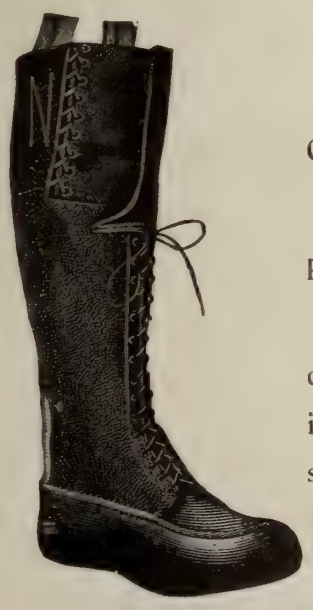
PENETANG SHOEPACKS

Gendron Penetang Shoepack Mfg. Co.

Sole Manufacturers, Penetanguishene, Ontario



TO THE TRADE

Gentlemen :—

We take this opportunity to advise you that shoepacks must necessarily advance in price in the near future, owing to the great advance in hides and leathers of all kinds.

We would ask you to place your order for fall at once, as we anticipate a larger demand than ever, and although we have made preparations for almost double the increase in our output, those of our customers who neglect placing orders, may be disappointed in shipments, besides running the risk of having to pay the advanced prices.

Yours truly,

GENDRON PENETANG SHOEPACK MFG. CO.

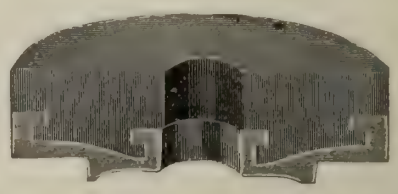
Pump Valve Service

Almost any pump valve will give good service while quite new, but the true test is in the duration of life.



L. R. & B. PUMP VALVES

retain their high efficiency longer than any other. The very best quality rubber used in these valves has been proved to outlast all others. When wear takes place the rubber can be refaced until the brass casing is reached thereby giving full use to all the rubber. The brass casing also prevents ports from forcing through. The good service and economy of these valves is being proved in thousands of plants—we will prove it to you too.

How This Rubber Belting Cuts Production Cost

Don't let slipping belts waste power—drain away profits. Plug up the leaks—save time, money, ***power***, by investigating—installing Goodyear Rubber Belting.

Goodyear Rubber Belting stands for ***saved energy***—**economy.** Built up of plies of rubberized fabric, cured and vulcanized into the solid piece. Neither slips nor stretches. Has the cohesiveness of rubber with the enduring strength of a specially woven cotton duck fabric from which all stretch has been taken out. It is steam, water, weather and rot proof.

The same high grade materials, the same skillful workmanship and the same years of experience that have built such famous service into the products of the Goodyear Tire & Rubber Co., U.S.A., is doing the same for Goodyear Rubber Belting and our many other rubber products.

GOODYEAR Rubber Belting

High Efficiency Belting

Every size for every purpose—1 inch to 60 inches wide—2 plies to 8 plies thick.

Goodyear Quality Belting

The highest grade made. Heaviest duck, best rubber, seamless, tough, durable. The saving main-drive belt for **Paper, Pulp** and **Lumber Mills**—for *all* mills where the horse-power transmitted is large and the demand for tensile strength is great.

Black Diamond Belting

Lighter in weight, lower in price than above, but same in *quality*. Great quantities sold to **Sawmill** trade. Hundreds of mill owners say it gives better service than any other belt ever used.

Red Cross Belting

The ideal belt for **Thresher, Small Sawmill** and **Flour Mill** use. Built to meet competition, yet is far superior to all other third-grade belts because made of tougher rubber, heavier fabric (which means better friction) and better wearing service and cover.

Stitched Rubber Belting

We make this belting in **Quality, Black Diamond** and **Red Cross** weights for those preferring this type of belting.

Elevator Belts

We make a specialty of **Elevator Belts.** Our Leg and Lofter Belts used in hundreds of elevators. Give superior service because of greater strength. Buckets never pull out. Plies never separate. Long efficient service guaranteed.

Conveyor Belts

For conveying crushed stone, grain, coal, ore, etc. Made in all thicknesses of face to suit requirements. Great toughness of rubber face prevents cutting and chipping; insures longest service.

IMPERIAL HIGH-SPEED FRICTION SURFACE BELT

Specially designed for planer, dynamo, generator or fan work where pulleys are small and high-speeded. If we haven't what you want in stock, we'll *make* it—and *remember*

Goodyear Rubber Belts quickly earn their cost in pains and power saved—yet they cost less than the common kind. Let our expert solve your problem. Send requirements or write for catalog to-night.

Our sales of the last four months 50% greater than those of last year. Defective goods returned only $23.93.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 32 Toronto, August 1, 1912 No. 15

Dearth of Labor in the Maritimes

There is no more striking feature of the industrial conditions of the Maritime Provinces to-day than the recent complete reversal of the market situation for most of the manufactured products. It is only a matter of a few years since manufacturers in the Maritime Provinces were experiencing difficulty in selling their goods at a price which meant a profit. It is scarcely more than a matter of months since conditions were far from satisfactory. To-day there is a very different story to tell. In all the important lines of industry the report is made that it is impossible to keep up with orders. The Maritime Provinces themselves are furnishing a better demand for manufactured articles than ever before, and with a few peculiar exceptions, the foreign markets are equally strong.

Going hand-in-hand with this situation is another, which is far from satisfactory, and which is, in fact, the only serious deterring factor in the industrial life of the Maritime Provinces. This drawback is a great shortage of skilled labor. Manufacturers with scarcely an exception report a splendid demand but a shortage of skilled labor which keeps them at their wits ends. This condition is not peculiar to the lumber manufacturing industry. It is in fact perhaps less acute in this industry than in some others. In the boot and shoe factories and the woolen factories perhaps more than others, great difficulty in securing skilled labor is experienced. In foundries and machine shops and large engineering works the same report is heard. Many of these industries have reached a stage where they would be warranted in increasing the capacities of their plants, but they are restrained from doing so because of the difficulty experienced in securing skilled workmen to operate their machines.

The lumber industry has in a measure escaped this difficulty because of the peculiar nature of its employment, as men become in many cases attached to the work. They are brought up in it and develop a preference for it which keeps them at the work most of their lives and frequently they stay with the one concern for many years. While lumber manufacturers however have not experienced great difficulty in keeping their mills fully manned, they have unquestionably suffered in their pockets from the scarcity of labor in other industries. There is no question that throughout the Maritime Provinces, many important buildings would be under erection to-day, consuming large quantities of lumber, if it were possible to secure sufficient skilled labor to man the new plants. Apparently it cannot be done and the Maritime Province lumbermen, in company with many other industries are only reaping a partial harvest, while business which they should be doing is being directed to manufacturers in other countries who are more fortunately situated.

Unquestionably the most serious problem which the Provincial Governments of New Brunswick and Nova Scotia have to face today is this essential one of attracting skilled laborers to the country. So far as farm labor is concerned they have been working persistently for some years and the results are commencing to show. In Nova Scotia for instance the immigrants during the year 1911 numbered 2057. Among these there were 205 farmers, 118 laborers, 357 miners, 107 craftsmen, 308 housewives, 187 domestics and 530 children. It will be seen from these figures that in the important elements of tillers of the soil, laborers for the mines, housewives and children the statistics are encouraging, but for the manufacturing industries which are crippled for want of skilled labor, there has been very little relief. The 107 craftsmen coming to Nova Scotia during the year would give but little relief. They would, in fact, probably do little more than balance the drain from these ranks, on account of migration to the west and to the United States.

The reasons for this difficulty should be searched out by the governments and by all who are affected by it. Undoubtedly the trades unions have had much to do with the situation and it is certain also that manufacturers have not sought the assistance of the governments to the extent that they should. The position taken by the government in this connection is that they are not warranted in importing skilled laborers unless it is shown that they cannot be secured at home. The immigration departments of the governments stand ready to search out skilled laborers and to help them to come to Canada, whenever manufacturers, asking for such assistance, show that there is a scarcity of such labor at home. The Nova Scotia government however, has received very few requests for such assistance.

It is however a debateable question whether the governments are justified in waiting for the complaints of the manufacturers before attempting to import skilled laborers. The immigration departments exist for the purpose of bringing useful settlers to the country. It would require but a brief enquiry into the conditions prevailing to-day to prove that there is a great need for skilled laborers and the governments would be justified in acting upon their own iniative in the matter.

There is need, in fact, for the governments of New Brunswick and Nova Scotia to take the question of immigration far more seriously into consideration than they apparently have been doing. The future development of the country is vitally dependent upon immigration. Great agricultural possibilities for instance are being wasted. In the Annapolis Valley during 1911 there were two million barrels of apples produced. A conservative estimate places the possible output of the valley in apples at ten million barrels. Out of a total of one million acres of orchard land in the Annapolis Valley only 50,000 acres are being cultivated. The outlook to-day is for an apple crop of just the same size as last year's. The Hertford Valley in Cumberland County, the greater portion of northern Queen's county, and various valleys in Pictou and Colchester, and in Cape Breton could produce fruit as successfully as the Annapolis Valley. The development of the fruit growing industry in these districts on a scale commensurate with its possibilities, would mean a greatly increased demand for apple barrels, which would afford a splendid opportunity for increased business for barrel manufacturers. The greatest importance however, of the proper development of the agricultural possibilities of the Maritime Provinces lies in the home

markets which increased population would provide for all kinds of manufactured products. The lumberman would have his share in the increased prosperity, and the whole country would be able to share as it should in the development which is taking place in other parts of Canada.

The Maritime Provinces are under a disadvantage on account of the extensive advertising which has been given to Western Canada. For the sake of the general prosperity of Canada it is all-important that the west should be settled. At the same time the movement has been directed so persistently to the west, that eastern Canada has suffered unjustly. The Dominion Government and the Governments of the Maritime Provinces ought to devote in future a greater amount of thought, energy and money to the settling of the agricultural lands of the Maritime Provinces and to the securing of skilled laborers to enable the manufacturers of the east to measure up to the opportunities, which at present they must ignore.

New Brunswick's New Timber Policy

The Government of the Province of New Brunswick is at present confronted with the task of devising a new policy for the management of its timber lands. All the crown timber lands are at present under license to operating lumbermen and the existing licenses will all expire in the year 1918. The value of a license to cut timber depends, more than anything else, upon its permanency. Lumbering operations require large amounts of capital. When it is a matter of doubt whether licenses to cut timber are to continue for any length of time without unfavorable alterations being made in their terms, the banks commence to look upon them suspiciously when presented as security for loans.

The present licenses in New Brunswick have only six more years to run. The margin of their safety as banking security has already been reached and it has become an imperative necessity that the Government of the Province announce definitely and at an early date, under what conditions licenses to cut timber on provincial Crown lands are to be granted after 1918. Without an early announcement of this nature a disastrous condition of affairs must result. The banks will commence to stiffen their terms for loans for lumbering operations. The owners of existing licenses, being in the dark as to their future position, will appreciate only their present powers and will cut all the lumber they can until their doubts have been set at rest. Such a set of conditions would be disastrous and intolerable. It would involve needless destruction of standing timber, followed by declining prices for manufactured lumber and inevitable failure for those who are not financially panic-proof.

That the government of New Brunswick will realize the necessity for immediate action seems probable. Already many rumors are abroad as to the terms of the new timber policy, indicating that the government has already discussed its terms informally. Some of these reports are curious enough to give further reason for an early announcement. One report has it that special inducements are to be given to saw-milling companies which will undertake to erect a pulp mill in conjunction with the sawmill. At first glance this seems plausible, but the question arises, whether this could be done without unreasonably penalizing those sawmill operators whose conditions make a pulp proposition impossible. Another report has it that the existing leases are to be wiped out and new ones created of which a chief characteristic will be that they will be made proportionate to the sawing capacity of the mills with which they are connected. The object of such a proceeding would be to give the small operator a better opportunity of conducting his business on a parity with the large ones, and also to prevent the accumulation of great timber holdings by any one company. The suggestion is one which probably has come from some of the smaller license owners, with whom the wish is father of the thought.

These rumors and the urgent necessity for the removal of uncertainty upon the subject, make the question one which the government cannot postpone without causing inexcusable injury. The Canada Lumberman understands, upon the highest authority, that before the next sitting of the Legislature of New Brunswick, the Government will make an announcement of its policy. If this is done, and time is given for public discussion of the question before the Legislature passes upon it, the lumbering industry, one of the most important in the province, will be relieved of a burden which is already pressing upon it heavily. For the sake of the whole industry and as a matter of public duty, the Government should lose no time in making its announcement.

Substitutes for Lumber

The serious questions involved in the increasing use of substitute materials in the place of wood, are being closely studied by the United States Forest Service. Investigations show that those who are marketing substitutes for lumber and its products are leaving no stone unturned whereby their products may be favorably brought before the purchasing public. This fact was well brought out in a recent interview with the Director of the Federal Office of Wood Utilization, at Washington, who expressed himself on the subject as follows:

"Substitution of other materials for wood has made startling and sensational advances, especially in the last five years. You can hardly turn to a large industry that does not show the inroads of a substitute for wood. Very likely the cry that our forests are going fast is in a measure responsible for this wholesale substitution. Looking at this matter from an entirely economic and practical viewpoint, without any special prejudice in favor of wood, I am as yet unable to decide whether the benefits of this wholesale substitution outweigh its bad features or not; but this I do know: substitution is the skeleton in the closet of practically every lumberman and wood-manufacturer in the country. It is the secret peril of the entire wood-working trade.

"Only a few years ago, during the late panic, the whole talk of the lumber trade was pitched to this key: 'Just wait until the railroads begin to hand out orders again and then we'll come back into our own all right and make up for lost time.' The railroads, however, did not come back into the market again for lumber—at least, not in the old sense of the term. The car shop that formerly used eighty million feet of wood came for only ten million at most. The substitute had made its appearance. The old style Pullman car contained twenty thousand feet of wood; the present type contains only four hundred feet.

"Previous to the panic, it has been the policy of the railroads running west of Chicago to use timber in their bridges, as well as in their depots, station platforms and wherever it could be used. They were expected to come back into the market for these, but they did not. Instead, they built concrete bridges, stations and culverts. In their platforms they used brick and cinders. The same change has been going on in the country districts. An old retail lumberman told me that he used always to sell the highway commissioners of his section timbers and lumber for the bridges and culverts in their territory; but suddenly they changed the policy of construction to concrete, and in self-defence he was forced to buy two brickyards.

"Small boats were formerly built entirely of wood; now they are largely galvanized iron and steel. The same substitution is going on in agricultural implement manufacture. The makers are using metal in the place of wood wherever they can. The reason they give for this is that the kinds of wood they need are becoming very scarce and dear. Wagon manufacturers are also making iron wheels and gearing to an increasing extent.

"Oddly enough, this problem of substitution is to a very large extent a question of advertising. How many wholesale lumbermen

advertise in the popular magazines and periodicals? Not a single lumber firm! One lumber association in the South, however, was shrewd enough to attempt to increase the use of its products by means of advertising directly to the consumer. What was the result? Why, the experiment was an immediate success, and it is hardly an exaggeration to say that the use of this particular wood was multiplied by the publicity it received. On the other hand, all the building substitutes are floated by liberal advertising campaigns. There is not a patent roofing, building paper, stucco or plaster that is not sold almost exclusively on an advertising basis. Undoubtedly the lumbering interests must go into the advertising field if they are to maintain a successful war against the encroachments of the building substitutes. Another way of meeting the assaults of the substitute is to find increased uses for each particular wood. Here is where the Office of Wood Utilization can be of greatest service and it is pushing its work as rapidly as possible."

New Timber Areas Explored

Some parts of Northern Ontario, for instance, the district in the vicinity of Georgian Bay, still hold timber, mineral and water power wealth which remains to be developed. According to several men who are in a position to know and who visited that district recently, there are still parts that are thickly dotted with valuable timber that is as yet untouched, owing to the fact that railways have not made their advent into the territory. A well known Canadian who has recently toured the country in the vicinity of the Pickerel system, that is, Pickerel, Barnardo, Sucker and Deer Lake and also Duck and Wilson Lake, states that the country is very valuable from a lumberman's standpoint and he further advises improvement in roads and water ways. At the present time Messrs. Chew Bros., the Georgian Bay Lumber Co., the Stahdler Lumber Co., and the Victoria Harbor Lumber Co., are cutting in this district, principally in the vicinity of the Dokis Indian reserve. The road from Trout Creek to Loring, which is about 45 miles long is in fairly good shape, but still it could be improved upon to a considerable extent. The farmers, who are principally Italians and Germans, get very low prices for their products, owing to poor transportation facilities, and the townships are as yet unorganized and the need of good roads in most of the districts is keenly felt. The lumbermen as a rule do not pay much attention to the roads. Their principal work is done in the winter and consequently they only make a winter road, which is of little use to the settlers. Another drawback is the fact that there is no good road material in the country and it all has to be imported. One improvement that lumbermen and settlers of this district want, is the abolishing of Wilson's dam on Wilson Lake and the raising of Dollars dam; three feet, which would give 35 miles of navigable waters between Dollars dam and Wilson Lake. A road from Lost Channel to Mowat is also asked for. This road would be about 7 miles long and would give better access to the Wilson lake country. It is said that the government have already interested themselves in these projects. There is a large amount of hemlock, ash, birch, beech and maple in this district. The advent of railroads will no doubt open up this country to a considerable extent in the near future. It is very valuable from a timber standpoint and its mineral wealth is practically unknown. The country is well watered and there a number of water powers of great commercial value that could be utilized by progressive lumbermen, who would develop them. This water power lies in the vicinity of Duck lake and Dollars dam.

Ontario lumbermen as a rule are rather pessimistic as to the future of the Ontario lumber supply. Many of them state that the province is practically depleted of its valuable timber, but when information such as the foregoing has been supplied, it would seem that the large lumber companies still have many years cutting ahead of them. There are numerous parts of Ontario that only need railroads to develop them and these tracts as a rule are well timbered. As Ontario progresses and as her citizens come to know her great resources particularly in the timber line to a greater extent, improvements are bound to come, in the railroad service. The railway companies that operate throughout Ontario are rapidly coming to recognize these conditions.

Illuminating Gas from Sawdust

Considerable attention has been attracted to a small Canadian saw-mill town, which is utilizing sawdust from a large sawmill to make illuminating gas. The venture has been a success in every way, and mill owners in general are taking quite an interest in the project. The mill cuts on an average of 120,000 feet of lumber per day, and in consequence makes large quantities of sawdust and other waste wood. A considerable quantity of this waste was used in the engine room, but enough and more remained to be utilized in the gas manufacturing plant.

The plant consists of two branches of five horizontal retorts, each capable of distilling ten tons of sawdust per day. The retorts are cast iron 1½ in. thick and 12 in. in diameter. They are provided with archimedean screws having conveyor flights of cast iron on a 2½-in. shaft. The sawdust is delivered to the screws in the retort from a hopper at the front and is then passed through a vertical 6-in. pipe to the retorts by means of a screw conveyor. The rate of speed of the main screw is regulated so that a thin layer of sawdust continually passes along the bottom of the retort from front to rear, and it is carbonized on its passage and delivered at the rear end into a main provided with screw conveyor by which it is delivered to an air-tight sheet iron car. There is a conveyor main common to all retorts at the rear end, and from this main the vapors and gases are passed to a condenser. The system is provided with a gas exhauster and scrubber, the pressure in the retorts being maintained by this means at as near zero as possible. The sawdust used is made from Canadian pine which was dried in a special steam drier before being delivered to the retort. Little attention is paid to the residual product consisting of wood alcohol, acetic acid, and tar, owing to the fact that the plant is purely for the production of illuminating gas, and again the residue is insignificant in quantity, and not worth the expense of refining.

Canadian lumbermen in general who have examined this plant are enthusiastic as to the future possibilities of the utilization of sawdust for illuminating purposes. Many of them are of the opinion that mill waste might be used to some advantage by passing all the waste wood through a "hog" and carbonizing it, as the process can be carried on automatically and with a minimum of labor. At the present time there are a large number of mills in Canada that are cutting anywhere from 50,000 to 200,000 feet per day. These mills are situated as a rule, in small towns of from 600 to 1000 population, and there is no doubt but that if their waste products were used to advantage the mill men would benefit largely, as well as the inhabitants of the villages and towns.

A novel electrical method of treating timber is said to have given striking results in France, and to have changed the greenest wood into perfectly seasoned material. A watertight tank of suitable size is required. The timber is piled on a large lead plate at the bottom until the tank is full, when a second lead plate is placed on top of the pile and connected to the negative pole of a dynamo, the bottom plate being connected to the positive pole. The space around the timber is then filled with a solution containing 5 per cent. of resin, 10 per cent. of borax, and a trace of carbonate of soda. On turning on the currnt, it passes from plate to plate through the wood, driving out the sap, and the resin and borax takes its place in the cells and interstices. This process being completed, the timber is taken out and dried, when it is ready for use.

Notable Pulp and Lumber Organization

Unique Timber and Power Resources of the Trois Pistoles Pulp and Lumber Company—Important Developments under Consideration for Production of Pulp

J. E. Tobin, Manager Trois Pistoles Pulp and Lumber Co.

During the past few years one of the most significant industrial developments in the province of Quebec has been the great attention which has been directed to its pulpwood resources. It has been borne in upon the minds of the people of Quebec that in their vast forests of spruce they have a natural resource which will, if properly conserved, yield great wealth to the province for all time to come. The disappearance of the pulpwood forests in the Eastern United States has given to the spruce of Quebec a value far beyond what was ever expected until a few years ago, and already a great pulpwood producing industry has grown up in many parts of the province. It is not an exaggeration to assert that Quebec, as a pulpwood, and even as a pulp and paper producing province, will, in the course of a very few years, occupy a foremost place among all the pulpwood producing countries of the world. Not only is this already assured, but Quebec occupies the enviable position of being able to depend upon a practically everlasting supply of pulpwood, if these resources are exploited in a manner regulated by reasonable precaution against destruction by fire and practical operating methods based upon modern principles of conservation.

Realizing the great opportunities thus presented, many of the more progressive lumbermen in the province of Quebec are devoting their attention and their means to the building up of pulpwood, pulp and paper producing industries in those localities which present favorable conditions, of which fortunately there are many. One of the companies which have seen the greatness of these opportunities and are preparing to develop them, is the Trois Pistoles Pulp and Lumber Company, of Tobins, P.Q.

On the Riviere Trois Pistoles, about 146 miles below the city of Quebec, on the south side of the St. Lawrence River, the Trois Pistoles Pulp & Lumber Company have one of the most interesting and efficient plants for the production of lumber, shingles, lath and rossed pulpwood in the province of Quebec. The mills are the mainstay of a prosperous little village known as Tobins, being called after the principal member of the company, Mr. E. W. Tobin, M.P., of Bromptonville, Que., president of the Tobin Manufacturing Company, of the latter place.

The town of Tobins is located on the Intercolonial Railway, about two and a half miles from the prosperous village of Trois Pistoles. Its location on the Riviere Trois Pistoles is at the mouth of the river where it empties into the St. Lawrence River.

The management of the company is in the hands of Mr. J. E. Tobin, who fulfills also the duties of treasurer. Mr. Tobin, who has risen rapidly, commenced his business career in the employ of Mr. E. W. Tobin, as a clerk in his store, at the age of fifteen. A year later he had shown his capabilities so clearly that he was entrusted with the management of the store. Subsequently he associated himself with the Lotbiniere Lumber Company, at Lyster, Que., and remained with them as manager for four years. Then he spent a couple of years as manager for the Tobin Manufacturing Company, at Bromptonville and he was next appointed manager of the Trois Pistoles Lumber Company. He has occupied this position with unique success for the past four years. Mr. Tobin is a young man, filled with ambition, and looks forward to bringing about important developments at Tobins, in connection with the extensive water powers on the Riviere Trois Pistoles. He has already attracted the interest of an important group of capitalists in these water powers and is planning for the erection of a large pulp mill. The company is in an ideal situation for such a proposition, both as regards the available water power and the supply of timber.

Trois Pistoles Pulp and Lumber Company—the Upper Mill

Trois Pistoles Pulp and Lumber Company—the Lower Mill

Summary of the Company's Timber

To demonstrate the truth of this statement one needs only to examine the estimates of the company's timber resources. In tabular form these resources make the following showing:—

	Cords of Pulpwood	ft. Spruce Logs 8″ & up	ft. other timber ft. Cedar	ft. other timber mostly Birch
Seigniory or Freehold.	522,000	60,000,000	20,000,000	40,000,000
Bedard Limits.	261,000	65,000,000	87,000,000	17,000,000
Radout Limits.	63,000	20,000,000	10,000,000	5,000,000
Other Limits.	23,000	2,000,000	2,000,000	not estimated
Totals	869,000	147,000,000	119,000,000	62,000,000

Estimating the spruce logs at two cords of pulpwood per thousand feet, the 147,000,000 feet would make 294,000 cords of pulpwood. This brings the total in pulpwood to 1,163,000 cords, and it is estimated that a further 230,000 cords are available on farmers' lots. For a pulp-producing proposition, therefore, the company's holdings and power possessions are exceptionally favorable and there is every likelihood that the near future will witness the erection of a large pulp producing plant at Tobins.

The Company's Two Saw Mills

The sawmilling plant of the Trois Pistoles Pulp & Lumber Company includes two mills. The lower mill near the mouth of the river and close to the I. C. R. tracks, is a building 41 x 124 feet, with a wing 41 x 68 feet, exclusive of the boiler and engine rooms which are constructed of brick. This mill is equipped with four boilers having a capacity of 500 h.p., and twin engines having a capacity of 340 h.p.

The plant is run exclusively by steam. With its equipment of circular and gang saws, shingle mills, lath machines and rossers, this mill has a capacity of 40,000 feet of sawed lumber, 125,000 shingles, 20,000 lath and 25 cords of rossed pulpwood per day. An important feature is the yard for piling, which is about 2,500 feet x 1,500 feet. A yard track some 2,000 feet in length connects with the wharf, 450 x 800 feet, on the St. Lawrence River. In connection with this mill the company has large stables, shops and numerous dwelling houses, including the manager's residence and office. The upper mill is situated about two miles up the Riviere Trois Pistoles from the lower mill and is connected with the main line of the I. C. R. by a spur track. The main part of this mill is 68 x 154 feet. It is equipped with three boilers having a capacity of 600 h.p., and twin engines with a capacity of 340 h.p. The sawing equipment includes circular, band and gang saws, shingle and lath machines and rossers, and its capacity is 50,000 feet of sawed lumber, 125,000 shingles, 20,000 lath and 30 cords of rossed pulpwood per day. The yard is 700 x 900 feet, and the company also have stables, shops and houses for employees at this point.

When acquiring the properties along the Riviere Trois Pistoles, the company also acquired a grist mill located half way between the two mills, the object being to obtain absolute control of the river. Near each of the mills the company owns large springs of water suitable for domestic purposes and capable at a moderate expense of furnishing abundant fire protection. The exclusive right to furnish the village of Trois Pistoles with water power is also owned by the company.

Extensive Timber Resources

The timber owned by the Trois Pistoles Pulp & Lumber Company is easy of access and includes 40,000 acres of freehold lands, 70,000 acres within forest reserve and 20,000 acres outside forest reserve, a total of 130,000 acres.

These timber holdings include the Seigniory of St. Mathieu, 40,340 acres, which is held in fee simple, 28,000 acres of which are exempt from even local taxation. No portion of this Seigniory is subject to government taxation or stumpage dues. On these lands, as will be seen from the estimate given above, the company have 522,000 cords of pulpwood, about 20,000,000 feet of cedar, 60,000,000 feet of spruce logs, 8 in. and up, and about 40,000,000 feet of other timber, mostly birch; a goodly heritage in itself. The timber upon this property is not its sole resource. It contains also quarries of red sandstone of excellent quality, which have already been moderately developed. Embraced within its limits are also about fifteen lakes, affording the possibility of water storage under practical conditions, for maintaining a uniform flow of water in the rivers Boisbouscache and Trois Pistoles.

Under license from the Province of Quebec, the company hold 70,000 acres of limits, within the Forest Reserve, and adjoining the freehold lands. Outside Forest Reserve the company holds about 20,000 acres of lands under provincial license. The limits within Forest Reserve are withheld from colonization. Those outside are subject to colonization.

The driving facilities on the rivers within the company's limits are excellent. The Riviere Trois Pistoles is one of the principal rivers of the province. It has a large and steady flow of water during the entire year. One of its many tributaries, the Boisbouscache, is an important stream itself, because of its numerous lakes. A comparatively small outlay only is involved for converting these lakes into reservoirs for the storage of water to make a steady flow throughout the year certain in times even of extreme drought. In addition, there are few better opportunities for the development of large water powers than is afforded by the Riviere Trois Pistoles, in the last two miles of its course before reaching the St. Lawrence.

The Trois Pistoles Pulp & Lumber Company own all the shore rights and water privileges at the mouth of the Riviere Trois Pistoles and running up that river about three and one-half miles on one shore and about three miles on the other. They also own all the river improvements and by virtue of an order-in-council of the Quebec Government, have power to collect tolls for their use. In a distance of two and a half miles from its outlet the Riviere Trois Pistoles has an actual fall of about two hundred feet. Four of these falls will permit of profitable development.

The Trois Pistoles Pulp & Lumber Company attach great importance to their pulpwood property and their water power. The Quebec Legislature recently passed laws prohibiting the export of pulpwood taken from Crown lands. It is a known fact that the supply of pulpwood in the United States is well nigh exhausted and that nearly all mills using wood pulp have been dependent, either wholly or in part, upon importation of Canadian wood. By this act of the Province of Quebec, the supply of pulpwood from the province available for purchase by these mills is restricted to freehold lands. Pulpwood from Crown lands must be converted into pulp or paper in the province. The inevitable result is a marked increase in the value of limits close to ample power, easy of development, and a far greater appreciation of the value of freehold lands.

The operations of the company, dating back to 1904, have been characterized by a policy of careful conservation of their timber. They have preserved their own timber as far as possible, and drawn extensively upon the timber which could be purchased from farmers. The result is to-day that the company are in an excellent position in regard to all the essential elements of a successful pulp and lumber producing organization and that they find themselves on the threshold of great developments at a time in the history of the pulp and lumber industries which has every indication of being the commencement of an era of exceptional expansion and prosperity.

With the capable management which Mr. J. E. Tobin gives to the affairs of the company and with the assistance of a board of directors who keep closely in touch with the business conditions of the industry, it seems assured that a successful future is before the company. The officers of the Trois Pistoles Pulp & Lumber Company are as follows: President, E. W. Tobin, M.P., Bromptonville; vice-president, C. I. Gagnier, Springfield, Mass.; secretary, J. A. Begin, M.P., Windsor Mills, P.Q.; manager and treasurer, J. E. Tobin, Trois Pistoles, P.Q.; directors, E. W. Tobin, C. I. Gagnier, John Bird, Canton, N.Y.; Fred S. Morse, Springfield, Mass.; R. D. Tobin, Bromptonville, P.Q.; J. E. Tobin, J. A. Begin and Royal Newton, Coulton, N.Y.

The Future Supply of Canada's Lumber

Honorable W. R. Ross, the present Minister of Lands of British Columbia, a man who has shown himself to be one of the most alert and able administrators in his particular line, that the province has ever had, is enthusiastic about the future possibilities of British Columbia's timber trade. The Honorable Mr. Ross has aimed to make himself acquainted with the province by personal observation, and by meeting the manufacturers and others who are vitally interested in the province's future welfare. In pursuance of this most commendable policy he set out, a short time ago, on a most arduous trip to examine the timber areas along the Fraser and other rivers, and incidentally an inspection of the measures being taken to safeguard British Columbia's great timber interests. The minister is more than enthusiastic since his return from the trip, as regards the future possibilities of the timber district. He admitted that he was surprised at the stand and size of the timber, and stated that in his opinion the estimates of the department would have to be doubled.

While declaring that there are no detailed estimates, Mr. Ross says that there is easily twenty-five billion feet of timber above the north and south forks of the Fraser alone, and further, that the Crown still possesses a lot more timber than is under lease in that area. It is also said that the district contains one of the most wonderful pulp areas in the world. "There is the biggest opportunity ever offered in the world for the development of the pulp industry in that one portion of the province alone," says Mr. Ross. "There is spruce and cottonwood in illimitable quantities. Water powers exist in plenty, and the government railway policy is giving the wealth of the north country the transportation facilities, which is all it needs for successful and more profitable development."

The country, from all reports is becoming very quickly settled, and parts where there is land available for farming purposes are rapidly being occupied. "I intend to have a special investigation made by experts as to the uses to which the particular timber of this province can be put, and the markets in which it can be disposed of," said the minister. "My forestry policy is to promote in every way the development of industries which will utilize the timber of British Columbia."

From all accounts, Mr. Ross is a close observer, and one who is not given in any way to exaggerate. Canadians have long known the possibilities of British Columbia as a timber country, but they have never paid very much more attention to its development. The East if the present rapid increase in building and exports continues, will soon have its lumber supply practically depleted, and in that case British Columbia must be looked to to supply Canada's building materials. If the forests in this part of Canada are properly taken care of, i.e., if the Government has a good system of fire protection and incidentally does not allow the lumber companies to waste any of the valuable timber areas of the province, there will be a great future in store for the timber industry on the western coast. Exports too, will benefit largely. The Panama Canal is rapidly nearing completion and from all accounts, British Columbia's timber exports will be doubled or even trebled when that great waterway is opened to the commerce of the world. It therefore behooves every British Columbian, no matter what his station in life may be, to do all in his power to assist a man of Mr. Ross's calibre, a man that thoroughly understands his business, and moreover one who will work for the interests of the people whom he represents.

Nova Scotia Lumber Trade Conditions

Abnormal Freight Rates for Ocean Carriage Deflecting Trade from Great Britain to United States Markets - No Decline Expected — Foreign Market Conditions

By the Editor of the Canada Lumberman

Halifax, N.S., July 20th: (Special correspondence of the Canada Lumberman): In many respects the lumber trade of Nova Scotia during the present year has been similar to that of New Brunswick. Of the export markets, Great Britain has been discouraging on account of high ocean freight rates and the United States markets have been unexpectedly active. The South American market opened well but fell off badly and the West Indies market has been firm and a little stronger than last year. Shipments to Great Britain are very small. Delivery values are practically the same as last year but the freight rates are out of all proportion, being about 50s. to 60s. per standard for continental ports. Last year they were from 35s. to 40s. per standard. A vessel was recently loaded at Mulgrave, N.S., on a freight rate of 60s. for a United Kingdom port. Prices in the English markets, although higher than a year ago have not shown an advance in proportion to the advance in freights. Reports from several of the larger brokers in the Old Country give good reason for believing that prices in England will at least hold at their present level and that possibly they may advance. Vessels have already been secured for next year on a time charter at the rates which are in force to-day, indicating that ocean freight rates are not likely to decline.

A well known representative of an English firm of importers when asked for his reason for expecting prices to hold, said that buyers in the Old Country were now persuaded that freight rates would not come down. Under these conditions English buyers would find out presently that if they want the lumber they must offer the prices asked. That there has been no falling off in the demand for Maritime Province stocks in the Old Country as a result of the high freight rates is shown by the consumption at Liverpool and Manchester for the month of June, which amounted to 7960 standards as compared with 5,710 standards during June, 1911. The stocks on hand, however, at the end of June amounted to 23,250 standards, being larger than at the same date in any previous year since 1907, when the total yas 27,030 standards.

Decline in South America Demand

The South American market has recently shown a decided falling off in demand. At the beginning of the season there was a good demand from South America and most of the stock now being shipped to that market was sold in the late winter or early spring. Nova Scotia manufacturers contracted then at good prices and are therefore very little affected by the recent falling off in the demand. This stock is sold f.o.b. Nova Scotia ports, to New York and Boston brokers who charter vessels and ships to South America from Nova Scotia. Freights to South America have risen, in harmony with freights to other points. They are now ranging from $11 to $12 per thousand, whereas a year ago they were from $8.50 to $9.50. The demand in South America has been mostly for 1-in. x 3-in. and 1-in. x 6-in., with a small percentage of 1-in. x 4-in. and 5-in., and not infrequently some 1-in. x 7-in. to 1-in. x 11-in. The lengths are nearly always 12 ft. to 16 ft. with 40 to 50 per cent. of this 16 ft. A fair amount of scantling has also been required for the south American trade. This includes 2-in. x 3-in., 3-in. x 3-in. and 3-in. x 4-in., with occasionally some 3-in. x 6-in. and 3-in. x 9-in. A considerable quantity of 1-in. x 12-in. has also been going to South America, the price of a cargo depending largely upon the quantity of 1-in. x 12-in. included. A fair value for an assorted cargo of boards and scantling with 10 per cent. of 12-in. would be about $18 f.o.b. shipping port. This would be on an ordinary market. At present however, practically no sales are reported, there being very few enquiries out.

Good Demand from the West Indies

In the trade with the West Indies the demand is entirely for 1-in. pine and spruce of the ordinary run of Nova Scotia stock and spruce 10 ft. and up, 6 in. and up is easily sold at a value of from $15 to $16 f.o.b. while pine sells at a certain price for ten feet and up contents and another price for under ten feet contents, the values at present being about $20 for the larger stock and $14 for the smaller. The West Indian trade is fairly good, the only difficulty being to obtain tonnage. Freights are at about $6 per thousand, which is from $1 to $1.50 higher than a year ago.

In connection with the United States markets, delivered values are from $1.50 to $2.00 higher than a year ago. Freights are from 50c to $1 higher, the going freights at present being about $3.75 to Boston, $4.25 to Sound ports, and $4.75 to New York, for spruce or dry hemlock, proportionate rates being charged for green hemlock.

Practically the whole lumber market situation in Nova Scotia to-day hinges upon the freight rate question. Those who have followed it closely believe that no decline in freights can be expected for the remainder of the present season. The conviction is growing indeed, that next year will see the freights quite as high as they are to-day. An indication of the scarcity of tonnage is afforded from the fact that one vessel is only being loaded to-day with lumber for South America which was ordered last autumn. Last summer in fact, many vessels were available for which lumber cargoes could not be secured. This year the available vessels at some of the important ports could have been loaded five times over.

One of the difficulties which lumber shippers have to contend with in connection with the West Indian trade, aggravates the scarcity of tonnage. The Pickford and Black Steamship Company are not permitted by the government to load lumber below deck, the idea being to encourage the shipment of manufactured articles upon which the labor involved in production has been greater than is the case with lumber. The object is a satisfactory one for those who produce the other goods but it places a serious handicap upon the lumber trade with the West Indies at times like the present when tonnage is scarce.

Market Conditions and Prices in United States

The present price for hemlock delivered at New York is about $18 to $19 for 2-in. x 4-in. merchantable stock with a fair run of length. A year ago the same lumber was bringing $17.50 to $18.50. The demand in this line is strong for 10 ft. and 18 ft., also for 20 ft. There is a fair demand for 12 ft., while 14 ft. and 16 ft. are not desirable.

Hemlock boards are in strong demand, random being worth $19.50 to $20 at Boston. Last year the same stock was bringing $18. Random boards include 5 in. and up, 8 ft. and up, the greater part being 6 in. and up and 10 ft. and up.

Spruce slab lath 1⅜ in. are selling at about $3.75 to $3.85. A year ago they brought $3.40 to $3.50.

A large export trade is being done with United States ports, in spruce planks and studding. An assorted cargo of planks and studding will bring about $22 at Boston or Sound ports for a specification averaging about 15 ft., 35 to 40 per cent. being 8 in. and up wide. Last year a similar cargo would bring about $20. Such a cargo would include 2 inch x 4, 6, 7, 8, 9, 10 and 11 inch, 4 in. x 6 in. and 6 in. x 6 in.

The cut in Nova Scotia this year has been very difficult to estimate, but it is probably about the same as last year. The spring was exceptionally favorable for stream driving and very few of the drives were hung up. During the last week in June and the first two weeks in July, the weather was extremely dry and bush fires commenced to reach dangerous proportions. Fortunately, a general rain came in time to extinguish all the fires before any serious damage resulted.

The local demand for lumber in Nova Scotia is exceptionally strong, being probably better than it has ever been before. This is the result of extensive building operations. In Halifax alone it is estimated that building operations in progress and under contemplation total $3,000,000 in value.

Messrs. Homan & Puddington, New York, report under date of July 13th as follows: Our lumber market, generally speaking, is in excellent condition both from the sellers' and buyers' standpoint. Building is going on in the city and most of the surrounding country in good shape and barring politics, looks prosperous.

Spruce timber, plank and boards is in good demand, and for all desirable sizes good prices are being obtained—ranging from $21 to $27 per M. Hemlock 2 x 4 is selling fairly well in all 10, 16, 18 and 20 ft. lengths, while the intermediate sizes go hard at $16 to $17 per M. 1 x 2 furring, faced one side, is worth $22 to $23 per M.

Spruce side boards 10 ft. and up long, 6 inches and up wide to average 7 inches wide bring $20 to $21 per M., while those averaging only 6 inches won't bring over $19 per M.

Laths—Receipts are moderate, and sales were made at $3.75 to $3.80 per M.

Messrs. Chase, Talbot & Co., New York, report under date of July

15th as follows: The season is now sufficiently advanced to enable one to forecast the probabilities for fall trade in the metropolitan lumber market.

Some of the larger yard dealers have declined to pay prices demanded, and have resorted to the alternative of depleting yard stocks, which they carried through the winter, even to the extent of resawing, to provide necessary sizes. Those who have pursued this method declare they will not pay the price until forced to do so. Their anticipation of a sagging off in price during July and August, has not been realized, the mills being amply supplied with orders for August sawing. It is likely that we shall tire them out, and that the early fall will witness the demand for a considerable quantity of spruce.

Yard dealers admit that they are doing an active business, in fact, all that they can conveniently handle, and for the most part, find it difficult to take in stock, as fast as they make deliveries.

The yellow pine market continues firm and in consequence of excessive orders booked ahead, together with unprecedented floods throughout the southern belt, there is justification for a belief in the permanence of their prices.

West Virginia spruce holds firm at full list. Apparently, there is no abatement in the demand.

We quote spruce, 2 x 4, desirable lengths $23.50 to $24.00. 2 x 6, 2 x 8, 2 x 10, 4 x 6 and 4 x 8, fair run random lengths $25.00. 3 x 8 and 3 x 9, $25. 2 x 9, 2 x 10, and 2 x 12, or 3 x 9, 3 x 10, and 3 x 12, $26 to $27, according to lengths.

Recent quotations for eastern dimension spruce are practically on a par with the West Virginia list, which is $25; 8 in. and under, 20 ft. and under, $27; 10 in. and 12 in., 20 ft. and under.

Lath.—The trade has absorbed the arrivals at prices varying between $3.60 and $3.75.

Unwise Land Classification Scheme

American Forestry Association Protest Against Indiscriminate Listing of Agricultural Lands in National Forests

One of the most important actions taken by the directors of the American Forestry Association, who held their midsummer quarterly meeting in the White Mountains on July 17, 18 and 19, was the passage of a resolution protesting vigorously against the proposed amendment to the Agricultural Appropriation Bill, soon to be acted upon by the Senate, which provides that all lands in the national forests, "suitable and fit" for agriculture, must be classified and listed for settlement whether it is wise or unwise to remove them from public control. This resolution has been sent to each member of the Senate with a request for its careful attention.

The directors, with a number of guests, including state foresters, forestry instructors, state officials, timberland owners, paper and pulp company officials and a number of other prominent men, gathered at Plymouth, N.H. on the morning of July 17 and, through arrangements by Col. W. R. Brown, of the Berlin Mills Company, journeyed to North Woodstock in automobiles. The afternoon was spent in looking over the Lost River reserve, recently acquired by the Society for the Protection of New Hampshire Forests, and the members of the party climbed down the course of the Lost River for some distance among the mammoth boulders, into the caves they form, and viewed the remarkable scenic effects caused by some remote convulsion of nature, with wonder and delight. Here is a spot which, when the road to it is improved, will become the Mecca of almost every sight-seeing party going into the White Mountains.

There followed in the evening, at the Deer Park Hotel, a meeting participated in by the directors of the association, and under the auspices of the Society for the Protection of the New Hampshire Forests. Some three hundred people attended, many of them of national prominence.

W. R. Brown, president of the New Hampshire Forestry Commission, told about the progress of forestry in New Hampshire during the year; a paper by Montgomery Rollins, on the acquisition of Lost River was read; E. E. Woodbury told of the town's interest in the Lost River, and there were talks by Dr. Finley, ex-governers Quimby and Woodruff, Dr. Drinker, Dr. B. E. Fernow, of Toronto, P. S. Ridsdale, executive secretary of the American Forestry Association, and others.

The following day the entire party journeyed by automobile to Bretton Woods, where Thursday and Friday were spent in viewing the Crawford Notch reserves, and at several important meetings discussing forest problems and conditions of the day. The directors of the American Forestry Association held their sessions at the Mount Pleasant and the Crawford House.

Reports of the condition of the association were most satisfactory and showed that the membership is steadily growing, that the sphere of its influence is rapidly extending, and that it is now regarded as one of the most important organizations, for the good of the general public, in the country, and as such is receiving steadily increasing support and recognition.

At the fifth annual forestry conference meeting on the afternoon of July 18 there were represented the American Forestry Association, the Society for the Protection of New Hampshire Forests, the New Hampshire Timberland Owners' Association and the Association of North Eastern Foresters.

In the evening H. S. Bristol, superintendent of Woodlands for the Delaware and Hudson Railway Company, spoke on problems of forestry as they relate to the railway; Prof. Walter Mulford, of Cornell, discussed the prospects of forestry as a profession; Prof. W. C. O'Kane, of the New Hampshire State College, spoke on the present status and prospects of the gypsy moth and the brown tail moth in the state; George H. Wirt, chief forest inspector of Pennsylvania, gave an illustrated lecture on the management of state forests in Pennsylvania.

At the annual meeting of the Society for the Protection of New Hampshire Forests, held on the morning of July 19, reports were made on the progress of the society's work in the past year. In addition Herbert Welsh, of Philadelphia, spoke about the progress upon the Sunapee Forest Reservation, and Harris A. Reynolds, Secretary of the Massachusetts Forestry Association, told how he is organizing branch associations in that state.

The ever-interesting and vital question of the taxation of forests was discussed at the concluding meeting on Friday afternoon. Dr. B. E. Fernow spoke on the principles underlying the taxation of forests. Prof. F. R. Fairchild, of Yale, discussed the taxation of forests in America and abroad, and Prof. Charles J. Bullock, of Harvard, gave his ideas on practical plans for taxation in New Hampshire and Massachusetts. The other foresters and lumbermen present joined in the discussion, which, while it resulted in the enlightenment and instruction as to ways and means, of all who were present, did not reach any definite conclusion as to the best way to overcome existing difficulties.

In the evening, at the Crawford House, Philip W. Ayres, forester of the Society for the Protection of New Hampshire Forests, gave an illustrated address on the forests of the White Mountains.

Will Erect New Mill at South Bay

John E. Moore, St. John, N.B., has bought out the Canada Woodenware Company at South Bay, N.B., about five miles from St. John. He proposes to make a number of changes to the plant and to erect a modern sawmill near the pail factory. Building operations are to be started at once and it is expected that the plant will be completed and ready for operation early next spring. The equipment of the new mill will include a stock gang, band saw, and band resaw, twelve stave machines and about three heading machines. In addition to this the new plant will include a planing factory and in the course of a year, probably a box factory. The intention is to work up all the small stuff that has not formely been utilized. The plant is favorably located, being on the line of the C. P. R., five miles from St. John. It also has good water shipment facilities. The new plant will be installed by the St. John Iron Works.

New Log Mark for B. C. Lumbermen

The provincial government of B. C. have issued an entirely new system of private marks for lumbermen and they will cancel the old marks as fast as the new ones are given out. In order to put the new system into practice and see that it is practically enforced the department has despatched Inspector William Black on the government launch R. J. Skinner, with instructions to visit all lumber camps in the north. Captain Nye has also been despatched on a similar errand on the Launch Kiora.

The new system is designed to render less difficult the task of distinguishing the logs cut on the licenses, leases, crown grants, etc., and to show which logs are eligible for export and which are not. At present the larger lumber companies are cutting on all manner of grants, leases and licenses, and mark all their logs with the same mark, no matter from which source the logs come. This causes great confusion, as the royalties and privileges vary with the various forms of leases and licenses, and the department have to largely depend on the word of the companies' employees given on affidavit as to the origin of the various classes of logs.

By the new system of letters and numbers, it will be possible not only to know who is the owner of the timber, but also to tell at a glance whether it was cut under a timber license, a lease, an old crown grant, an intermediate crown grant or a new crown grant. For instance, if the code number of a lumber company was number 6, all of its logs cut under a license would have to be marked A 6; all cut under leasehold would be marked 6A; all under an old crown grant A 6 with a crescent mark under the letters; and all on intermediate crown grants A 6 with a bar under the letters.

The markings will have to be put on the timbers at the place where the logs are cut. In this way it is expected that disputes will be avoided.

Some Important Lineshafting Points

Problems Relating to the Driving Mechanism for Woodworking Plants — Practical Suggestions for Getting Satisfactory Results

By R. A. B.

One of the most important problems we have to contend with in wood-working plants is the lineshafting, which seems to have but little consideration. In large plants, where a great number of machines are in service, shafting should be centre driven, not "end driven." One of the largest and most modern sash and door plants in this country has in the last six months twisted off two of their lineshafts. The shafting on each floor is end driven, which shows what an important point it is to install the main drive properly.

If any machine operator of long experience, or, for that matter, of short experience, were asked what occasioned the greater number of accidents in wood-working plants and what caused most delays, he would be sure to reply, "the line-shafting."

For a shaft to break by crystallization from bending, or to be torn loose by winding belts, to have pulleys or couplings come loose, is a common cause of detention and expense. The couplings are mentioned last, although if ranked as to the amount of detention and trouble they cause, they should have been named first. But whether it be couplings, pulleys, hangers or shafting, the trouble is generally with the main line. If we were to ask a manufacturer who makes shafting, whether there is any special difficulty in the way of having it safe from derangement or accident, he will answer, "Certainly not." Granting this, we have either a paradox or very bad practice, and as a paradox is rare in mechanics, the latter is the safer conclusion.

Shafts for transmitting speed and power are the oldest of mechanical appliances, and should, as we would suppose for this reason, be among the most perfect; but this is a claim to which they can by no means pretend. The great diversity of the plans for couplings, hangers and bearings by the different makers, attests the fact that the manufacture of shafting is by no means a perfected art.

There are but few places where lineshafting is so severely tried as in wood-working plants. The usually small diameter, with high speed, wide belts and the heavy duty that it generally has to perform, are conditions more or less avoided in other manufacturing establishments. Machines, when suddenly started, offer a resistance in proportion to the power employed in driving them. Measured by this rule, there are but few machines in common use so heavy to start and causing so great a strain upon the shafting, as planing machines and circular saws. There are, of course, many others that require as much power, but to include all conditions, such as the speed of the belts and the usual means of shifting them, with the sudden stopping which often occurs, there is hardly a parallel among manufacturing machinery.

A large planing machine or saw that consumes 8 to 10 h.p. to drive it, will have the belts shifted instantly from the loose to the driving pulley, and the only reason the shafting does not give way is that such machines are generally weakly driven, and the belts slip until the machine gets into motion. The same thing, in effect, occurs in overfeeding saws, so that the shafting is continually subjected to a succession of torsional strains that will soon search out bad jobs in fitting couplings or other parts.

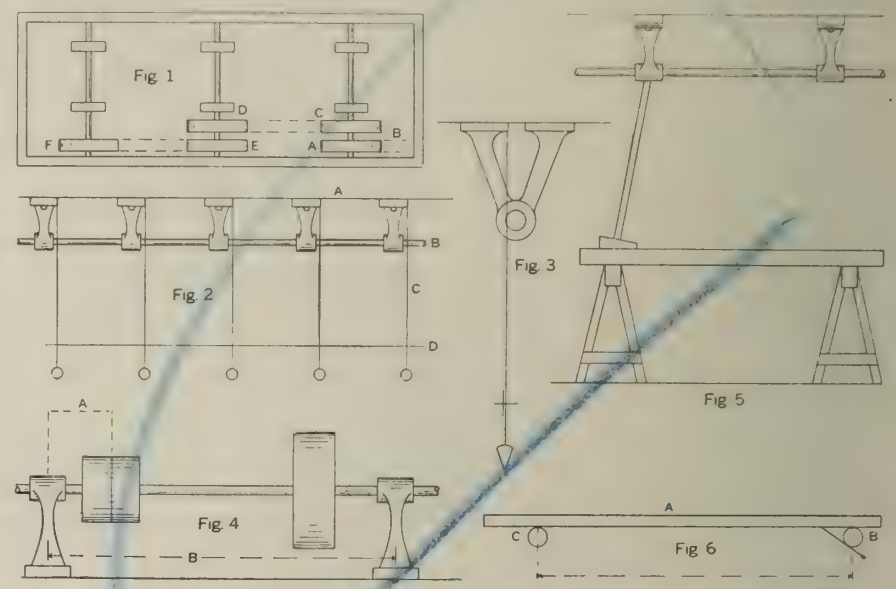
In preparing plans for a wood-working mill the shafting should, for reasons already given, go across the building whenever practicable. By connecting from one line to the other at one side of the room, the whole power is not transmitted through couplings, as in the case of one continuous shaft to drive all the machinery. The work is also divided more evenly throughout the several lines, and this does away with the supposed necessity of having the lineshafting of various diameters, which prevents the interchange of pulleys from one shaft to another, and often leads to expense and trouble. The first section of shafting carrying the main driving pulleys should have a diameter equal to one-fifth the width of the main driving belt, and be supported at each side of the main pulley; to make a rule, this section should not be more than twenty diameters long between bearings.

Fig. 1 shows a good arrangement of lineshafting for a mill 50 x 150 ft., with three cross-lines of shafting. A is the main driving pulley; B, belt to engine; C and D, second driving pulleys; E and F, third driving pulleys. Having the first or driving section 6 ft. long, and four additional sections in each line 10 ft. long, is a good arrangement for a mill of the dimensions given.

The advantages gained by this plan over that of having a continuous line or a single line running the other way of the building are, first, only a part of the power is transmitted through the couplings. Second, the speed of the different lines can be varied, and, to some extent, accommodate machines of different classes, which can be arranged with this view. Third, a part of the shafting can be stopped for repairs, or to put on belts or pulleys without stopping the entire plant; in other words, about two-thirds of the plant may be kept going in such cases. Fourth, with this arrangement the shafting can be uniform throughout, except the first or driving sections. Fifth, the machines stand lengthwise in the building, and the course of the stock is in this direction, as it should be, for it is no uncommon thing to find planing and other machines driven with twist belts.

To accomplish this, when shafting is placed the other way, it should be from 2½ to 3 in., which are the best sizes; 2½-in. shafts are as small as any should be, and they should not, without some important reason, exceed 3 in. in diameter. A line of 2½-in. shafting will run safely and well at 300 r.p.m. or a 3-in. line will run 250 r.p.m., if the bearings are properly made and it is kept in line. Pulleys should be true and balanced perfectly, no matter what their speed may be. It is never known where pulleys may have to be used, and the only safe rule is to have all pulleys carefully balanced, no matter what the speed may be at which they run.

As to couplings, they should be adjustable or compressive, not keyed or wedged, as it may be called. Adjustable couplings are now



Examples of Good Practice in Erecting and Adjusting Hangers, Shafting, Counters and Pulleys

generally used for lineshafting, and there is certainly no place where they are more required than in wood-working plants, where there is such a continual adding of machines.

Hangers that support the lineshafting should always have their bearings pivoted and adjustable vertically. The heavy loads of lumber that are piled on upper floors depress them between posts, and a lineshaft requires leveling up often. If the bearings have a vertical adjustment in the hanger frames, and are moved by screws, as they should be, it is a small matter to go along the line and level it. A hundred feet of shafting may be adjusted in this manner in an hour, if all large belts are thrown off to relieve it from strain, and the shafting is straight and true. The operation is so simple and generally understood that it needs little explanation.

Shafting is not liable to get out of line horizontally, unless from the strain of belts; it is, however, well to line up as often as twice a year, to be sure that all is right. It has been in times past a common thing to allow a shaft to run as long as it would go without adjusting, then stop the works for a day or two to "line up," which is unnecessary and only a loss of time. A shaft may be leveled by almost any one when the hangers are properly made, and it may be done at noon, or after stopping in the evening, without interfering with working time.

To line a shaft horizontally is but little trouble if the bearings or hangers can be moved in that direction. Suspended hangers should have the bolt holes slotted for an inch or more for movement, and post hangers should have movable bearings that permit side adjustment. Assuming that there is some means of moving the shaft horizontally, a good plan of adjusting it is by suspending a number of plumb lines that will bear against one side of the shaft and reach

down low enough to be sighted from the floor, as shown in Figs. 2 and 3.

A is the ceiling, to which the hangers are bolted; B, the lineshaft; C, plumb lines resting against the shaft near the bearings; D, a horizontal line stretched below the shaft, or, for greater accuracy, a strong line may be stretched about 5 ft. from the floor, as at D, to gauge the plumb lines from. This lower line, at the beginning, should set within ⅛-in. of the two plumb lines at the ends, and the rest can then be adjusted to the same position by moving the bearings; or the end bearings can also be adjusted, as the case may require. A ball of strong packing thread and half a dozen or more old bolt nuts for the plumb lines, make an outfit, and the job can be executed with but little expense or time, if the hangers are properly made.

Work of this class must be to a great extent a matter of judgment. Any one who depends wholly upon what he may have seen done or has been instructed, will not be as successful in millwrighting as if he proceeds boldly, using his own judgment as to plans, and considering the work thoroughly before beginning it.

There are many ways of adjusting lineshafting, some of them tedious and expensive. The one suggested is the most simple that can be given, and is accurate enough for all practical purposes. If a machine operator, or even a regular millwright, were to be set at a job to test his judgment and abilities, there is perhaps none that could be selected better than erecting a countershaft. The ways of erecting, all of which may produce the same result in the end, are so various as to render it difficult to give rules that will be generally applicable. The advantages of the different plans can only be tested by the time required to do the work, assuming, of course, that it is to be properly done in all cases. It may require two, and often three, men a whole day to put up a countershaft, which in another case will be put up in two hours by one man, assisted only in holding and lifting.

In erecting a countershaft, first to be determined is the position of the machine to be driven, and whether the belts will be clear. When a lineshaft is crowded with pulleys it often requires great care to place the countershafts so the belts will not interfere with each other. It is no uncommon thing for a shaft to be put up and then discover that it interferes with others on the opposite side of the lineshaft. Care in starting is the main point, not only in putting up shafts, but in most other mechanical operations that involve calculations or accurate measurements.

Beginning with the hanger plates, these should be of good sound wood, long enough to reach from two to four joist, as the weight of the shaft and belting may require. Their thickness, as an approximate rule, should be one-fifth the drop of the hanger. When the joists are of hemlock, or harder wood, and 3 inches or more thick, almost any kind of shafting can be hung with safety on wood screws, or lag screws, as they are sometimes called, passing through the hanger plate and screwed directly into the joist. These screws should be of good size, not less than ⅝-in. in diameter in any case, and long enough to pass into the joist a distance at least equal to the thickness of the hanger plate. A plate 3 in. thick requires, with cast iron washers, screws that are 7 in. long; if one in each joist, ⅞-in. diameter; if two in each joist, ¾-in.; or ⅝-in. will do for ordinary countershafts.

Having the hanger plates ready, next mount the shaft in the hangers and invert them on the floor, as Fig. 4. After setting the shaft to see that the bearings are not cramped and the hangers stand fair on their base, measure between the bolt holes accurately; or, what is better, cut a short strip of wood to the length between the centres, marked B in the figure.

If the shaft is to be placed to suit some pulley on the line shaft, measure from centre of hanger next to the loose pulley, the distance to centre between the tight and loose pulleys; this should also be marked on the stick, as the base for the position of the shaft. We will term it driving belt line, marked B in Fig. 4. This belt line must then be determined and scribed on the joist; it is easily found from a pulley, or by measuring from a wall or girder that crosses the lineshaft at right angles.

Next, placing the measuring stick, set out at each end for the bolts or lag screws that are to hold the hanger plates, bore the hanger plates and screw them up at one end, but not hard against the joist. Leave one-half inch or more for packing when levelling up. Then set the plates at right angles across the joist and mark the position of joists so as to bore through the plates for the other screws, which can be done by swinging the plates around and without taking them down. Again set the plates across the joist as accurately as possible by means of a carpenter's steel square, and mark the place for holes in joist for the remaining wood screws. In screwing up the plates they can be brought level by furrowing down on their top, with pieces of wood split in two or notched to accommodate the wood screws.

To mount the hangers, if they have pivot bearings, as all ought to have, bore through the hanger plate for one bolt by measurement. No great accuracy is required unless the shaft has to come laterally to a particular line, which is seldom the case. Screw up one hanger with a through bolt, then remove pulleys from shaft, put it in the hangers, propping the loose one with a brace resting on the floor or stage, as shown in Fig. 5.

For the next operation procure a pole or strip of wood, as A, Fig. 6, long enough to reach from countershaft to lineshaft at B, and extend to countershaft at C. By moving alternately from one end of the countershaft to the other, and driving the loose hanger to adjust it, a parallel is obtained much truer than by lines and measurement, and in one-tenth the time.

The pole can be marked at the centres of countershaft at each trial until the ends correspond. Then bore the remaining holes for the hanger bolts, put pulleys on shaft, and mount the whole in place. Level the shaft by means of a spirit level or a plumb line alongside the pulleys, which, if they are at all true, will be found accurate enough. The work is now finished, and there is a question as to which is the greatest labor, to erect a shaft or to describe the operation. With a good pair of trestles at hand, lag screws and hanger plates ready, an ordinary countershaft for belts 3 to 6 in. wide should be put up in from one to two hours' time, by one man and an assistant. The time of erecting and the accuracy with which a shaft can be set, as well as the facility with which it can be kept in line, depend greatly upon how the hangers are made.

All bearings in wood-working establishments should be pivoted. The depression of floors which takes place is continually altering the bearings in a greater or less degree, and if rigid they are spoiled by the least change. Such judgment is not required at low speeds, but when shafts carrying heavy strained belts have a speed of 750 r.p.m. or more, every precaution must be observed to have them run without heating. If the bearings are pivoted and arranged to be adjusted vertically, it is but little trouble to keep shafts level. The bolt holes in the hanger plate, if slotted to allow for horizontal adjustment, will answer for pendant hangers, without having the bearings movable laterally in the brackets. The transverse strength of the brackets should be sufficient to break the belts; if not, there is always danger of the whole being torn down by winding belts, and, as these are generally much stronger than are used in other shops, the hangers should be made accordingly.—The Woodworker.

Systematic Methods in U.S. Consular Office

During a recent visit to the city of Quebec the Editor of the Canada Lumberman had the pleasure of visiting the office of Mr. Gebhart Willrich, United States Consul, at that city. Among his other duties Mr. Willrich pays particular attention to the collection and preparation of statistics relating to the lumber trade. On account of the extensive exports of lumber to the United States from the city of Quebec this work is of much importance and the information which Mr. Willrich secures is of great interest to lumbermen of Quebec Province. His reports are published in the Daily Consular & Trade Reports, which are issued by the Bureau of Manufactures at Washington. In order to handle such an extensive work, Mr. Willrich has devised and put into effect a unique and practical system of filing all his correspondence and statistics. By means of this system he has at his finger ends, not only all available recent information, but information regarding trade in previous years for a number of years back. Mr. Willrich takes great pride in this feature of his work and it was a distinct pleasure to the editor of the Canada Lumberman to have the interesting system adopted by Mr. Willrich explained to him in detail.

The Tool Room

In these days all up-to-date mills recognize the value of a fully equipped tool room placed in the hands of a really competent man, who is made answerable for the proper equipment and perfect condition of all cutting tools; and there is no doubt when this plan is properly carried out, the result is a larger output of better quality, with a considerable saving in power and time. It cannot be too frequently urged that the tool room is really the most important department in a mill, and any reasonable outlay in this connection is soon amply repaid. In addition to a full equipment of tools for repairs, it will be found to effect a considerable saving in time and pay well in the end to provide each machine with a duplicate set of saws, cutters or chisels, as the case may be. In this case each machine should be numbered and have a peg rack or small cupboard to itself in the tool room, and as the saw becomes dull all the operator has to do is to take it to the tool room for resharpening, and obtain a fresh saw from his peg, thus practically saving a large amount of stoppages of the machines.—Timber Trades Journal.

Death of a Prominent Ottawa Lumberman

The Late John Gilmour, Ottawa

The death occurred on July 15th last of Mr. John Gilmour, President of the well-known lumber firm of Gilmour & Hughson, of Hull, Que. At the time of his death, Mr. Gilmour was residing at his summer house at Gatineau Mills, Que. The late Mr. Gilmour came of a family which had been intimately connected with the lumber business of the Ottawa Valley for many years. His father, Mr. J. G. Gilmour, was born at South Walto, Mearns, Renfrewshire, and was one of the pioneers of the lumber industry in Canada. He was succeeded by his son, who not only continued the business with success, but extended it, until it became one of the most important manufacturing concerns in the Ottawa Valley. The firm now have a number of important sawmills, chief among which may be mentioned those at Trenton, Hull, and on the North Nation and Blanche Rivers in Quebec Province. At the time of his death Mr. Gilmour was in his sixty-third year. He is survived by a widow and six sons.

R. Laidlaw Company's Successful Picnic

A good base ball game, numerous races and a jolly good time were the features of the annual picnic of the R. Laidlaw Lumber Company, of Toronto, which was held on Saturday, June 20th last, at Queenston Heights, Ont. About 600 of the employees, their families and friends journeyed over to the historic Canadian battle ground on board the steamers Chicora, and Cayuga. Many well-known lumbermen, of Toronto, who are connected with the firm, took part, among them being Charlie McBeth, manager of the west-end yard; Mr. A. E. Eckardt, sales manager; Mr. Jack Storey, Mr. W. C. Irvine, of Gibson, MacCormick & Irvine, Toronto Junction, and a number of other well-known lumbermen. Upon the arrival of the boats at Queenston Heights. The first number on the pro- picnicers to Queenston Heights. The first number on the programme was a ball game, between the East-end and Spadina Yards and the North and West end yards, after an interesting struggle in which the individual members of the teams distinguished themselves greately, the East end and Spadina men were declared the victors.

After lunch, Mr. Alex. Gordon took charge of the proceedings. Alex. is known as one of the best managers of sports in Ontario and he added fresh laurels to the many he has already gained by the way he conducted the games. The races were many and varied, some of them being very funny. One young lady claimed that Mr. Gordon had not acted fairly with her in starting, and she forthwith challenged him to a 100 yards race. Although getting on in years and incidentally in weight, Mr. Gordon took up the challenge, and bravely started out on the long grind. The young lady was too good for him, however, and beat him out about 10 yards.

After the games Mr. Eckardt and Mr. Gordon distributed the prizes which consisted of an excellent assortment, including umbrellas, fishing rods and other attractive articles. The winners of the ladies' races were presented with hand bags and hammered brass ware.

The return trip, which was made on the eight o'clock boat, was enjoyed by all, although, owing to the large crowd on board an excellent musical programme, which had been arranged for the occasion, could not be given.

Two pipers in full Higland costume accompanied the picnicers and enlivened the occasion with many Scotch airs. The company's yards and factories in Toronto were closed for the day.

New Technical Periodical

Steam Machinery, a monthly magazine of men, machinery and methods, intended especially for the contractor, the railroad-builder and the excavator, will commence publication before the end of this year.

The magazine will contain departments devoted exclusively to each of the above, and will publish therein articles of interest to those engaged in these various lines. Contributions of a technical or amusing nature are invited on anything pertaining to the above. All articles submitted must be in typescript and accompanied by a stamped addressed envelope for return in case of non-acceptance. All articles submitted will be accepted or rejected within a month from the date of receipt.

Accepted articles will be paid for immediately after publication, not at a word rate, but at a rate determined by their interest and value and by the originality of the thought contained in them. The magazine will be edited, for the Clyde Iron Works of Duluth, (Minn.), by Charles H. Mackintosh, to whom all articles should be submitted.

R. A. Rastall Appointed Vicegerent for Eastern Canada

Mr. R. A. Rastall, the well-known Toronto lumber dealer, has been appointed Vicegerent Snark of the Concatenated Order of Hoo-Hoo for Eastern Cahada. Mr. Rastall is widely known to the lumber trade in Toronto, and in fact throughout Ontario, he is senior partner in the firm of R. A. Rastall Company, Mr. W. Boake being his associate partner.

Mr. Rastall is a hard worker and will no doubt be a great factor in promoting the welfare of the order in Ontario. It is earnestly hoped that every member of Hoo-Hoo throughout Ontario will do all in his power to assist Mr. Rastall.

Personal News and Trade Notes

H. Parker, Parkerville, Ont., has erected a new sawmill with a capacity of about 10,000 feet per day. Parkerville is about thirteen miles from Bracebridge, Ont.

Mr. S. W. Rogers, of the forestry staff of James W. Sewall, forester and surveyor, Old Town, Maine, has gone into Northern Maine on a short exploration trip. Mr. Rogers has lately returned from a cruising trip of several months in North Carolina.

The Meaford Lumber Company, of Meaford, Ont., are a comparatively new wholesale lumber firm, having started business the first of this year, specializing in hardwoods and hemlock. The manager, Mr. R. C. Jamieson, is a lumberman of twenty-six years standing, having for the past nine years been in the employ of the Seaman Kent Company at Meaford.

Mr. John H. Marr, of the Govan Sawmills, Scotland, is on a business visit to Canada. He arrived in Montreal, and has visited several mills in the Maritime Provinces with the object of securing supplies of ends for making packing cases. There is a shortage of this description of timber in Scotland, and Mr. Marr is desirous of securing a continuous supply.

Mr. R. H. Campbell, Director of the Forestry Branch of the Department of the Interior, has left on a trip to Western Canada, where he will investigate the progress of work on the establishment of look-out towers and telephone systems on forest reserves, which was commenced this year to permit the foresters to get the earliest information of fires and to take immediate steps to check them.

A. C. Todd Moves to Edmonton

Meaford, Ont., is to lose an industry that has been operating there for over thirty years. In the spring floods of the past season the tannery and shoe-pack factory of A. C. Todd were completely swept away, and Mr. Todd has decided to make the west his base of future operations. In South Edmonton a new company has been formed capitalized at $100,000, with Mr. Todd as president and general manager, and by November the many users of "Polar Bear" Shoepacks and the oil-tanned leather which has made the name of Todd so well known throughout the country, will be able to procure these brands once more. The new factory will be on a far bigger scale, built to take care of the rapidly increasing business in the West.

A Splendid Financial Statement

The financial statement of the Lumber Mutual Fire Insurance Company, of Boston, for the year ending June 30, 1912, shows them to be in a flourishing condition. There is a net cash surplus shown of $525,546.87, with total assets of $1,960,875.75. Dividends paid to policy holders amounted to $84,502.19 and losses to $66,500.85. The gain in the net cash surplus was $53,558.95. The total losses paid to policy holders to date amounted to $959,588.74, and total dividends to date are $883,668.22.

The sawmill of the Dorchester Lumber Company, St. Malachie, Que., valued at $35,000, was destroyed by fire on July 23rd last. Mr. L. Lacasse, the manager, states that the loss is covered by insurance, and that the mill will be rebuilt at once.

The plant of the Western Paper Company, which was recently constructed at New Westminster, B.C., at a cost of $250,000, and which started operation on first of June, has been forced to run night and day since its opening. Even now, with an output of fifteen tons daily, the demand exceeds the supply.

THE WOODWORKER

System vs No System in Furniture Factories

By Julius Bradley

The subject of system in the furniture factory is one that will bear discussion, for in a good many plants it is very conspicuous by its absence, in spite of the fact that competition is becoming keener every day and the only sure way to meet it is to have a system throughout the factory whereby each workman will have a certain part to do and do it in such way that a record of it may be had. These records are very valuable to the firm if they are obtained in such way as to be reliable.

The difference between a factory with a good system and one with no system at all, can be plainly seen by one who is familiar with furniture factories in just passing through; in fact, evidence of it can be seen in the office, before entering the factory. It has been the writer's privilege to have considerable experience in both kinds of factories, and I will endeavor to explain some of the advantages of the one, as well as point out the disadvantages of the other.

In a good many plants where system is a lost art, the cause is not in the factory foreman or the heads of the different departments, but is the fault of a manager who is either trying to do more than a manager's duties, by going out in the factory and directing the work in detail, or has not sufficient confidence in his foreman, and no judgment as to what can be turned out in a given time.

Now, as to the manager directing the details of the work, this is most prevalent in plants that are always "balled up," The manager goes through the plant probably twice a day, and very often gets the foreman in tow, and the outcome is nothing more or less than an excursion of fault-finding. If they come across a machine that is temporarily out of commission for repairs, there is a big powwow about it, and the manager is apparently dumfounded to think an operator would be so careless as to let a machine get to a stage where it needed repairs. If a man should be found repairing a belt, there is an investigation started at once, and nine times out of ten the operator will blame the belt-shifter or find some other imaginary cause for the belt breaking, when in reality it was only a worn-out lace, whereupon the manager opens up on the foreman for not seeing that the cause was remedied before the damage was done.

After making his rounds and disposing of his surplus sarcasm and abuse, he inquires about certain jobs, and if found to be sidetracked in order to rush some other job, he gives orders for certain men to start on them at once, regardless of what state other work is left in. After a trip of this kind it keeps the formean busy to get things righted and the work moving by the time the manager is due again.

There are really two kinds of these managers who butt in, the one kind that goes to the men and gives orders, and the other that worries the life out of the foreman, and neither one of them ever gets the results he is looking for. The simple reason is, they go about it in the wrong way. They don't give the foreman the consideration they should. They, as a rule, load him up with more than he can properly attend to, and he has not time left to plan his work. They forget that the factory end of the business requires brains as well as the office, and in not a few cases the lack of system in the factory is caused either by neglect or lack of brains in the office.

I have known managers to promise delivery of goods by a certain date, when they knew, or at least ought to have known, that delivery at the date they promised was an utter impossibility. Then, to try and make good their promise, they would go out into the factory and upset all the foreman's calculations in trying to get the order out. Is there any wonder that there are so many furniture factories to-day that are utterly void of system?

It is absolutely necessary for the office to lay the foundation for the system of the factory, more especially if the keeping of cost is to be of any use—and all up-to-date furniture factories know, or should know, what it costs to manufacture their product. It is very important, where special work is done, that the factory foreman be advised of what orders come in, and if it be a staple line he should be given a stock list at regular intervals. What I mean by stock list is a list of the orders issued to the factory; also, what goods are in process and what are in stock. This enables the factory foreman to get the different jobs that are wanted moving along without any interruption of other work, or at least without monopolizing the whole plant, as is sometimes the case with a rush order in the factory that never knows how the stock really is until the shipper boss reports "all gone," and then everything has to stand aside toll the "all gone" is rushed through. This state of affairs can be easily overcome if the office does its part in making and maintaining a system, and unless the office does do its part, it is next to impossible for the factory foreman to inaugurate any kind of a system that would accomplish the desired results.

We all know that the records of cost are very important and should be as nearly correct as possible, and the better the system in the factory the more reliable the records of cost will be. It is not a difficult matter for the workman to give a comparatively correct account of his day's work, if he is able to complete his part on a job without having to change on some other work. Changing from one job to another is altogether too prevalent in a good many shops, and its effect on the output, and also the reliability of the records, is most usually underestimated.

How often do we see the manager or superintendent come around and want a certain job at once, and in order to get it a number of machines have to be changed and other jobs let stand till the one wanted is put through, and after it is completed it is left stand around till long after the time it would have been ready had it went through in the regular way. This sort of thing is often far-reaching in its effect, and in a way that the manager never considered, especially if one part of the plant is to supply another—and that is really the way it should be—so we can readily see that to change the order of things in one part of the shop has its effect on the other, not only in disorganizing things, but also on the output, for time spen tin unnecessary changing is time wasted, and only adds to the cost of production.

There are times that changing machines when in the middle of a job is unavoidable. If changes are made only in case of absolute necessity, the interruption caused can be overcome by the foreman. for in the best of regulated plants there ar occasions when such has to be done. The foreman who is capable of regulating his department to the point of system, has also the ability to cope with an emergency in the form of a rush order, providing they are not so frequent as to be continually disorganizing the whole department.

A great many managers have the rush habit; that is, every time they go out into the factory they want some job rushed, not because it is wanted ahead of other jobs, but they seem to think it is a sort of stimulus, while in reality it has the opposite effect, more so with the men than with the foreman. That very significant word "rush" is like everything else, alright in its place, but when it is overworked by the manager or superintendent, becomes repulsive and loses its significance, and the manager himself becomes a sort of a joke and loses the respect and esteem of his employees.—The Wood-Worker.

Making Moldings from Saw Mill Edgings, without Ripping to Width

You ask about the new way of making stock moldings out of saw mill edgings, without ripping them to width. We have two five-headed molders, also three of the old kind—we make some molding—made by a well-known builder of wood-working machinery.

The new way especially is to make moldings out of saw mill edgings, without ripping the stock, as they come from the mill in all widths, in the same place. In the first place, it costs too much to rip them, as you have a worthless edging left, sometimes in two or more pieces, which will cost more to get through the "hog" than the piece saved by ripping is worth.

The only way to do this is with the five-headed molder, with what I call "hogging" knives on the first top head, in addition to the jointer knives, that will size the stock down to width and thickness, and sticking the mold on the second top head. Have heads with milled bits, that can be set up and sharpened on a pedestal grinder, the same as side heads are done at present, jointing them on the machine with a formed stone while in full speed, so as to have all four or six knives cutting.

Of course, this calls for a molder that has a pull-off or a pull-out arbor, for both the top and bottom heads, so as to enable the operator to take off and put on heads for different molds with very little trouble; in fact, quicker than to change the old way, saying nothing about having four or six knives cutting instead of one or two. These molders are the only ones I know of that are equipped to put on and take off different heads on both the top and bottom spindles. Top and bottom heads have pull-off box as well as pull-out arbor on all three heads, so the molder man can change heads quicker than to set up the old way. By using heads with milled bits, it is no trouble to keep the mold the same shape as long as the bits last; and, being made of high-speed steel, they will last longer than any common knife.

Just to see how much they would stand, have run a 1¼ x 4 down to one piece of 13/16, quarter-round, without checking up to the feed. Would have done more, but the "hogging" knives were not

any wider than for a 4-in. strip. They will stand all the feed you can get the men to handle. Another good thing for the five-headed molder is, in sticking heavy hardwood molds you can take part of the cut on the first top head and finish up on the second one.

We still have the old four-sided slotted head, but it is a self-centering one, which is as essential as on a side head on the fast-feed matchers, as of old; in fact, it is as necessary to have the square head, as well as the others, to take care of detail or odd work, which you have more or less, and I believe the coming way of making stock moldings will be with machines and heads as described above.

The man who wants to stick moldings with faster feed will have to use heads with more knives, and joint them to do smooth work. The only way I see to do this is to have heads to change instead of changing bits—heads to be kept up in the tool room.—C. W. Heath in the Wood-Worker.

A Little Talk on Designing Details

By Chas. Cloukey

One of the most important things about mill work now-a-days is the correct and economical detailing of the work to be made. So much of it is special material, specified by architects, that the stock patterns of the mill cannot be used, making it necessary to use the details of the architect, if he has shirked this part of his duties, as he often does.

It is not always a bad thing for the mill that the architect fails to furnish full-sized or even scale details, for it is frequently the

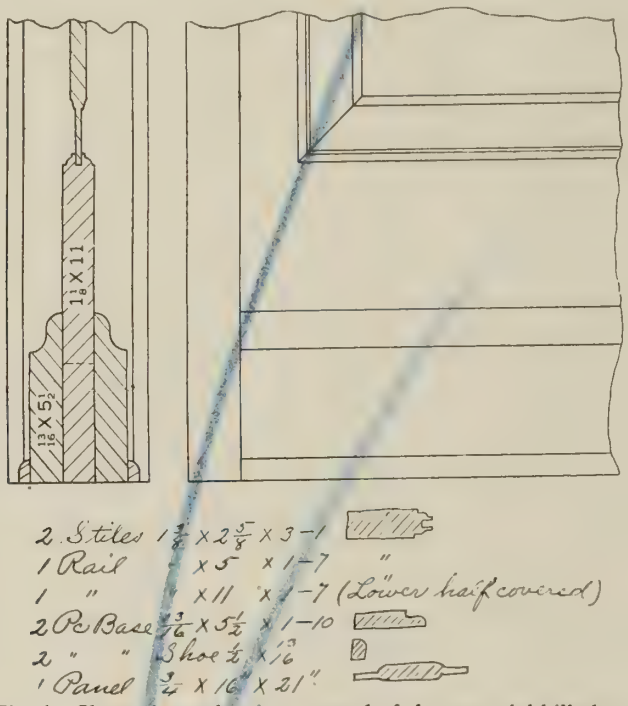


Fig. 1—Shows just what is expected of the material billed out

case that the factory draughsman is able to make up a set of details which looks as well or better than the designs of the architect, and at the same time costs much less on account of the mill man knowing what he has in both knives and lumber.

One of the things to be avoided in designing details is the expense of making molder and shaper knives, unless it is absolutely necessary, for this is one of the acute expenses of the custom or odd work shop. Another thing to be kept in mind in designing and detailing is to keep within the standard sizes as much as possible, except in the hardwoods, where it generally takes about an inch in width to straighten up the stock for long jambs, casings, baseboards and the like. One can get a 5¼-in. jamb out of a 6-in. board if it is not too crooked, but to get a full 6-in. head casing requires an 8-in. board. If the lumber to be used is quarter-sawed, it is liable to be badly curved edgewise in the drying, and so show a great deal more waste in getting out long stuff than the flat-grained lumber.

Perhaps the function of details is as important in getting out the stock or cutting as it is in finishing or putting the work together, but the value of details in this respect depends largely upon the way the cutting bills are made, and the means furnished the yard man and the cutter to identify the items and to show the extent to which defects in the lumber may be used.

It is surely flying in the face of Providence now-a-days to bill out so many pieces so thick, so wide and so long without any qualifying remarks, unless the stuff has to be absolutely clear. And when specifying the grade from which the pieces are to be cut it is well to add any pertinent information which the bill will carry without becoming confused.

Fig. 1 is intended to illustrate a class of details which show both the yard man and the cutter, as well as all subsequent workmen, just what is expected of the material billed out. It shows that the bottom rail of this panel work is covered on both sides at the bottom for half of its width, but that the top half must be clear on both sides. It shows that two pieces of base may have defects on one side which will not work out in the ogee at the top, and that a small defect on the face side at the bottom edge will be covered by the shoe at the floor. It shows that the panel frame has a solid sticking, and therefore must be clear on the face edges, and that the panel shows both sides and is raised on both sides. The sketches in the bill serve to identify each piece as a constituent part of the

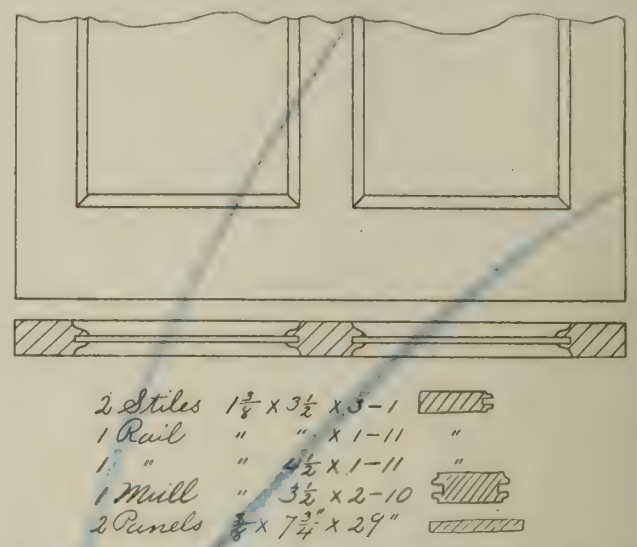

Fig. 2—Cross-section and part elevation of cupboard door

panel work shown, and any workman of a little experience will soon see the significance of using just as poor lumber as he is able instead of the best he can find.

Of course, I am not saying that the yard man and cutter should both spend valuable time in trying to see just how mean stuff they can work into a good job, but the point is that they might spend valuable time in trying to find clear stuff to make the 11-in. bottom rails when the proper stuff lay ready to their hands if they only knew that half of it was to be covered.

I have had very proper stuff sent back to the mill by the owner of a fine residence because he did not understand that the defects in the pieces were to be covered by other members of the finish. The same pieces were sent out the second time, when the owner was out, and, of course, he never saw the defects in them again.

In Fig. 2 is shown a cross-section and partial elevation of a cupboard door, with the piece bill below. Generally speaking, it is not necessary to detail this class of work in the mill, as the men became accustomed to a shop style, and it is only necessary to mention if the work is for paint or for oil finish, and the style of sticking re-

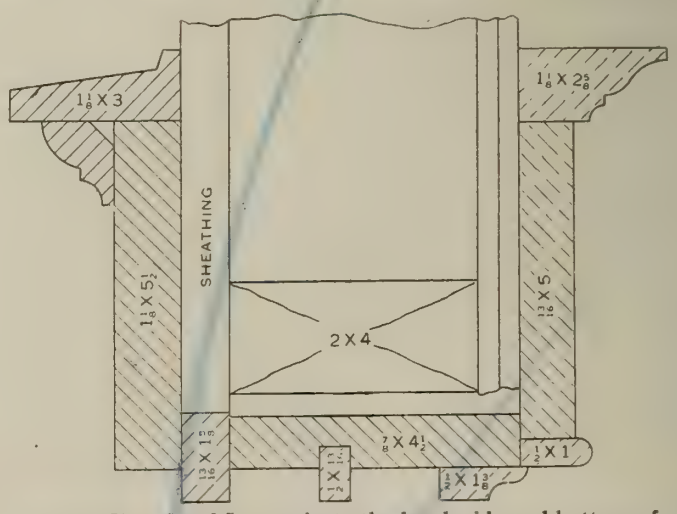

Fig. 3—This, with Figs. 4 and 5, constitute the head, side and bottom of a window frame for a frame building

quired. If the style is special and the sticking of a detailed pattern, then a drawing something like the figure is a real help.

A great deal can be accomplished through the little rough sketches following the items on the cutting bills, and if they are made with some pains, will show the style of sticking, whether the pieces are for stiles and rails or millions, and whether grooved, rabbeted or stuck square like the frames for cupboard fronts.

Bill marked "see detail" should be accompanied by a copy of the detail, and if it is expedient that more than one department use the same detail at the same time, there should be trackings made of it and furnished to each department, so that the work may go forward simultaneously to its completion.

Some foremen give out detached details when it is just as easy to give the group in their respective positions, and so give each work-

man an insight into the way the work is put together, and teach them to read working drawings. It is an easy step from the full-sized details to the smaller scale drawings, and then on down to the blueprint plans. If every man about a planing mill could read plans correctly, none of them would be any poorer workmen than they are, and a whole lot of them would be more efficient and thereby more valuable to the company and to themselves.

Figs. 3, 4 and 5 are given as an example of the grouping of details, and constitute the head, side and bottom of a window frame

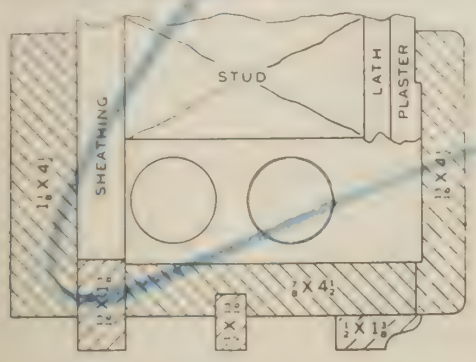

Fig 4

for a frame building. The details tell this and all the other information necessary, except the size of the window and the class of material from which the frame is to be cut.

It will be noted that the inside trim is given a different shading than that of the frame proper, and is not billed out at the time of making the frame. The idea of drawing it in with the frame is to show the opening as a whole and the relation each piece bears to its neighbors, as well as the way the frame members into the wall of the building. This is a great help in billing out the interior finish and in matching up the work at any future time. As in the example of Fig. 1, the detail shows the parts exposed, so that the pieces required need come up to the specified grade only on the exposed parts.

Fig. 6 shows one of a class of details in which it is good practice to number or letter the different members. These are really "sub-details" or the detailed details, and occur where it is necessary to make up the detail proper with a set of separate members. The same class includes veneered doors, windows, and all kinds of laminated work. The sample in the figure is a cross-section of a large bent molding, such as is used in the curves of church ceilings and groins. The several members are run separately on the molder and then bent and nailed in place one upon the other. It will be seen by the detail that only the edges of most of the members need b clear, so that the whole is strong enough to bend and nail.

The high price of clear lumber of any kind makes it almost prohibitive language to talk about clear finish for the outside of a building or for any work to be covered with paint. For this reason we exercise all the ingenuity at our command to conceal the defects in finish lumber, and to show a clear face, no matter what the back may contain.

The changing or altering of details is another of the mill man's resources, of no mean value when worked with tact as well as in-

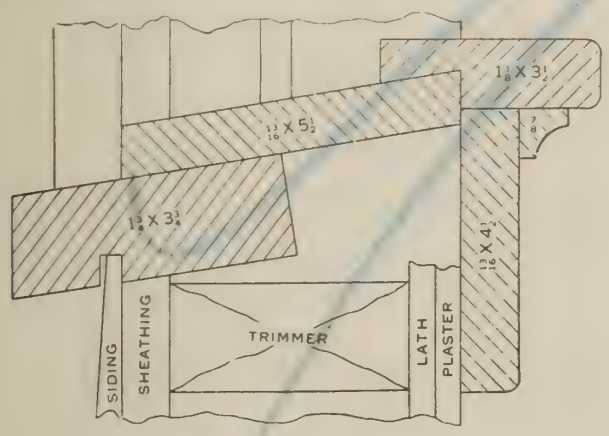

Fig. 5

genuity. In the first place, if the mill superintendent will take pains to keep the architect in a good humor and help him out of some of the corners he is bound to find himself in occasionally, he can nearly always secure permission to make minor changes in details to correspond with stock material or knives on hand. It is a rare case indeed where the owner would ever see or know the difference in detail, and, in case he did, would as likely as not prefer the change.

Perhaps the most perplexing thing about details is the system, or rather lack of system, for filing details after they have been worked through a job. They may be collected and rolled up with the blueprints and filed in that manner, if the plans are not called in by the architect, but in the odd-work mill there are a multitude of details accumulating as the weeks go by, and are of such a nature as to preclude filing with the bills. About the only practical method I know of is to follow the same plan as in filing bills by the vertical alphabetical system, except that the index and folders should be much larger than for the cutting bills, and then it would be necessary to fold up the larger details into a compact compass, which would be neatly contained in the folder without obscuring the index.

Of course, all details should be marked with the name of the customer, the serial number of the order and the sheet number of the cutting bill. This will at once identify them and enable one to find the details from the cutting bill or to find the cutting bill from

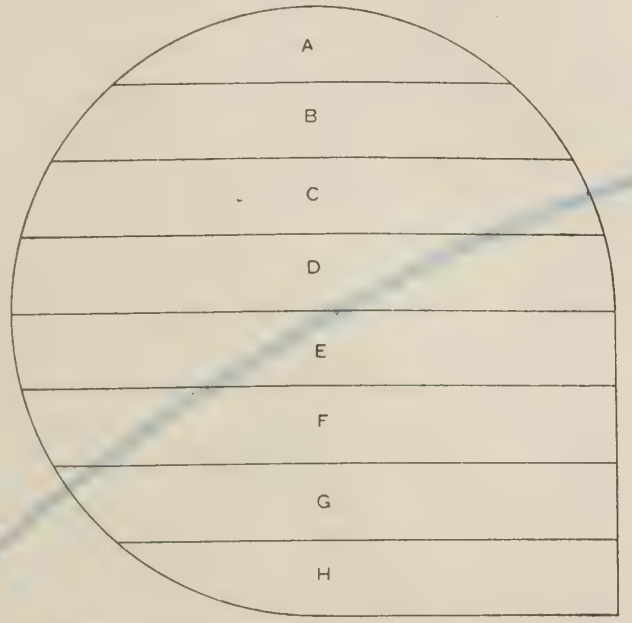

Fig. 6—One of a class of details in which it is good practice to letter or number the different members

the detail sheet. It also enables the office to find the cost of any particular detailed piece of work, provided the shop is working a cost system.

When details for odd work are small enough, they should be put directly on the cutting bill, which at once solves the question of preserving the same for future reference.—The Wood-Worker.

Veneer Factory Costs

"Veneer Factory Costs" was the title of a paper read by F. C. Rice at a recent annual meeting of the National Veneer and Panel Manufacturers' Association.

The chief element of "veneer factory costs," he said, is the labor and logs, but the other expenditures must not be overlooked. To obtain the cost of labor is naturally a comparatively simple matter, the time being kept by the foreman, who turns it into the office every morning, together with the drag sawyer's report with the different kinds of woods, also the clipper's report, which shows the time spent on each order, and the number of pieces of veneer and their dimensions handled during the day. These reports are carefully checked by the bookkeeper and entered on the monthly statement of the cost of logs, labor involved and the selling price of veneer manufactured per day. At the end of the month these particulars are totalled and at the same time show a brief statement that will be of real value as a daily guilde.

We think it desirable wherever possible to introduce the piece work system of paying labor, the opportunities for "holding back" on the output being so great and the capacities of the different men varying so widely that payment by results is the only just method for both workman and employer. If a fair rate is adopted and notice given that no cut will be made on account of increased production, which will be an inducement for the men to put forth their best efforts, and the more this can be worked out the easier it will be to arrive at the actual cost figures. The cost of veneer varies on the different kinds of woods used by the manufacturer. We should be able to manufacture maple and beech veneers for less money than our neighbor in the south, and they, on the other hand, manufacture gum veneer much cheaper than we can. For instance, it makes some difference whether you have to cut logs that measure on an average of 20 inches in diameter or if you have logs 20 feet in diameter, which I imagine some of our gum neighbors must have, judging from the prices some of them sell their product at. It seems to me that the manufacturing cost of veneer depends entirely on the location of the plant and kinds of wood used.

The labor and material cost having been obtained, are now added together to give the total "manufacturing cost." The factory expense and overhead burden are next to be considered. If figures are obtainable for previous periods the estimate of these costs may

be based thereon, but the result obtainable should be carefully compared with actual expenditures to obtain accurate estimates, such as repairs and depreciation of plant, involving capital expenditure and superintendence.

In our plant it would be practically impossible to arrive at the actual costs, as we are cutting all kinds of wood, and thick and thin stock from the same logs, and the only figures I am in position to give are these: For the labor, factory expense an doverhead burden it costs us $60 per day to operate the plant, and up to the last three months the plant had never paid. However, we have since, with a little hard work and much good fortune, been able to make $1,000 profit from the business.

Locating and Erecting Wood-Working Plants

By A. T. D.

The question of location requires much consideration. Many large manufacturing plants are now locating in small cities. There are advantages and disadvantages in this. Many towns are offering substantial bonuses to manufacturers, also building sites free of charge. It is needless to say that many of these towns furnish most excellent shipping facilities, and when one locates near a large city there is very little, if any, difference in incoming freight. In small cities labor is cheaper and the workmen are more contented. It must, however, be admitted that skilled labor is more easily obtained on short notice in large cities.

The prime motive in the construction of a new factory plant should be efficiency, and this certainly should be the principal consideration in working out the scheme. Much attention should be given to the possible efficiency of machinery and labor-saving devices, but these fall short of their possibilities unless they are made integral and co-ordinated features of a plan of production that has for its object the minimum handling of material (whether raw, in process, or finished), the maximum substitution of mechanical operations for human labor, and the multiplication of time-saving devices.

The factors most largely affecting the greatest economy in production and marketing are, of course, location with respect to supplies of labor and raw material, power transportation, market, permanence of both methods and materials of construction, and means for protecting and preserving the plant when once completed.

It is important that as much floor space as possible should be visible at all times, hence all angles should be aboided in favor of the plain rectangle. The same considerations of visibility and the avoidance of unnecessary walking or elevator riding, argue for the single-floored structure as against multi-floored buildings.

In designing a factory plant, the most important consideration is the natude of the product and the process involved in its manufacture. "A building or collection of buildings designed to house certain productive activities, is not likely to prove at all efficient if used for a widely different purpose. It is true that many existing plants are operating under just such indefensible conditions, but that proves nothing as to bigger profits under better conditions."

It may be well to state that passages in the factory must be wide enough to permit the passage of two trucks in the aisles, and for the side-tracking of trucks around machines. Keep stock on trucks, not on the floor. A very good scheme is for the superintendent to count the trucks on the floors of the different departments, recording this count, together with the kind of material, lot number, etc., that each truck contains. In our factory every truck bears a number; the number of the truck can therefore be readily recorded on the truck tally. A good truck system involves the retention of the material on the trucks, and with as little hauling of empties as possible, an important feature, and one deserving attention in every wood-working plant.

Lumber should be handled only once from car to factory. The yard should be so tracked that original trucks on which the lumber is piled from the car can be taken to the kiln, from there to the lumber sheds, etc. It is a good plan to lay out the lumber yard in such a way that all the trucks have a slight grade towards the mill, the lowest point being the foot of the incline leading to the cut-off department.

A well-known piano company has an ideal method of handling lumber, of which it usually carries over 1,000,000 feet. The storage sheds and the kilns are laid out in such manner that the lumber is handled but once. It is loaded from the car into the trucks. These trucks, moving on special trackage, are run into the storage sheds, where the ends of the lumber are coated with a preparation that prevents splitting or cracking. From the storage sheds the lumber is run into the drying and seasoning kilns, on the same truck on which it was first loaded, then into the factory. Having an immense stock to draw from reduces the chances of cracking and warping to a minimum.

A lumber yard must be complete and well equipped to economically store and handle lumber. The expense involved in laying out a yard and installing the necessary tracks and pavements is more than compensated for by the saving in the handling of the stock, Direct such a question to a manufacturer who is handling his stock by an up-to-date system, and you will, I am certain ,not find one who regrets the investment and does not find it profitable.

The most modern, and perhaps the best, style of dry kiln is the moist-air condensing kiln. Continuous kilns are satisfactory if properly handled, but involve the problem of having more humidity at one end of the chamber than there is at the other end. As the lumber gets dryer and advances to the out end, the amount of humidity required is less; as the reader can readily see, the proposition of having air in one end of a room much more moist than at the other end, is quite a difficult one, and if the lumber is not carefully watched, checking and honeycombing are quite likely to result.

Waste is sold by some manufacturers for from $1 to $3 per load. The writer visited a very large factory in a neighboring state a few weeks ago, and was astonished to find that it sells its waste lumber at (if I remember correctly) $1.40 per load, which includes delivery. It may be safe to state that 80 per cent. of lumber waste is burned at the plant or sold as firewood. Most of this waste can be turned into some marketable form and profits realized therefrom. Many manufacturers can make use of considerable of this waste in their business if they will but give the question some study. We have found several places in our plant where we can work up a good portion of waste to good advantage.

A poorly-constructed shaving and dust-collector system, or an inefficient fan, lessens the profits of any wood-working concern. The loss by air friction in a badly-designed collector system is enormous. When installing a system of this kind it certainly pays to install the best obtainable. The question of power required to operate the blower is also of the utmost importance. Slow-speed, low-power exhaust fans are now being introduced, and it is claimed that this type of machine will handle more material with less power and at less speed, than the old-style exhausters.

Factory floors are often responsible for much discomfort. The wood floor is the only one that is conducive to comfort, since wood is a poor conductor of heat. Hard maple flooring is commonly used in factories. The best floors for factories are constructed of 3-in. yellow pine, grooved on both sides and with separate tongues.. The separate tongue makes it possible to take up and remove or repair the floor with very little waste. This yellow pine floor is next covered with a sound-deadener of tarred paper, and on top of this is placed the surfacing of ¾-in. hard maple. Considerable attention should be paid to the condition of the floors. Slippery floors constitute an element of danger, especially in conjunction with unguarded machinery. And even where a slippery floor is not in proximity to an unguarded machine, it may yet cause a bad fall, resulting in serious injury. This is likely to be the case where workmen are engaged in carrying heavy material.

Pure air is one of the chief elements of industrial efficiency, as it is of individual health and happiness. The chief factors in air are temperature and humidity. Heat, and particularly heat combined with excessive humidity, is the one condition in air that has been proved beyond a doubt to be universally a cause of discomfort, inefficiency and disease. It may interest some of the readers of this paper to learn that common air is a fluid composed mainly of two gases, in certain proportions, namely, oxygen as twenty and nitrogen as eighty parts in a hundred, with a minute addition of carbonic acid gas. Such is air in its pure and right state, and such is the state in which we require it for respiration. When it is loaded with any admixture of a different kind, or its natural proportions are in any way deranged, it cannot be breathed without producing injurious results. We also require what it apt to be a large quantity of this element of healthy existence. We were taught at the grammar schools that our breath, when we draw it in, consists of the ingredients formerly mentioned, but that it is in a very different state when we part with

it, and that in place of the oxygen which we consume, we exhale an equal volume of carbonic acid gas. Carbonic acid gas in a larger proportion than that in which it is found in the atmosphere is noxious. The volume of it exhaled by the lungs will do not harm, but if breathed out into a close room it will render the air unfit for being again breathed. Illustration: Suppose an individual be shut up in an air-tight box. Each breath he emits throws a certain quantity of carbonic acid gas into the air, filling the box. The air is thus vitiated, and every successive inspiration is composed of worse and worse materials, till at length the oxygen is so far exhausted that it is insufficient for the support of life. He would then become sensible to great difficulty in breathing, and in a little time longer he would die.

Contrast your feelings and your effectiveness on a close, hot and muggy day. One works listlessly, and half accomplishes the task undertaken. This I know has been my experience. The depression and faintness from which workmen in many factories suffer, after being confined in a poorly ventilated room, is clearly traceable to vitiated air. Odors of glue, oils, finishing material, etc., render the air foul and stagnant, and often give rise to violent diseases among the operatives. The proper ventilation of factories consists in the warming and introducing of fresh air from without, and the discharge of unwholesome air from within. If manufacturers would provide efficient means for ventilating, the cost of construction would be repaid in better health of the workmen and the natural increase of labor.

Factories ought freely to admit the sunlight. How true it is that diseases which have baffled the skill of physicians have been known to yield when patients were removed from dark rooms to sunlight. Air is necessary for the first inspiration of our lives, but the purity and healthfulness of the atmosphere depends upon the rays of the sun. Natural light should permeate the whole shop during all hours at which it prevails out of doors, and not only work benches and machines, but stairways and all passages should be light. The degree of light should be reckoned according to the proportion between the area of the walls and the area of the windows. The area of the windows should occupy about one-third the wall area. Skylights are generally undesirable on account of their admitting so much direct sunlight, also on account of their liability to breakage of glass and obstruction by snow. Statistics show that the greatest number of accidents occur during the months of diminishing light. Dirty windows and insufficient artificial illumination often make conditions much worse than they need be. Many progressive manufacturers whitewash the walls of their factories once a year. This is a great improvement and saves much on the cost of artificial illumination.

We know that without solar light there can be no proper vegetable growth. It is equally necessary for the beauty and perfection of animal development. Does not the reader realize that the human is just as dependent for energy upon the sun's rays and streams of pure, invigorating air? Turn on the sun, Mr. Manufacturer. Let in the air, and your men will be keyed up to full capacity. Remember that gloom is the burial place of efficiency.—The Wood-Worker.

Saw Mills in India

In India there is no lack of timber or of sawmills. The former is supplied chiefly by the government forests, each of which is in charge of a conservator and a number of colored assistants, whose business it is to prevent the illegal felling of trees. These "forest officers" are exceedingly well paid; and if their lives are lonely and unhealthy, those who manage to cheat an early grave, by escaping jungle fever, intermittent fever, cholera, and other ills to which the Anglo-Indian flesh is heir, after about thirty years' service are entitled to a fat pension, which they enjoy at home, says a contributor to an American publication. It may be added that there is no country in the world in which the government timber is so well conserved as in India. The sawmills are of two kinds—those run by Europeans and those run by natives. In the first named an Englishmen acts as manager, his assistants being natives; but in the large Calcutta and Bombay mills the engineer and one or two of his assistants also are white men, the rest of the staff being made up of colored assistants, as they are called. Some native lumber magnates employ English managers, for if they have to pay more for their services they recognize that by securing good work they at least get value for their money. So slack is the colored manager and so wasteful is he with the lubricating oil, coal and other stores, that the wonder is the mill manager contrives to show a profit.

When an accident or a fire occurs in a European or a native mill, the colored employees, whether half-castes or natives, are almost certain to be useless. It may be added that in the case of a fire in a native mill the loss is not likely to be very great, for the proprietor's curiously false economy has prompted him to invest in a second-hand boiler, which probably has been condemned by the government boiler inspector, while it is probable that the engine, the machinery, and the other accessories are not worth much more than the price of scrap iron. The wonder is that they do not give out the first time they are tried. In some European mills, on the other hand, the most up-to-date appliances are to be found. At the same time it must be confessed that in many of these establishments labor-saving devices do not find favor with the white manager, who has been so many years in India that his thoughts have become Indianized. As to the natives in his employ, they hate the idea of an innovation which tends to reduce the number of hands figuring on the pay sheet.

Luckily for the sawmill man, there is a strong demand for timber, particularly in Calcutta, Bombay and Madras, where the shipbuilding industry flourishes. "Up country," in the stations where the railway shops are situated, it is also in request, unless the superintendent of the shops finds it to his advantage to obtain the lumber direct from the forest and to have it sawn on the premises. Yet, in spite of all his troubles, the sawmill proprietor usually manages to make a decent living, even if he does not put away rupees for the proverbial rainy day. It sometimes happens that the native lumberman, hoping against hope, endeavors to win over the superintendent, by means of a bribe or with cajolery. In the former case he waylays him and asks point blank what amount will alter his decision, or begs his acceptance of a box of cheroots, at the bottom of which a roll of bank-notes is to be found. But if he is afraid of getting his neck broken, or of offering too small a bribe, he composes a letter in the quaintest English imaginable, believing fully that it will warm the heart of his oppressor. Fortunately for the "luckri wallah," he does not depend for his livelihood upon the orders which railway storekeepers can put in his direction; tenders from the various government building departments await him, and the country swarms with contractors, most of whom can be of use to him. And, luckily, freight rates are low, so that if as a special inducement, he finds it expedient to quote a figure which includes free delivery at a distant point, there still remains a fair margin of profit. It may be added that in securing a contract there sometimes is a good deal of hanky-panky about the tenders—and that the tenderer is not the only person who benefits.

Wages vary a good deal, according to the "district" in which the business is carried on. In Calcutta, a comparatively expensive place, a native will expect at least 15 rupees ($5) a month, but in the north and south two-thirds of this sum will satisfy him. The boys who are employed to oil the machinery and to sweep up the sawdust receive the equivalent of $1.50 a month, and the "durwan" (door-keeper), whose business is to keep a check upon all pilfering, but who invariably dies rich, is paid 9 rupees ($3) a month. Evidently the post in question is worth paying for, since the successful candidate is always ready to handsomely reward any person who is instrumental in obtaining it for him. The native clerks get from 20 to 50 rupees a month, according to their qualifications, and managers think themselves lucky if pay day brings them 150 rupees—$50. The English managers of the large and important sawmills receive up to $30 a week, while a house and one or two servants usually are thrown in. Although no sawmill employee is well paid, Providence tempers the wind to the shown lamb, by arranging matters so that living is cheap. The native mechanic is passing rich with his 10 rupees a month, and the colored manager can live like a fighting cock on thirty. The European manager himself can do pretty well on a small sum, and as to the 1,000-rupee man—he is a miniature millionaire.—The Wood-Worker.

How Should Knives in Round Cylinders be Ground?

There are, of course, at least two answers to that question. Some remove the knives every time grinding is necessary, while the majority of us prefer to grind right in the head. The latter way is unquestionably the better, for more reasons than one.

In the first place, a great deal of time is lost in removing the knives every time you want to sharpen them. And, although you may have an extra set on hand that you can insert, you have to go through the performance of setting each knife, and we all know that accuracy is very essential in order to get each knife to make its share of the cut.

Furthermore, in placing the thin knives on the automatic grinder, they are clamped and undergo a strain that is relieved when taken off the grinder bar. Now, then, by placing them in the cutterhead they are again clamped, but by a different method, and the strain put upon them forces them to take a different shape than when on the automatic grinder bar. The effect of this is obvious. Your knife is forced to take a different position, and if you run the jointer over it while the head is revolving you will find that some parts of the knife have been touched, while others have not. Then what is the conclusion? Your knives are ground crookedly. There is only one remedy, and that is, grind your knives when in the clamped position in the cutterhead. You will find that less of the knife is ground away by this method. Your knives will last longer. And last, but not least, you will have each knife making its share of the cut, and the finish of your stock is better.—Berlin Quality.

This 1911 Model of the

Linderman Automatic Dovetail Glue Jointer

Makes a Tapering Wedge Dovetail Glue Joint

A Glue Joint that proved by the technical test made at the Purdue University to be stronger than the flat or "V" joint or the natural wood. Its use then gives the positive assurance of the best results obtainable.

TO make a Glue Joint as strong as the natural wood it is necessary for the wood fibre by **close contact** and by **adhesive** to be knit together substantially as well as nature binds its wood cells. Warm lumber—warm glue—and a warm room gives the adhesive an opportunity to enter the pores of the wood—but absolutely perfect and effective pressure the entire length of the joint must be exerted to insure fibre contact—and the escaping of the glue to the surface of the lumber does not necessarily force the glue to enter the pores of the wood.

The basic reasons for the extra strength of the Linderman Wedge Dovetail Joint can be stated briefly as follows :—

1st. Due to the shape of the joint—50 per cent. to 100 per cent. more glue and fibre surface.

2nd. The close fit of the sides of the dovetail form a pocket for the glue, preventing its escape, while the tongue and groove are gradually progressing to a fit—forcing, not merely permitting, the glue to enter the fibre.

3rd. The rub joint effect—as the tongue and groove wedge "home," that combs the fibre in the same direction, permitting a matted fibre union.

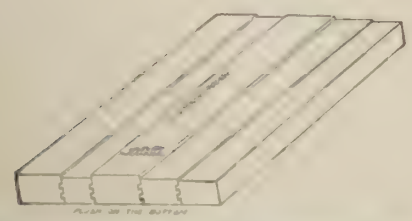
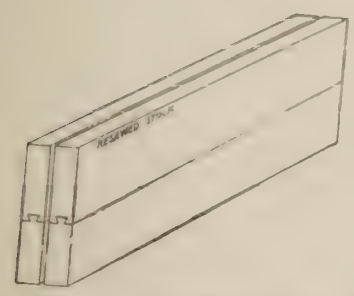
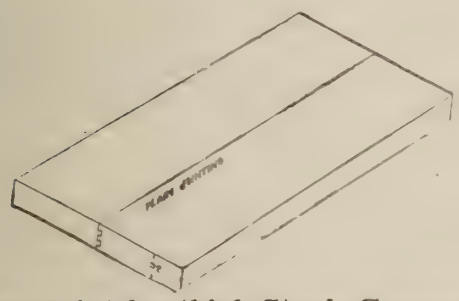
Any Uneveness in Length Appears at One End



Any Uneveness in Thickness Appears on the Top



Two or More Dovetails Can Be Cut For Re-sawing



Plain Joint for thick Stock, Cores, etc.

What the Linderman Automatic Dovetail Glue Jointer Will Do For You

For the lumber manufacturers one of the most discouraging propositions is the disposing of narrow widths and short length stock so as to make a profit on it. Many manufacturers have found that by the use of the Linderman Automatic Dovetail Glue Jointer they are enabled to build up this narrow width into wide lumber and use it for their own products such as the manufacture of boxes, shelving, partition boards, and so forth, and quite a few of them who have no manufacturing plant sell them at a price varying from $2 to $8 per thousand more than what they had been heretofore able to obtain for the narrow widths.

For the box manufacturer there is no more profitable proposition than that of installing a Linderman machine and buying all narrow width, short length lumber and mill culls and converting them into one-piece ends, sides, tops and bottoms, at an average cost of from 50 to 75 cents per thousand board feet. This will enable the box manufacturer to buy his lumber from $2 to $5 a thousand cheaper and to put it into a package that is much superior to the ordinary box. In the 1911 Model of the Linderman Dovetailer, due to the tapering wedge attachment, it is possible for the box manufacturer to produce thinner stock which will make a lighter box, enabling him to compete with the substitute package.

We will be very glad indeed to send samples of the Linderman Joint and give further details to anyone who desires them.

The Retail Dealer and His Problems

Good Advice Regarding Stocks—Importance of Correct Tallies

A Frank Talk With the Dealers

One of the strongest attractions—if not the strongest of all—for a retail yard is the general knowledge that if anything is needed in the line of extra odds and ends of material it can be found in that particular yard. This is true, also, not only in the lumber business, but others as well. When once a store in the town gets the reputation of generally having what a customer calls for, people will get the habit of going there and doing most, if not all, of their trading. Just so is it with a lumber yard. Now, in saying this I didn't mean to infer so much that it is the size of the stock that draws, as it is the variety of the articles it keeps on hand. Of course, it is an advantage to have a large stock with its long lengths and unusual sizes of joists and timber. But a yard trade is not wholly in the handling of this class of stock. It is only at some special season that the trade calls for these, while every day in the year you are selling a good many of other items in small lots, and it is this smaller class of business that counts up fast in the profits of the yard, and no retailer can afford to ignore and neglect paying the attention it warrants.

Some men don't fancy this class of trade, they prefer to go after bigger game. They would rather land a bill of $500 and make only five per cent. paper profits on it, than to sell a hundred dollars' worth in small dribs and make a real profit of twenty-five per cent., for a bill sold on such a margin is a sale at an actual loss, while the smaller trade is clear velvet and the greater part of it also is for the cash at the time of sale. The smaller trade requires, however, a specially close attention to its manifold details. There may not be the fun and the excitement about it as in the larger bill trade, but as I have said, it is the paying end of the business. And, as a whole, where a yard has a good small trade it generally gets its share of the bills, too, and more of them are apt to be non-competitive than otherwise, for if a customer likes your treatment of him in his smaller trading he will be inclined to give you the preference in figuring, and like as not tell you to do the best you can and he won't go anywhere else. A consummation devoutly to be desired by every lumber dealer.

Learn the Requirements of Your Trade

This is another way of saying, attend closely to the little things and the larger ones will take care of themselves. You all know what it is to have a man come to the yard and ask for something that you have not and do not keep in stock, and the consequent feeling you have in seeing him go away, and thus losing a sale. Every young dealer has more or less of this experience, according as is his knowledge of what his trade needs, and often this is one of his chief worries, especially if he is only a new arrival in the town and has not had the time to become acquainted with the particular wants of that community. It takes several years of experience in the trade to find out just what is required for even the ordinary country town, and the young dealer has to dig this up for himself. It is a good plan when first coming in a town to note down everything that is asked for that you don't have in stock. It is a good idea, too, to form this habit whether you are a young or an old dealer. And if an article is asked for several times it is a good sign that it is in demand and there might be a chance to work up a trade in it.

I got on to this trick early in my own yard experience, and whenever I first went into a new place I discovered a good deal of variation in the requirements of different communities. What I usually handled of stock in one locality was not being used in another. And if it was all the same to me I always endeavored to conform to what had been customary. As the country grew, however, I tried to keep pace with the development of its wants and to anticipate what I judged would be needed to correspond with certain things. I didn't always wait till such things were asked for, but got them in and they created the demand for them.

Keep an Assortment of Hardware

It is within the lumberman's province to look ahead and form his ideas as to what people will be likely to want, because of certain changes that may have come. It is these changes that has caused such a variation in the character of our mixed stocks. The late years of the farmer's prosperity has caused many a dealer to handle stock he had never seen until he made the first shipment of it. I presume that a few years ago there were few dealers in the country towns who had ever seen oak or maple flooring, except in a floor, until they have gotten some in on a special order to fill the requirements of a bill.

I well remember the time when I began to have inquiries for prices of hardwood lumber. And after I had turned away several customers I made up my mind that there was going to be a good deal of repairing to be done and I might as well have that trade as the hardware men who kept hardwood in wagon stock only. So I made out a list, after careful inquiry as to the probable kinds and sizes that would be needed and found a place where I could get it, and from that time on, and ever since, I have always kept more or less of a stock of hardwood. I know there are many dealers who don't think it worth while to bother with, because of the irregular demand for it, and then again there are so many sizes and lengths called for, but notwithstanding all this whenever one wants a piece of hardwood he wants it bad and nothing else will do in its place.

It is one of these little things, too, that I have before mentioned that goes to make up the attractive power of a yard, and no matter if one wanting something of the kind is no friend of yours, if he knows you have got what he urgently needs and can't get it anywhere else in the town he is going to come and get it. It don't take much money to carry a small selected stock of hardwood and there is a good profit in it if you know how to sell it. I got on to the trick of selling it by noticing how the hardware men sold the stock they carried. It would be foolish to quote it by the thousand feet. Sell it by the piece. A certain price for the best and straightest pieces, and another for those that are defective or crooked. In this way no trouble is had in disposing of the poorer pieces.

If wood culverts are being used in the locality, it requires not much urging to get the supervisors to use oak plank. It costs but little more in price and its greater wear and durability will speak for themselves. You can in this way get your clear oak in the same car, and besides at a lower price. You save the local freight from the near-by wholesale point when you are ordering it in small lots. And another thing you can sell all the local wagon maker needs at a lower price than he can ship it in locally.

If you have not got a power saw in your yard, nor in the town, get a lot of your common stuff ripped into 1 x 1, 1 x 2, 1 x 3, 2 x 2 and 2 x 3 sizes. They will do it for you at the mill for a trifle more. You may think you won't sell enough of these sizes to bother with, but you will be surprised to see how well they sell, as soon as people know that you have them. It is the idea of getting what they think they want that catches them.

Make the Most of Stock

I was struck by a remark made to me the other day by one of the most expert lumbermen in the city. Said he: "Any lumber dealer now who sells lumber as he gets it don't know his business." This was putting it rather strong, I thought, but as it was in the line of my own opinion I had no argument with him on that score. I have never seen the time since I had been running a yard for three or four years that I didn't skim more or less cream off a shipment of stock before it went into pile. The farmers and the carpenters taught me that trick. When I stood by and saw them sorting over and picking out the best, and bearing down the safety valve of my temper, it gradually came to my mind that I was the one to do all this sorting over beforehand. And when I arrived at this decision and began sorting out myself and charging the price for cream, I noticed an increase in my percentage of profit for the year, and I stopped using the fool argument that I sold lumber as I received it.

There are too many dealers who are selling grades instead of lumber, and they wonder why it is and how can it be that this and that party can sell a bill at lower prices than it can be bought and paid for.

I was in a country meat market last winter, and being from the city, I was curious to know the prices of the different cuts of meat, and I found out that they were about one-half what we have to pay in the city. But, of course, there was a difference through an absence of distinction. A steak was a steak, whether it came from the steak portions of the critter or from off the neck. Sirloin and porterhouse were the same price, and double the amount was sold as such as there is in the carcass. People wanted all steak, and as long as it was cut like a steak they were satisfied and paid accordingly.

A farmer takes a bunch of fat cattle to market and they are sold for what they will grade, and he takes it as a matter of course, for he expects it. But when he goes into his home meat shop he is as liable to get his porterhouse up in the rump as he is to get the real thing. He pays his 15 cents a pound and thinks the butcher is making more money out of selling than he is, but the fact is, if the butcher

sold his meat strictly on grade and just as he bought it he would have to charge Mr. Farmer a good deal more for a real porterhouse steak.

A lumber dealer is a good deal like the town butcher in this respect. If he sells his lumber out in small quantities according to the same grading as he buys it he will be in a similar case with the butcher who would sell a carcass out and give his customers the real cuts they called for. After you read this, just step in the meat market next time you are passing and see if the butcher won't verify what I say. If he tells you the facts you will know that I have given you the straight of it. He may though not be inclined to give the secrets of his business away. Just as you would feel, perhaps, if he came to your yard and quizzed you about the unknown in your business.

Now I will return and talk about the relation between "cream skimming" and the "driblet" trade in your every day business. First of all I want to disabuse your mind of any notion you may have formed that I don't advise giving a man what he pays for. This is just the very thing that I am aiming at. Give a customer what he pays for and no more. The fact is, though, in the retail lumber business, people generally want more than this, and hence their propensity to demand the privilege of sorting over your piles. When customers come for a few pieces of anything in lumber, no matter what it is, naturally they want it for some particular purpose which is usually of a nature that will admit of no defects. They want good common stuff, but without any knots. Now, instead of going to the common piles, take them to a rack in the shed where you have all these selections, which, if they were mixed up in the pile from whence you took them you would quote a price at so much per thousand. But now you must specialize them at so much a piece.

Never mind what they say about how you bought it. You don't tell a carpenter that he should not pick out a six-inch board from common and use it for a door or window jamb where his specifications call for "B" select. Neither do you feel like telling the farmer to lay aside the top of his hay stack when he is hauling hay to sell in the town. In other words, no man likes to have another tell him how to run his business. Probably you may think this will apply to me. What I say, however, is of a suggested character, and you may do as you like about acting on it.

Selling Wide Boards

In my later experience I occasionally bought a car of all widths, No. 2 and No. 3 boards, so that I could get some wide stock out of them. These I would lay away and charge for each board what it was worth when I sold it. If a man wanted one that was better than the others, he would pay me a C Select price for it, and why not? Wide boards are mighty scarce now, and when nothing but a wide board will do for the purpose needed its value is increased thereby. When I was watching the operations in the cypress sawmill plant at Caryville this last April I noticed that the wide boards were handled by themselves. They were beautiful looking stock and if you want any of them you will have to handle more money for them than for those of narrower widths. And yet both came out of the same tree.

I am aware of the fact that there is not much picking nowadays, and yet I have had but little trouble in getting all my select common out of the No. 1 grade. This grade of select was practically unknown when I was running a country yard, but as it is quoted in the lists of the northern pine mills, I presume some of the yards that are handling northern stock keep it right along. Here in the city it is the best of all the money making items in the yard.

Select Common Very Useful

I was in a yard the other day whose principal stock is southern pine. And no other dimension is handled at all, but I noticed they had their piles of select common, as usual. A good deal of this grade is used in the construction of porches and in other places where the framing is exposed and painted. There are many things that a farmer needs such stock for, such as hay racks, stock tanks, hog troughs, windmill towers, rigging for hay forks in the barn, and a lot of other uses, that he wants to pick over the pile for if you are weak willed enough to permit him.

No doubt some dealers are deterred from doing this sort of thing for fear of incurring the opposition of the carpenters. I know pretty well what this is, and what it means to a country dealer who thinks he has to do as the carpenters want him. I remember when I felt that way—I would be on the lookout for them when I was at work piling and laying aside the choice pieces, and if one happened along when I was thus engaged would hastily flip over a few boards to cover the evidence of my regrading. I laugh to myself when I think over it now. What many dealers lack is what we call "nerve" to face the opposition of old time customs and ideas concerning the sale of lumber at retail, and for want of the exercise of it a good many bills could be sold for more money than is gotten for them. How many times have you felt like kicking yourself because your nerve failed you in obtaining a price which you discovered afterwards you might just as well have had.

Yes, the dealers need a little more stiffening in many places where the customers run the yards.

C. H. Ketridge, in the Mississippi Valley Lumberman.

Changes in the Character of Retail Stocks

I had occasion to speak once of the tendency toward the elimination of the individual small dealer by reason of the growing disposition of people to go where there is larger and more diversified stocks and the volume of business is depended on to make up for the narrower margin of profits, says a writer in the St. Louis Lumberman. This is creating an adverse condition for the small-town lumberman, but, in the majority of such cases, there is always a corresponding remedy. Not always, however, is there a disposition to adopt the remedy by the party so affected. People don't like to change their old customary way of doing things, but they either have to do it sometimes or get out of the business game.

When we compare the wants of the average individual of to-day with what he got in addition to his satisfaction not more than a quarter of a century ago, we can but notice that there has been none the less rapid, because we have not perceptibly felt the movement. These changes in the wants of the community have been developed in practically all of the principal lines of trade. In fact, many new lines of trade have been created by them. Look at the average grocery or dry goods store, and the stock that are now carried in a hardware store. Go into a good meat market even, and note the variety of eatables in the meat line kept to tempt the eye and the appetite. Even a good peanut stand is also affected by this development in the wants and tastes of the people. A visit to a well-stocked agricultural machinery establishment will disclose before your eyes a multifarious array of vehicles for travel and cultivating the ground and harvesting its crops. And as you view them, let your memory go back to what such places used to contain for sale so late as even twenty years ago. In fact, the evolution in character of all classes of merchandise is scarcely less marked in one than the other.

Has the Lumberman Kept Pace with Changes in Other Lines?

Now, the question arises how the retail lumbermen in general kept pace with these changes in other lines of business? There is no doubt but in many cases they have, although, as a rule, the dealers carry pretty much the same character of stocks as they always have. They are conservative about adding to their stock what they know little about, and are inclined to keep within their own specialty of lumber and the few side lines which have become customary to a lumber yard. Speaking from my own experience and observation, I should say that while the character of lumber stocks has changed materially, yet, on the whole, I believe the retail lumbermen have lost the control of a good many items which once formed a part of their stock, but which now has gone from them and have become merged into other lines of trade. And, what is more, the number of different thinks in lumber he now carries is gradually narrowing down and becoming less and less every year. He may carry four different kinds of lap siding, made of as many different woods, but it is only siding, and it won't be many years before this, too, will be supplanted on the walls of a house by cement plastering.

The item of fencing, as we used to know it, has practically vanished from the average lumber yard, and unless he handles its substitute—barbed wire—this item of trade has passed into other hands. The general use now of drop siding for barns has rendered almost obsolete the O. G. batten for covering the cracks between the stock or barn boards that were commonly used for barns and outbuildings. The changes in the style of building have cut the dealer out of several other articles of good profit. Among them I may mention that of moulding. 'Tis true, however, there is considerable moulding used yet in the building of dwelling houses, but nothing like what there used to be in the earlier days of the trade. The introduction of worked casing and blocks for the interior finish has done away with the more costly and elaborate grouping together of different mouldings. Where once a door or window was trimmed with a combination of from two to five numbers, there are now but two, the casing and the sash stop. The old heavy base mold that was thought necessary for the best finish is now represented by a mold worked on the base itself. Even the quarter round is not used in this connection as much as formerly. It was the prevailing idea once that in order to have a piece of woodwork look nice there must be a molding stuck on it, and the more that was put on the better it looked to the eyes of most people. It is not so long since that Portiere work was common in the better class of houses, but that has largely been termed as "out of style." About the only things that have taken the place of the articles I have mentioned are the two items of plate-rail and the mold to hang pictures from. Nearly everything is much plainer in interior finish. Even the plasterer is cut out of the work

of fashioning the heavy angle mould and the circular ceiling pieces that used to be the pride of our mothers and grandmothers, and the roosting places for flies on a cool morning.

The Old Fashioned House

Now let us look on the outside and we can see even more the absence of many things that at one time were common in the exterior decoration of a house. Like those of the interior, they yielded a large per cent. of profit to the lumber dealer. Let me call your attention, first, to the openings of a medium class dwelling that was built forty or more years ago. There are a few of them left in every town in the older States, and to the modern lumberman they are a curiosity. I have one in mind that I was looking at a year or two ago. The whole outside of the old house formed a striking contrast to those on either side of it, which are of more recent date. The openings are of the circular top style, and heavily molded on the casing. The cornice is square, with a heavy projection supported by clusters of heavy brackets placed at frequent intervals. What we know as the bed mold is formed of dentil blocks with a heavy mold running along at the bottom of them. The frieze is paneled, with a mold running along at the bottom of it, also. The corner boards are wide and paneled, and a heavy molded cap on it where it comes under the frieze. The baseboard is about the only member of this outside finish that has not been changed by the later architects, and this chiefly because water still persists in following the line of the least resistence. This being of the square style of dwelling, there is of course, a roof deck which is inclosed by a sawed balustrade with small square and molded posts at the corners. There is a porch to this house, and it is, of course, of the same general style. The columns were made in the carpenter shop with material gotten, no doubt, from the local lumber yard. The whole porch is built up in that way, and where such buildings were put up in the country towns where there was no planing mill the whole of the "gingerbread" work and material on this porch would have been made and furnished by the home mechanic and lumber yard. When you come to what is known as the Gothic style of houses, there was a good deal more of this class of ornamentation. The verge boards for the gables, the finials and comb finish of the roof and other things that go with this style, were all made by the local carpenter or furnished ready made by the factory, and came through the medium of the lumberman who, of course, made his profit out of it.

Rural Districts an Exception

But all of this is now changed for him. The elimination of those things which I have briefly mentioned in the foregoing has cut deeply into the profits of the lumber business. In the larger towns and cities it has got so now that about all he is called on to furnish is the material for the bare structure. The mills and the factories furnish all the rest, which include the doors, windows, interior finish and hardwood floors and most of the porch work also. If this material is furnished through the yard the dealer gets mighty little for his risk and trouble. Of course, it is not so bad as this in the country neighborhoods. There still lingers in the minds of some of the rural residents a love and a hankering for the showy and ornate in architecture. A farmer's wife will still have her pantry, closets and shelving in her long-planned new house. The cheffonier would be in her way in the rooms; she wants a place where she can tuck away the old truck that is too poor to use and too good to give away or destroy. And in this she is, perhaps, among the best friends of the lumber yard. She likes paint and graining better than the varnish finish. A floor without being carpeted would not be comfortable and homelike to her. Put a hardwood floor in a farm house, and the average farmer would cuss it in less than a week. He wouldn't dare to go on it with his heavy, dirty boots. He would be raked fore and aft by the tongue of his wife and reminded that such a floor was not for common use. Many a man is made miserable by the building of a new house and the consequent change in his old free and easy habits. And so the farm house is still being built with a view to the utility and comfort of its occupants. There is many a city man who is living in his modern palatial residence, with all its luxurious belongings, who at times lies back and thinks of the old roomy farm kitchen of his mother's, and unconsciously longs for the homely comforts and the freedom he once experienced there. Yes, indeed, the country towns are still the place for the retail lumberman, for however much his stock may have changed from what it used to be, there are yet enough items in it to make him realize that he's still a retailer of building material.

I might mention before I close another change that has come in the retail stock of even a country yard. Do you remember the pickets and blinds that we used to handle in the seventies and eighties? Why, a lumber stock then was not considered complete without them. When a bill for a house was figured on it included, as a matter of course, the blinds for the windows. You didn't have to ask the size of them, for it followed that so many windows would require just so many pairs of blinds, and if the party was from one of the New England States you could safely bet on the color it would be painted. A white house with green blinds was as typical of the "Yankee" as was his propensity to "swap" and "dicker." Now, the last lingering vestige of the architectural taste of the Easterner seems to be found only among some old-fashioned Germans who still persist in wanting some kind of a shutter to their windows. The old German is about the only one, too, who has any use for a picket fence. It is curious how quickly the picket fence has vanished from the residence lots in the towns. It doesn't seem but a few years ago that every residence of any pretensions at all was inclosed by a more or less elaborate picket fence; but the lawn mower came, and with it went everything of an enclosure about the average town residence. These two items of pickets and blinds have gone almost entirely from the trade of the lumberman, and if you will observe closely you may note that hardly a year goes by now without here and there something being crowded out of the trade of the dealer. The natural question comes up, "Where is it going to stop?"

The Value of Correct Tallies

That a reputation for shipping good grades of stock is a desirable thing for a mill to have, a valuable asset that is of material assistance to the salesman in getting orders, we all know; and we have a hazy idea that it is a good thing to have a careful tally of the stock so that there may be no back claims on the invoice. But if every mill man realized the full value of correct tallies there would be more attention given to the careful loading of stock, says the St. Louis Lumberman. The small mill operator, and sometimes the big one, too, figures that the man receiving the stock will tally it carefully anyway.

Suppose there is a transfer, or something happens to the lumber in transit? Unless there is a careful and dependable tally, one that one can swear by, it is pretty hard to establish a claim for loss. And there is another thing, the thing in mind that is responsible for this subject: there are times when the yard man buying stock likes to dispense with his own tally, and to feel safe in the tally and invoice from the mill.

During the present season a yard man who handles about 600 cars of lumber a year was showing the writer his books and the system of keeping up with the orders and cars received. Incidentally the question of his own tally and its comparison with the mill tally came up. He smiled at that, and said that he made but little effort to keep a permanent tally of his own; consequently he did not arrange to enter them along with the mill invoice. And finally he admitted that he did but little re-inspecting and tallying. He had men competent to do it, but during the busy season they could not handle all the stock moving in and out, and the men he would pick up to unload cars were often not competent.

When a car of stock is being sent right out on a job he keeps the load tickets and compares them with the invoice tally, but often when a car is going into the stock piles he simply sends men to unload it, without special inspection or tally. One of his men will look into the car a little to see if it seems to be running right, and if it is, that is as far as the examination goes.

This looks like a haphazard way to do business in this day of system and close figures, but he excused it on the plea that it cost extra money to keep close tally on everything, and extra cost eats up the profit of retailing. Also—and here's the point—he tallies up on some mill occasionally to see how the stock is running, and when he finds a mill that is careless in either inspection or tally, he cuts that mill off his buying list and gives his orders to the mills that tally correctly as well as inspect carefully. That is a simple, and may seem like an uncertain system, but he says it works well, and that it is very seldom he finds any **shortage** in his tally.

The Influence of the Forest Ranger

It has happened some times that forest rangers in the employ of the Dominion and various provincial governments, have not seen eye to eye with missionaries whose work takes them into the backwoods of Canada. At times one has heard criticism of the missionaries' methods and at other times missionaries have felt obliged to criticise the methods of the fire rangers most severely. It is therefore a matter of considerable satisfaction to note that the Anglican Missionary at Split Lake on the Nelson River, recently considered it his duty to report to the Superintendent of Forestry at Ottawa upon the excellent work and the high character of the government's representative in that district. Writing under date of April 28th, the missionary in question expresses his views as follows: "It gives me very great pleasure to bear witness to the moral conduct of Mr. H. Branigan, your representative at this post, because it is too often the case that those who come in to enforce laws, deprave natives and then throw mud at missionary effort. The protection of our forests is a national question, but the protection of morals is also an issue of which the Judge takes notice in the Grand Assize."

News of the Trade from Eastern Canada

Messrs. Clarke & Company, lumber dealers, have been registered at Burry, Que.

The stave mill of Joseph N. Bullivant, Mosherville, Hants County, N.S., which was destroyed by fire on May 21st, has been rebuilt and work has been resumed.

During the very dry spell which occurred in July, a fire started in the limits of the S. P. Benjamin Company, Hants, N.S., burning over a large tract of land and destroying a quantity of young timber.

The St. Croix Lumber Company, of Hartville, N.S., have sold their mill on the St. Croix River and their limits on the Panuke lakes to Messrs. Davison and Hill, of Onslow, and R. M. McGregor, of New Glasgow, N.S.

The Knott-Sampson Lumber Company, of Boston, Mass., who are represented in Nova Scotia by Mr. John G. Grey, will ship from Windsor, N.S., to the United States markets this year four million feet of spruce, pine, and hemlock lumber. Most of this will go to Boston and a small quantity to New York and Sound ports.

The South Shore Power and Paper Company, recently organized, with a capital of two million dollars, propose to build a large paper and pulp mill at Drummondville, P. Q. The company have acquired several water power rights on the St. Francis River, within a radius of ten miles of Drummondville, and have under consideration the question of developing 10,000 horse-power.

An excellent demand is general throughout the Annapolis Valley, N.S., for apple barrel staves and headings. All the stave and heading mills are being worked to capacity in order to keep up with business and it is expected that this condition of affairs will continue throughout the balance of the season, as the prospects for a good apple crop are most encouraging.

Business Booming at Fassett, Que.

The Fassett Lumber Co., Limited, of Fassett, Quebec, are experiencing one of the best years in the history of the company. Mr. Collins informed a representative of the Canada Lumberman that up to August 1st they were six and a half million feet ahead of that time last year and that they were getting higher prices this season than ever before. They have recently placed a representative in the Toronto field to look after their growing business here. Three additional miles of track are being built in connection with their railroad which runs direct from mill to limits, making eighteen miles in all. The mill runs all year round, summer and winter, to meet the growing demand for their stock.

Quebec Timber Cullers Report for July

The Supervisor of Cullers for the Province of Quebec has issued the following comparative statement for the month of July, 1910, 1911 and 1912:—

	1910 Cubic Ft.	1911 Cubic Ft.	1912 Cubic Ft.
Waney White Pine	236,240	440,720	227,280
White Pine	9,640	.....	80
Red Pine	4,760	6,240	1,320
Oak	67,040	14,120	10,000
Elm	224,680	158,960	200,520
Ash	720	80	120
Birch and Maple	40,680	58,800	38,640

A Valuable Book for Hardwood Lumbermen

The National Hardwood Lumber Association of Chicago, Ill., have favored the Canada Lumberman with a copy of the report of their last annual convention. The report contains also the rules for inspection of quartered gum, white maple, bridge plank, and other woods, not covered in the regular book of inspection rules. The report will therefore be of much interest to all engaged in the hardwood lumber business. In anticipation of a heavy demand, the Association have ordered a generous supply, and state that they will be pleased to send a copy to anyone, upon request.

The natural disposition of a saw is to run right; when it runs wrong there is usually something unnatural about it or its arrangements.

A good way to repair an emery wheel that is out of balance is to box it up and ship it back where it came from. You will find this less troublesome than any other method.

Get the safeguard habit. It may seem a bit awkward at first, but you will get used to it in time. There is no getting around the call for more safeguards on our wood-working machines.

Mr. Gifford Pinchot, president of the National Conservation Association, and who for several years was chief of the United States Department of Forestry, has been on a visit to Victoria, B.C., where he fulfilled a promise made earlier in the season to give Mr. Overton Price, the new head of the Forestry Department, the benefit of his experience in preparing the plan for the organization of the forest branch for the province. Speaking of the organization of a department for the work of forestry conservation, Mr. Pinchot, in an interview at Victoria, said; "This work is to be organized just as you would organize any other large business. After ascertaining what duties are to be discharged and how the responsibility should be distributed, the next thing is to begin building up your personnel. This is perhaps the most important part of it all. The service in the United States, which began with eleven persons, now has over thirty-five hundred, and spends over five million dollars per year. That means an expenditure of two cents per acre per annum, which, I understand, is the same rate as has been provided for by legislation in this province.

National Hardwood Inspector for Canada

Mr. John J. Miller, formerly deputy inspector for the National Hardwood Lumber Association, stationed at Buffalo, N.Y., has been appointed chief of the inspection department of the association for Canada. This is a new departure for the National Hardwood Association and will be endorsed by the large number of members whom they have in Canada at the present time. Mr. Miller's duties will

be to call on the Canadian members of the Association to inspect and measure lumber purchased or sold by them. He will issue a guaranteed bonded certificate of the Association exactly as the present inspection force is doing in the United States. At present there are eight hundred members who endorse the plans of the Association and the results which are being secured, and who believe that the same methods applied to the requirements of Canadian hardwood interests will bring satisfactory results.

The advent of this well-known and powerful association into the Canadian field will be welcomed by Canadian hardwood lumbermen. The Association stands for fair dealings and a proper grading of lumber, which is something that the Canadian trade requires urgently at the present time. The Canada Lumberman wishes Mr. Miller every success in his new position and earnestly hopes that the Canadian hardwood trade will do all in their power to assist him in his duties.

Wood Pulleys

You have probably noticed that wood is very conspicuous in pulleys these days; that it is used in many places where it was not though of before. It was perhaps the split idea that first made the wood pulley popular, and that idea is good yet, so good that it is freely used in metal as well as wood pulleys. But now one finds many wood pulleys where there is but little call for the split. A sample instance is on motors for driving machines. When dynamos and motors were new things wood pulleys were not a part of them. They are now, though, and they are an important part wherever belting is used. There are places where the metal pulley is essential, and it will always be used, but where it is not absolutely necessary to use metal the wood pulley seems to be getting the call right along.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

WANTED—A quantity of 4/4-in. Ontario Plain Red Oak, vicinity of Georgian Bay preferred. Apply Box 535, Canada Lumberman, Toronto, Ont. 14-17

Slabs and Cord Wood Wanted

Am open to buy any quantity up to 10,000 cords hard and soft wood slabs and cordwood. Write me. Horace Hartley, 19 Mayor Street, Montreal. 15-19

Square Hemlock Wanted

8 x 8 and up x 10 ft. and up, Merchantable Hemlock. Horace Hartley, 19 Mayor Street, Montreal. 15-16

White and Red Pine Wanted

3 in. x 6-in-7-in. 18 ft. Tank Stock.

Ontario Wind Engine & Pump Co., Ltd.
Toronto, Ont. t.f.

Basswood Lumber

We will purchase Basswood Lumber, 1-in. and 1¼-in. thick, white stock by car or entire stock. Write us what you have and what you want for it.

Box 498, Canada Lumberman, Toronto, Ont. 11-15

Trimmer Ends Wanted

Price and freight rate permitting we will contract to take your White Pine Trimmer Ends, rotten pieces thrown out, fresh stock and not colored. Write price per cord on car and state shipping point.

The Wm. Cane & Sons Company, Ltd.,
11-17 Newmarket, Ont.

Birch Wanted

Want 200 M. ft. 10/4 1st and 2nds and No. 1 Common Birch. Give average widths and lengths and percentage of 14 and 16 ft. lengths. Want price delivered Philadelphia, Pa. and New York City.

Want 200 M. ft. 6/4 No. 1 Common Birch delivered Boston, Mass.

Want 5 cars 4½ in. and 5 in. 1sts and 2nds. Birch delivered New York City and Philadelphia, Pa. Reply Box 526 Canada Lumberman, Toronto, Ont. 14 T.F.

FOR SALE—LUMBER, ETC.

FOR SALE—On an .08c. rate to Toronto, 3 cars 1-in. dry Maple, 1sts and 2nds.

WILSON BROS., LIMITED,
15 Collingwood, Ont.

For Sale

100 M. ft. 2-in. Cull Spruce. 300 M. ft. 1-in. Cull Spruce. 15 M. ft. 1¼-in. M. C. White Pine. 50 M. ft. 2-in. M. C. White Pine. Fred T. Smith, 310 Board of Trade Bldg., Montreal, Que. 1.t.f.

For Sale

500,000 feet Band Sawn Birch 4/4, 5/4 and 8/4 in shipping condition, rail or water shipment The Rathbun Company, Deseronto, Ont. 14-17

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co., Ltd., Toronto, Ont. 7-tf

For Sale

To the manufacturers: Birch, Maple, Basswood and Elm in all thicknesses. Send us your enquiry. The Meaford Lumber Company, Meaford, Ont. 7-20

Lumber For Sale

4 cars 1-in. good cedar for boat building.
100,000 ft. 2 x 6 mill run hemlock.
100,000 ft. 2 x 8 mill run hemlock.
4 cars 2-in. white oak, sound and square edge. Apply to Geo. C. Goodfellow.

Montreal, Que.

Shingles For Sale

for immediate shipment. Standard grades.
7 cars Specials.
5 cars Extra No. 1 with clear whites in.
5 cars Clear Whites.
Which we bought before the raise and can sell under the market, write or wire for prices for immediate shipment. 14-15

KEDDY & KENNY.
Hemmingford, Que.

For Sale

For quick shipment, 800,000 ft. Birch. All grades and thicknesses.
200,000 ft. Soft Elm M. R. All thicknesses.
100,000 ft. Basswood M. R. inch.
100,000 ft. Maple. All grades and thicknesses.

Send us enquiries. The Meaford Lumber Company. 7-20

FOR SALE—MACHINERY, ETC.

For Sale

Two Steam Logging Engines by Alex. Dunbar & Sons. John Breakey Registered, Breakeyville, P.Q. 14-15

Saw Mill For Sale

On Georgian Bay, adjacent to North Shore, good two-storey circular mill in good running condition, double edger, trimmers, capacity about 12,000 feet per day; plenty timber available and ready sale for slabs; splendid opportunity for small millman; will be sold cheap as owners have other interests requiring their attention. Box 444, Canada Lumberman, Toronto, Ont. 5-TF

For Sale

In perfect order a McGregor Gourlay Planer and Matcher. Planes up to 15 inches wide by 16 inches thick. For sale at liberal conditions and terms. Apply to Automatic Wood Box & Turning Co., St. Romuald, Que. 15

Machinery For Sale

A Waterous No. 4 Band Saw Mill, with Carriage Saws, Live Rolls, and complete Filing Room equipment, also several Good Woodworking Machines, in splendid condition.

J. S. FINDLAY,
2-TF Owen Sound, Ont.

For Sale

Sawmill, in good condition, on Burford Lake, six miles from Wiarton, equipped with 70 H. P. boiler, 60 H.P. engine, new carriage by Long Bros., Orillia, Ont., good trimmers and endless chain attachment for hauling logs out of water.

Terms, etc., apply Massey-Harris Company, Toronto. 4-T.F.

Machinery For Sale

Steam Boiler, 16 ft. x 60 in., 98-3½ in. tubes, 36 x 36 steam dome, pressure carried 100 lbs., 16 ft. x 10 ft. water back, breeching grate bars, front injector, safety valve, water column, mud drum, stack foundation plate. Also one 10 x 7 Single Dean Pump. Boiler in first-class condition; has been used very little; will sell cheap. The Cleveland-Sarnia Saw Mills Company, Sarnia, Ont. 15

Cowan double surfacer, pipe bender, rope drive, ribsaw, one fifteen horse motor D.C. one twenty-five horse generator D.C. Apply Gold Medal Furniture Manufacturing Company, Toronto. 15-17

Logging Equipment For Sale

100 Russell logging cars, complete with all chains, brakes, etc., in strictly first class condition at exceptionally low price. Full outfit of logging equipment, horses, harness, sleighs, chains, tools, blankets and camp outfit, all at a small fraction of its value. Write for prices and full description to Yawkey-Bissell Lumber Co., Arbor Vitae, Wis. 14-17

Machinery For Sale

One 10-in. moulder on base Hespeler Machinery Co.; one 26-in. divided roll Ballantine Planer; one power feed rip saw Ballantine; one 16-in. buzz planer with Jones guard; one 30-in. bracket band saw; one shaper; one roll top cut-off saw; one wood frame cut-off saw and groover with two patented grooved heads; one wood frame rip saw with boring attachment; one mortiser; one tennoner; one sash and door sticker with five heads; one door clamp; one 16-in. swing lathe; one sand drum; one 30-in. x 30-in. x 36-in. safe; one 35 h.p. engine and boiler; one emery with three wheels; one swing saw; a large quantity of sprocket wheels and chains; one automatic saw gummer; twelve roller bearing factory trucks; one rope feed saw mill; large number of wood split pulleys; quantity of used belting; quantity of shafting hangers, boxings, etc. Will sell any of the above cheap for quick sale.

Write to Box 576, Canada Lumberman, Toronto, Ont. 12-tf

WANTED immediately first class band sawyer, double cut "R. H. Mill." Apply Mickle, Dyment & Son, Gravenhurst, Ont. 15

Reporter

We want an energetic representative in each town in Canada to report on building and engineering work—to tell us where machinery, equipment, supplies or materials may be sold. Reports are paid for on the per item basis. It depends upon your own efforts how much you make. This is a profitable side line and there is good money in it for a hustler. Write to MacLean Daily Reports Limited, 220 King Street West, Toronto.

BUSINESS OPPORTUNITIES

Panel and Veneer Plants for sale at public auction on August 15th, 1912. Fully equipped, excellent condition, accessable to timber and good local market. Ernest Cawcroft, Trustee, Jamestown, New York. 15

For Sale

Planing mill, well equipped with modern machinery, doing good business. Ill health only reason for selling. Reply J. S. Richardson, Tillbury, Ont. 12-15

Timber Limit For Sale

1,200 acres Hardwood, Hemlock and Cedar. Some Pine; 9 million feet for $5,000 cash. Five miles from railroad; two from river. Box 431, Canada Lumberman, Toronto, Ont. 6-t.f.

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

For Sale — Sawmill with Capacity

Of one hundred thousand feet per day. Located in Everett, Wash. Good rail and water shipping facilities. Ten and one-half acres of land with excellent mill pond. Price less than one-third of appraised valuation. 15-18

Address, P. GARDINER, Everett, Wash.

Tenders for Pulpwood Limit

Tenders will be received by the undersigned up to and including the 15th day of August next, for the right to cut pulpwood on a certain area, situated on the Abitibi Lakes and River, tributary to the Grand Trunk Pacific Railway, and the Temiskaming and Northern Ontario Railway, in the District of Temiskaming.

Tenderers shall state the amount they are prepared to pay as a bonus in addition to dues of 40 cents per cord for spruce, and 20 cents per cord for other pulpwoods, or such other rates as may be from time to time be fixed by the Lieutenant-Governor in Council, for the right to operate a pulp mill and a paper mill on or near the area referred to.

Such tenderers shall be required to erect a mill or mills on or near the territory and to manufacture the wood into pulp and paper in the Province of Ontario—the paper mill to be erected when directed by the Minister of Lands, Forests and Mines.

Parties making tender will be required to deposit with their tender a marked cheque payable to the Honorable the Treasurer of the Province of Ontario for ten per cent. of the amount of their tender, to be forfeited in the event of their not entering into agreement to carry out conditions, etc.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

W. H. HEARST,
Minister of Lands, Forests and Mines.
Toronto, Ont., May 15th, 1912. 11-15

For Sale

The best equipped planing mill in Northern Ontario in fast growing town. Also lumber yard in connection. Splendid opportunity for live man with some capital. Owner retiring from business. Apply Box 522, Canada Lumberman, Toronto, Ont.

For Sale

Established Lumber Business, with first class mill, now running full time. Timber limits with 20 to 30 million feet of standing pine timber conveniently located, and all merchandise, etc. Price $55,000. This is worthy of investigation. Address Box 332, Canada Lumberman, Toronto, Ont. 19-22-t.f

Hamilton Lumber Yard For Sale

Established lumber business with more orders than can be attended to with present equipment, in rapidly growing East Hamilton. Owner will sell controlling interest or entire business and can show good reasons for selling. A grand opportunity for right man. Five to Eight Thousand Dollars required. Apply Box 543, Canada Lumberman, Toronto, Ont. 15

Timber For Sale

Tenders will be received up to and including the first day of October, 1912, for the right to cut white and red pine and spruce, on two timber berths on the upper waters of the Jocko River east of the townships of Garrow and Lockhart, in the District of Nipissing, Province of Ontario, the berths being designated "Jocko No. 1" and "Jocko No. 2," each containing twenty-five square miles more or less.

For maps and conditions of sale apply to the undersigned.

W. H. HEARST,
Minister of Lands, Forests and Mines.
Toronto, July 17th, 1912. 15-18

Alberta's New Forest Fire Laws

Railway companies operating in the province of Alberta are liable for fires in forests and elsewhere starting within 300 yards of their rights-of-way, both sides, according to a new act which became effective on the Canadian Pacific railroad, July 5, and on the Canadian Northern and Grand Trunk Pacific lines, July 15. It is provided under the regulations, given out at Edmonton on July 3, that in the event a fire gains control the carrier company must fight it to the extent of ten miles, being responsible for the cost and the damage.

The railroad companies must patrol the first districts, regularly, going over the road from two to four times a day. The patrolmen must be employed and paid by the roads, instead of by the Department of the Interior, and the latter will appoint an inspector to see that the work is carried on properly. If a road is lax in appointing patrolmen, or if patrolmen fail in their duty the matter will be reported to the superintendent. If he fails to act, the department will go to the board of commissioners and lodge a formal complaint.

In a letter sent to the head if each railway by Clyde Leavitt, chief fire inspector for the board of railway commissioners, the principal means of fire prevention and control are classified under six general heads, as follows:

The adoption and use of fire protective appliances on locomotives burning coal.

The extinguishing of fire, live coals, and ashes deposited upon tracks or rights of way outside of yard limits.

Non-use of lignite coal.

The establishment and maintenance of fire guards.

The organization of a special force of railway employees for fire prevention, with particular reference to patrol.

Regulation of burning of inflammable material along rights of way.

The details of the patrols required in districts in British Columbia and northern Alberta along the Grand Trunk and Canadian Northern roads are extensive. Velocipedes will be largely used, and fire rangers will go over their districts thirty minutes after the passing of every train. They will travel by foot or on horseback where it is inconvenient to use velocipedes. It is expected that 100 men will be required for the work.

So far as is practicable, the work of patrol has been combined with the other regular duties of patrolmen, but where this is impossible, or where it is not so stated in the letter, the patrol force is to be a specially organized and specially supervised body of men, who shall perform, to the exclusion of other duties, the patrol and other fire protective work, indicated in the regulations of the board.

The hours of the patrols required in the mountain districts shall be continuous between 7 o'clock in the morning and 6 o'clock in the evening of each day, including Sunday, with a minimum patrol of two round trips each day, one in the forenoon and one in the afternoon.

Where velocipedes are used, all patrolmen passing through telegraph stations will be reported the same as passing trains, and such records will be accessible to the inspectors in the employ of the forestry branch.

D. Roy Cameron, of Kamloops, B.C., district inspector of the Dominion forest reserves, has been appointed chief fire inspector on the Canadian Pacific mountain division on the main line, and three other employees of the Dominion forestry branch are to be appointed divisional fire inspectors, with headquarters at convenient points, each to act as inspector under the direction of the chief inspector. W. N. Miller, stationed at Calgary, district inspector of forest reserves, is appointed chief inspector of district No. 3 of the Alberta division.

That the department is using every endeavor to minimize forest fires is evidenced by an extract from the letter, which is as follows:

"In order to minimize the danger of fires from smokers on railway trains, notices should be posted in all passenger cars, and on the rear platforms of observation cars during the period from April 1 to November 1 of each year, requesting passengers not to throw lighted cigars or cigarettes from the train. Porters and other employees on passenger trains should be instructed to request the observance of this precaution by passengers as far as possible. Suitable receptacles for cigar and cigarette stubs should be kept on the rear platform of all observation cars, while such cars are in use."

The work of removing all inflammable material from the right-of-way is to be taken up vigorously as required by the railway act. The letter compliments the roads upon having given assistance in this work in forest fire prevention, but reminds them of the fact that there is still much to be done.

Lumber Statistics of Two States

A census report on New York manufactures says of the manufacture in that State of lumber and timber products:

This industry in the State in 1909 was represented by 674 independent planing mills, 1,389 sawmills and loging plants, and 200 packing-box factories, which reported 65.9 per cent., 20.7 per cent. and 13.4 per cent., respectively, of the total value of products for the industry. The corresponding percentages for 1899 were 56.4, 28.7 and 14.9, respectively. The value of the output of the sawmills and logging plants of the state was $15,131,000 in 1899, $13,310,000 in 1904, and $15,036,000 in 1909. The industry as a whole shows an increase in value of products from $52,738,000 in 1899 to $61,677,000 in 1904 and to $72,530,000 in 1909, an increase for the decade of $19,972,000, or 37.5 per cent, and for the more recent five-year period of $10,853,000, or 17.6 per cent. It is apparent, therefore, that the growth of the entire industry was due very largely to the increase in the production of the planing mills. Measured by value of products, New York ranked second in 1909 among the states of the Union in the lumber industry.

The number of establishments in New York was 2,263; persons employed, 32,458; horsepower used, 131,462; capital invested, $64,490,672; expenses, $65,012,000, value added to products by manufacture, $30,824,000.

In Massachusetts in 1909 708 establishments were engaged in making lumber and timber products valued at $23,025,000, of which $10,541,000 represented the value added by manufacture. The industry engaged 10,500 people and used 44,784 primary horsepower, had $17,551,000 capital invested and paid expenses of $20,208,000 annually.

Ravages of Spruce Bud Moth

Alarming reports of the ravages by the spruce bud moth in the north woods of Somerset County, Maine, have been received recently. The older of Somerset County lumbermen recall plagues of the bud moth by tradition about a century ago, and again in the late seventies. In the second instance, the pest practically ran out in five or six years. The present outbreak was first noticed about three years ago.

Measure Your Lumber With the Barkey Lumber Register

The most accurate measure on the market.
Can be instantly adjusted.
Capacity 60,000 feet.
Measures any width and length.
Can be used on any moulding or matching machine.
Will work backward as well as forward, and will not slip on smooth or icy boards.

SENT ON 30 DAYS' TRIAL. RETURN AT OUR EXPENSE IF NOT SATISFACTORY.

Review of Current Trade Conditions

Ontario

A scarcity of dry stocks, and in fact stocks of any kind, coupled with a shortage of freight cars, are the principal drawbacks that the lumber companies in the Ontario trade have been facing for the past two weeks. The labor market is also a factor. Mill men, wholesalers and others throughout the province state that they cannot get men to load stock or cars to ship. Although the immigration this year has been greater than ever before, it does not seem to have affected the lumber mills to any considerable extent. Men are in demand for all classes of work, principally for railroad construction and lumbering operations. A great many men will be needed at the camps this winter, and it is expected that the labor shortage will then be felt more than ever.

Trade conditions throughout the province are on a firm footing, prices on the whole are good and the demand is abnormal for this time of the year. Dry stocks are scarce, in fact they cannot be had at any price. Hemlock prices are stiff with little stock on the market. Pine on the whole is a little easier with a good demand, owing to the large amount of building operations in progress. The car shortage is said to be responsible to a large extent for the delay in shipment from several mills. The railroad companies claim that they are doing all in their power to move freight, but the mill men and wholesalers state that they cannot get cars under any consideration, and several of them are of the opinion that this fall will see a further shortage, on account of the immense grain crop that has to be moved in the West. The railroad companies, however, state that they have plenty of cars on hand to move the grain crop and to take care of the lumber trade, which is expected to be heavy this fall.

The hardwood trade is in good shape with a scarcity in some lines. Birch and maple, particularly dry stocks, cannot be had and furniture manufacturers are doubtful whether they will be able to get a supply of seasoned stock for winter use.

American manufacturers are buying up this wood to a considerable extent, chiefly the better grades, and in consequence a large amount of inferior stock is left on the Canadian market and cannot be used by the manufacturers. The hardwood dealers expect, however, to take care of all orders within the next couple of months. Prices are stiff, but it is said that no further advance is anticipated for the present year.

Lath and shingles are in good demand and prices remain steady. The arrivals from the coast have not been numerous, but this has had no effect on the prices. Lath, owing to the large number of building operations, is in good demand with no shortage reported.

Eastern Canada

Trade conditions throughout Eastern Canada and the Eastern States are excellent. Lumber of all kinds is in demand and prices are very firm. There is a large amount of building going on and in consequence hemlock and pine are in considerable demand for immediate use. Dealers are buying stock in limited quantities only, but it is expected that they will make a heavy demand on the market after the harvesting season. Dry stocks are scarce and prices are, if anything, on the increase. Builders as a rule are taking inferior stock for their buildings, owing to the scarcity of No. 1. The car shortage has also been felt to a considerable extent throughout this territory. The railroad companies are preparing to move the western grain crop and are rushing all the available cars to the West and lumber manufacturers in the East feel that they are going to be hampered with the car shortage this fall. Spruce, on the whole, is not as active as it has been, but as the export trade promises to increase in the near future a better demand is looked for. The effect of the strike of the dock workers in England has not been felt to any extent in eastern ports.

The chief reason given for the small export trade is the abnormal freight rates. Hardwood is in demand, but it is none too plentiful, birch being very scarce. This wood is in constant demand among furniture dealers and implement manufacturers, and dry stocks cannot be had at any price. Mill men state that they cannot cut birch fast enough and that it will be utterly impossible to get dry stocks this year. The lath and shingle market throughout the East is in good shape with a good demand, and fair prices. The Boston trade shows a falling off to some extent, although conditions are expected to become normal in a short time.

The high freight rates from ocean ports at the present time are causing anxiety for several eastern dealers. The dealers claim that they cannot see why the rates are so high, as there are a large number of vessels in Atlantic coast ports lying idle. They feel that the rates are being boosted by the steamship mergers and many of them are of the opinion that lumber shippers of the East should get together and purchase a line of steamers to carry their own stocks to the old country.

Great Britain

The English lumber trade conditions have been affected a good deal of late by the dock strike in London and also by the ever-increasing freight rates. The unloading of vessels has been greatly hampered in the port of London by the strike, and stocks when they are unloaded are simply piled on the wharf and cannot be moved. English shippers, on the whole, cannot explain the rise in freight rates. The market as a rule is good throughout the United Kingdom, but dealers are, if anything rather wary about importing, owing to the prohibitive rates. Ocean freight rates at the present time are about $4.00 more per standard than they were a year ago and it is expected that a further increase will be made in a short time. Stocks at large centres in the United Kingdom are about 4,00 standards less at the present time than they were during the same season last year. Pine is in good demand and stocks are getting low. Dealers have large blocks of stock on order, but state that the shipping facilities from St. John, Miramichi, Halifax and other parts are entirely inadequate and that they cannot get their orders in time. Prices are firm with, if anything, a tendency to advance.

In Manchester, the trade continues brisk with good prices. Dealers in this city claim that they are making little or no profit on lumber as it is all eaten up by the high freight rates. There are a number of good inquiries for pitch pine, of which there is a scarcity in the English market. Dealers as a rule are not holding large stocks to any extent. The imports as fast as they come in are being used, which is giving the dealers no opportunity to stock. An interesting table which was published recently shows that pitch pine logs have advanced in price almost fifty per cent. in the past ten years and pitch pine planks almost thirty per cent. Dealers state that this advance has been entirely due to the increase in ocean freight rates. Hardwoods are as a rule in good demand and prices are firm. The cabinet-makers' strike affected the market to a considerable extent, but as the strike has been settled it is expected that the market will show increased activity in the near future. At Glasgow, conditions are good, and there is a healthy demand at the present time. Stocks are restricted as a rule to certain lines and shippers are as a whole advancing prices. Spruce is very firm with good prices and a fair demand. The increase in freight rates is also bothering dealers at this port, and they state that if the increase continues, lumber prices will be entirely out of proportion to the trade.

United States

Taken as a whole, the lumber trade throughout the United States seems to be in fairly good shape, the mills are fairly well caught up with their orders, and are now cutting yard stock. A steady demand is looked forward to for the rest of the summer, owing to the activity in the building line in all of the large cities. Stocks as a rule are none too plentiful in any line, and dry stuff is in considerable demand. The railroads are doing fairly well in moving stocks, although most of them are busy moving cars west to handle what promises to be one of the greatest crops ever harvested. There is very little change in the yellow pine market, the demand is not good to any great extent, but the movement shows a fair amount of activity. Some of the larger buyers are in the market for fall requirements and the latter half of the month will probably show improvement. Mill stocks as a rule are light and assortments very poor. Cyprus is selling well and manufacturers are booking large orders. Mill stocks are somewhat broken in this grade of lumber, while dry stock cannot be had.

Hemlock is in good demand. Prices are very firm and the volume of business is steady. Dry stocks cannot be had at any price, and, as a rule the consumers are quite willing to accept shipment no matter how wet the stocks may be or how unseasoned. The advance of 50 cents per M. which went into effect at Buffalo on the first day of July does not seem to have had any effect upon the volume of business done. Building is active and contractors are using hemlock freely in preference to other wood. Eastern boards at Boston are firm, although some of the manufacturers are holding stock at prices a little above the market and feel that they will get their price. Clipped boards as a rule command $22, although it is said that some sales have been made at $22.50.

In Northern pine, business is fairly active, the lower grades being in demand. Box lumber is higher than it has been for some time and apparently stock cannot be had. In hardwood, conditions are about the same as they were during the same period last year. Crop developments are awaited with interest and most dealers are still holding small stocks, although it is expected that they will

A FLEET OF TUGS BRINGING IN A RAFT CONTAINING SEVERAL MILLION FEET OF LOGS

DRY PINE LATH

Are you in the market for lath? We have a nice lot of No. 1---4 foot Dry Pine Lath on hand which we want to move quickly. Write or wire at once for quotations.

Of course we are never without a dry stock of Norway and White Pine Lumber. As our mills run the year round we are always noted for "having the goods."

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"RUSH ORDERS RUSHED"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

A. F. Holden, Pres. J. M. Diver, Vice Pres. and Gen'l. Mgr. E. C. Barre, Ass't. Mgr.

order extensively in the fall. Shippers are busy getting out stock that has been on order for some time, and the mills are anxious to get their orders off so that they may cut stock for fall and winter. It is generally assumed that stocks will be found exceedingly light this fall and buyers may experience some difficulty in securing hardwood lumber. Birch particularly is scarce. This wood is used to a large extent by a great number of manufacturers and they are feeling the scarcity keenly. Prices have advanced considerably, but stock cannot be had.

The spruce market in Boston is dull, although the retail trade is fairly active. Frames are being sold at $24.50, although some dealers are asking $25. Random prices are steady with a number of good offers, 2 x 4 prices range from $22 to $22.50, with but very few sales. Lath and shingles are fairly plentiful, with a good demand and prices are normal. Cedar extras are commanding $4 in Boston, but a large number of sales are made at $3.90. Lath 1⅝-in. is selling at from $4 to $4.10, 1½-in. from $3.65 to $3.75. Red cedar shingles in Chicago are bringing $3.20 with stars at $2.70, and plenty of stock in sight.

Market Correspondence

New Brunswick News—Spruce in Good Demand

St. John, July 20th. (Special correspondence of the Canada Lumberman):—Spruce holds practically all the ground reported in the last letter. All mills are running full time, and if it were not that freights to U. S. points were almost impossible to get a great deal of lumber would be moving out of St. John to United States ports, but it looks at the present moment as if this state of affairs would continue for some time to come. Freight rates to New York are being quickly picked up at $4.00 on long lumber, and 80 to 85c. per M. on laths. Spruce random is selling in New York at $25 per M. base, for frames 8 in. and under, 20 ft. and under in length, with a corresponding raise in extra lengths or widths. Of course there must be a fair assortment of widths and lengths. Many inquiries are coming in and American buyers seem to be covering this territory pretty freely, and they seem to think that after first of September the price of spruce will be still higher, as many of the mills which have been sawing since winter will shut down; in fact, it is said that ten or twelve mills in New England have finished their cuts this week. Pine boards are in fair demand, in fact anything in box board, dry, would bring from $23 to $24 per M. delivered New England points in comparison with $18 per M. for the same stock a year ago. Hemlock is very scarce on this market, very few boards being offered, as nearly all hemlock produced in this section this year has and will be sawn into timber for the Canadian Pacific Railway wharves on West St. John.

Laths are being held very firm, at $2.70 on wharves; stocks are light as nearly everything has been shipped from this port and only what mills have produced for the last two weeks are on hand. This, we believe, will have a tendency to further stiffen prices. Eastern cedar shingles are being inquired for very freely, in fact the demand is away beyond the supply, and no chance of a fall in prices, as only a limited supply of cedar logs was cut in the woods last winter. The low grades are almost impossible to get, extras are bringing $3.90 to $4.00 per M. delivered New York or New England, with clears and 2nd clears at $3.60 and $2.75 per M.

A Slight Improvement in English Market

The English deal market continues in about the same state as before reported, although if anything it is in slightly better shape, as far as selling in St. John is concerned. One manufacturer has sold two million deals, fifty per cent. 7 and 8 x 3, balance 9 and up at fifty cents per M. over a previous sale made earlier in the season. We know of some small parcels of deals fifty per cent. 7 and 8 x 3, balance 9 and up, being sold to net $15.00 St. John. Further inquiries are being made by the English buyers for city cut stock but all manufacturers are holding for last season's prices and it is felt by winter that it will be obtained. The St. John River Log Driving Company are about half through rafting at their booms at Fredericton, practically all logs have arrived at booms at this date.

Personal and Trade News

Martin L. Brown, of the Woodstock Lumber Company, Boston, Mass., heavy buyers of eastern spruce, passed through St. John recently on his way to Northern New Brunswick. He reports the outlook for spruce to be good, and says that it will improve in early fall.

George McKean has opened an office in New York recently to take care of their fast-growing New Brunswick business for United States. It is to be hoped that they will be as successful in the American market as they have been on the English. It is said that J. E. Moore has let to the Aberthaw Construction Company of Boston, Mass., a contract to build for him at South Bay a concrete saw mill building 180 feet long by 50 feet wide, situated on the property Mr. Moore purchased from the Canada Woodenware Company.

Ottawa Trade Brisk—Prices Strong

(Special to the Canada Lumberman)

Ottawa, July 22.—With a steadily increasing demand since the opening of the summer season, the lumber trade in Ottawa and the Ottawa Valley is now very brisk with prices showing a marked advance over last year. Retail trade is exceptionally good, all the mills running at their full capacity and a good many of them overtime. Building is brisk and retail prices have taken a considerable advance in the last two weeks. American boat shipments are quite heavy, taking large quantities of lumber from the mills.

Spruce has advanced. Prices are very firm at from $1.50 to $2.00 over last year with every indication of their going still higher before the close of the present season. Hemlock is very strong, selling in lots of 100,000 or more. Present quotations are: 2 in. x 6 in. x 8 in. —10/16 ft. at $15.50; 2 x 10 in.—10/16 ft. at $16.50, which prices have increased considerably over last year. Lath, although plentiful, are holding their prices well, 1¼ No. 2 selling freely at $3.25, Ottawa.

The white pine market, although steady, has not shown any great advance, except perhaps in the finer grades, which have gone up from $1 to $1.50 over last year. Hardwood is selling freely at prices ranging from five to ten per cent. over a year ago. Indications point to a scarcity of basswood, on which prices will no doubt advance before the close of the season.

Shingles are also well in demand, all grades having advanced 25 per cent. per thousand.

The building trade is very active in the capital, but perhaps one reason for the increased demand for building material is the large number of summer cottages being built in the numerous resorts along the Ottawa river within a short radius of the city. These are almost invariably frame structures.

The J. R. Booth mills were shut down for a few days last week owing to a break in one of the giant flumes, shutting off the water supply. Mr. Booth himself, although 86 years old, worked night and day alongside his employees repairing the break.

Montreal Trade Continues Strong

Montreal, July 26—(Special Correspondence of the Canada Lumberman)—The market continues to be in a satisfactory condition and inquiries among lumbermen show that the volume of business is excellent. Certain lines it is practically impossible to obtain, and with prices stiffening buyers are being forced to purchase lumber of different quality and at lower values, although it is not so well suited for the required purposes. Thus, hemlock has come to the front, and is being substituted for spruce and pine wherever possible. One wholesaler expressed the opinion that the manufacturers, under stress of the big demand for lumber, are inclined to advance prices at too fast a rate, with the inevitable result that there will be a bigger rush than ever to find substitutes. Lath is keeping very firm, and with the immense amount of building that is going on throughout the Dominion, the chances are that prices will go higher.

Local business is very brisk, and as far as can be seen, there is likely to be a continued big demand.

Trade with the United States is a little slower than it was, due to the usual mid-summer dullness, but there is every reason to believe that it will again pick up. Stocks in New York are reported to be rather low. There has been an advance in freights, of from 25c. to 50c. per 1,000 feet, by canal boats from Montreal, Quebec, and Ottawa, due to the large amount of freight being offered.

Export business to the United Kingdom is fairly active, although more timber would have been shipped had not the cars been so slow in coming forward.

With regard to ground pulpwood, water powers in the United States are now reduced by one-third, and it is expected that the needs of the mills there will put them in the market for large quantities during August, September and the fall months. Shipments until now have been confined to contracts, but many fear a severe shortage in supply before fall rains come.

Sulphite pulp is scarce, and an advance of another dollar per ton in price is reported. Some increases in production have been caused by the additions to two of the Canadian mills, which will, with present output, take good care of the market.

News print is strongly held. Considerable enquiry from the United States has developed, but there is very little news to be had as contracts are taking the output of the mills. The Spanish River mill is now making ninety tons daily, and the Soo mill is about starting with 100 tons, while Price Bros.' new 150 ton mill will not be ready till October.

EDGINGS

Ontario

Mr. G. S. Richardson will add an $8,000 extension to his hotel at Mattawa, Ont.

John J. Haine's lumber mill and cooperage factory were burnt at Brigden, Ont., recently.

The Naylor-Osborne Co., Ltd., Essex, Ont., have absorbed the business of the Naylor Lumber Co.

The planing mill of H. Hope, 494 Concord avenue, Toronto, was burnt a short time ago. The total loss will be $5,500.

The Canada Lumber Company have purchased a large tract of land in Weston, Ont., and it is said that they contemplate erecting a large planing mill in that town.

Batts planing mills, Pacific avenue, West Toronto, was the scene of a small fire a few days ago. It was quickly extinguished, however, before much damage was done.

The Elliot Woodworker Limited has been incorporated with a capital of $40,000 to manufacture and deal in woodworking and other machinery, with head office at Toronto.

The biggest tow of logs that ever came into Penetanguishene Bay was brought in by the Firstbrook Box Company recently. The tow contained over 80,000 pieces of timber.

The Booth Lumber Company has just purchased 25 acres of land on the C.P.R. cut-off, south of Islington, Ont. A planing mill and lumber yard will be established on this property.

The plant and buildings of the Mann Lumber Co., Peterboro, Ont., have been purchased by Mr. A. H. Stratton. The plant is an up-to-date one, and is being put in first class condition for operation.

The planing mill of L. E. Hall at Port Hope was visited by a fire a few weeks ago. The loss will be about $1,500,000, fully covered by insurance. The principal damage was done to the machinery.

A. W. Yager, manufacturer of shoepacks, of Midland, Ont., recently moved into a new and much larger factory to meet the demands of his growing trade. He reports business this season as being better than for years past.

The Spanish River pulp and paper mill's output for the first six months of this year, shows a gain of some 5000 tons of pulp, ahead of the corresponding period last year. As the latter half of the year is the big production period, the increase in the first half would suggest a gain in production for the year of probably 25 per cent. more.

The White Machine Works Limited, manufacturers of saw, swages, shapers, etc., which recently started manufacturing at Windsor, Ontario are now in fine swing and have their travellers on the road covering the entire country. This is a Canadian branch of the well known firm of E. A. White Co., of Eau Claire, Wis. Mr. W. A. White is general manager of the Canadian firm.

The Mann Lumber Company plant recently purchased by the Peterborough Planing Mill Company, is being rapidly put into shape. Additions and alterations are being made, and the building is being converted into a most up-to-date mill. It is expected that the plant will be in operation in a week or so. Mr. A. H. Stratton, who is at the head of the new concern, is pushing the changes rapidly to completion.

A continuous downfall of rain in northern Ontario has probably been the means of averting many forest fires. Reports have been received by the government that fires, which have made small clearings during the past two weeks by their sweep, have been stopped by the rain. Forest fires have started in all parts of the undeveloped territories, but in no case have they been of serious nature, because of the rain.

Albert Hindle, a former employee of W. R. Kearn, who runs a sawmill at Robroy, Osprey Township, Ont., and who was injured in the plant three years ago, has been arrested, charged with arson, in connection with the recent burning of the large saw mill at Robroy. It is said that Hindle had his right arm rendered useless by an accident in the mill about three years ago, and that he has constantly threatened to get even. The saw mill was burned to the ground on July 5th last and Hindle is said to have been seen in the vicinity of the mill shortly before the fire.

A big timber deal was consummated a couple of weeks ago, when the Shevlin Clarke Company purchased the timber limits and holdings of the Seine River Company, known as the Hines Lumber Company. The tract of timber is situated in the vicinity of Steep Rock Lake and Barings, and extends south to Quetico reserve near Fort Frances, Ont. The consideration was said to be $2,000,000. The timber is all tributary to Fort Frances and can be delivered by water to the present mill of the Shevlin Company, who will in all probability increase their capacity by the placing of additional machinery.

The new district of Patricia has been fire-swept so often, according to a report of the Dominion Director of Forestry, that there is little merchantable timber left in that area. Out of 5,400 miles of country tributary to Oxford House, but 1,600 miles is covered with merchantable timber, while the remainder has been burned over. This country was originally richly forested with spruce, tamarac, jack pine, balsam, fir and poplar, but fire has practically swept all of them out of existence. In many cases, the ground has been fire-swept so often that the seed trees have been utterly destroyed. Most of the timber left is on islands scattered throughout the numerous lakes, some of the trees on these islands measuring from two to three feet in diameter.

Prominent business men of Bruce Mines, Thessalon and Blind River, Ont., waited upon the Hon. W. H. Hearst, Minister of Lands, Forests and Mines, recently, and asked that three townships be withdrawn from the Mississauga Forest Reserve and opened for lumbering operations. It was pointed out by the deputation that nearly all the townships upon the north shore of Lake Huron have been cut over and that only one lumbering concern re-

mains in operation, and also that, as over $1,000,000 has been installed in plant by the manufacturers, something should be done to hold them in the north country. It is claimed that, if the three townships in the reserve, one "A," one "B" and one "C," are opened for cutting, it will have the effect of reviving the lumber industry in the district.

Mr. J. R. Booth, although getting on in years, is still as active as ever. When the new floor in the huge flume in the Ottawa mill burst a few weeks ago, Mr. Booth was the first man on the job. He worked until midnight with his men and encouraged them, both by word and deed, to get the flume in proper running order again. "We cannot do anything with him," said his son, Mr. Fred Booth. "He is so interested in the work that we just have to let him stay here. He has ideas of his own as to how these repairs should be made, and is here to see them carried out." The huge timbers that were laid in the flume when it was built have been replaced by ten large steel stringers, and they will act as a base for the immense concrete floor that is now being laid. The new floor is said to be so substantial that it will hold seven times the weight of water that it formerly held. The steel stringers are being set on a rock, so that there will be no danger of the foundation giving way.

Eastern Canada

The Ideal Sash, Door & Lumber Co. have been registered at Montreal, Que.

Messrs. Clark & Co., lumber dealers, have been incorporated at Bury, Que.

The Emile Chouinards sawmill at St. Pamphille, Que., was destroyed by fire recently.

Messrs. Lombard & Marshall, lumber dealers, have been registered at Colebrook, Que.

Messrs. Ouellet & Dionne's sawmill at St. Onessime, Que., was burned out a short time ago.

The E. B. Eddy Manufacturing Co., of Montreal, contemplate extending their warehouses in that city.

The Lotbinier Manufacturing Co., manufacturers of sash, doors, et.c, has been registered at St. Croix, Que.

Canadian Pulp Mill Machinery Company, Limited, has been incorporated with a capital stock of $20,000 to manufacture all kinds of pulp mill and other machinery, with head office at Montreal.

La Campagnie de Progress De La St. Flavien Ltd., has been incorporated. They are capitalized at $50,000, and will acquire mills, and carry on a lumber business, with head office at St. Flavien.

National Steel Car Company Limited has been incorporated with a capital stock of $6,000,000 to carry on business as general merchants, lumbermen, sash and door manufacturers, &c., with head office at Montreal.

The Grier Timber Company Limited has been incorporated with a capital stock of $100,000 to carry on business as merchants and manufacturers or dealers in timber, lumber, and wood products with head office at Montreal, Que.

The Quebec Labrador Pulp and Lumber Co., Ltd., have been incorporated with a capital stock of $300,000. They will secure timber limits, and manufacture and deal in timber and lumber of all kinds, with head offices at Montreal.

The Gagnon Lumber Company Limited has been incorporated with a capital of $49,000 to carry on a general lumber business, to keep lumber yards and carry on business as builders, &c., with head office at Saint Georges de Beauce, Que.

According to a statement issued by the St. John's River Log Driving Co., up to July 1st, there has been 28 million feet of lumber rafted on the St. John river to that date. They further state that 110 million feet of logs have already reached the booms at Fredericton, and the estimate of 120 million feet to be handled during the year, will be exceeded.

At a recent auction sale held at Bathurst, N.B., the shingle mill of the former Nepisiguit Lumber Co. and the right to cut cedar on 495 square miles of crown timber lands was sold for $16,000 to J. Bennet Hachey, M.P.P., Bathurst, N.B. The rights of the Nepisiguit Lumber Co. and the bondholders in the Robertson property, 144 square miles of crown timber lands were sold for $1600, subject to a former agreement to purchase the same by the Nepisiguit Lumber Co. from John Robertson for $48,000, upon which $31,500 is still due and payable in 1914. The total purchase price of this part of the property was therefore $33,100. It was also acquired by J. Bennett Hachey. No decision has yet been reached regarding operating the property.

Western Canada

Messrs. Murrs & Leighton, proprietors of the sawmills at Princeton, B.C., have sold out to Messrs. Knudson.

The Robereson & Lequiene Lumber Co., Ltd., Grand Forks, B.C., are applying to change their name to the Western Pine Co., Ltd.

David Nevin's saw and shingle mills at Rosedale, B.C., are announced for sale. The mill cuts 10,000 feet of lumber per day and 25,000 shingles.

The British Canadian Lumber Co., mills at Queensboro, B.C., are rapidly nearing completion, and are expected to be in operation about the middle of August.

It is stated that R. F. Green, the new member from Kootenay, in the Dominion Parliament, will urge the imposition of a protective duty on rough lumber from United States.

The Franco-Canadian Timber So. has been licensed to carry on a general timber business in the province of British Columbia. The office of this company is situated at 35 New Broad street, London, Eng.

The plant of the Western Canada Sawmills, Saskatoon, was visited by a miniature cyclone a few weeks ago. Many of the lumber piles in the yard were scattered, and a portion of the mill was wrecked.

Commonwealth Lumber Company has been incorporated with a capital of $100,000 to carry on a general lumber and timber buisness and to deal in contractors' supplies of all kinds, with head office at Winnipeg.

Are your horses of use to you?

This seems an absurd question—and the answer is always **"Of course they are"**—In which case provide your stables with:

Johnson's Reliable Veterinary Remedies

Johnson's Horse Liniment, No. 1 (Alcoholic)

1 gal. jugs (Imperial)	$4.50 gal.
1 lb. bottles	8.00 doz.
2 lb. bottles	15.00 doz.

Johnson's Horse Liniment, No. 2 (an oil liniment)

1 gal. jugs (Imperial)	3.00 gal.
1 lb. bottles	6.00 doz.
2 lb. bottles	11.00 doz.

Johnson's Horse Colic Remedy

A sure and speedy cure for all kinds of Colic

1 gal jugs (Imperial) 40 doses	5.00 gal.
1 lb. bottles 4 doses	8.00 doz.
2 lb. bottles 8 doses	15.00 doz,

Johnson's Veterinary Healing Ointment (Gall Cure)

2 lb. tins	2.25 per tin
4 oz. tins	3.50 doz.

Johnson's Condition Powders (Concentrated)

1 lb. Packages	3.60 doz.

Johnson's Camp and Household Remedies, such as Cough Syrup, Healing Ointment, Headache Powders, Big 4 Liniment, Stomach Bitters, Cathartic Pills, etc., etc., have stood the test of twenty-five years and are in use all over Canada, from the Atlantic to the Pacific. Prices are lower than those of all other manufacturers. Letter orders receive prompt attention.

A. H. Johnson, Wholesale Druggist, **Collingwood, Ont.**

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

The New "Defiance" Knife Balancing Machine

What is said to be the only machine capable of securing an absoluely perfect balance to all classes of knives of every size and shape, revolving cutters, knife-screws, etc., is herewith illustrated and described as the "Defiance" Patent Proportional Knife Balancing Machine. This machine is too well known to the users of machine knives to require a lengthy description.

Knives could be reduced to the same specific weight by the aid of a common grocers' scales, but that would not attain the object; by the use of the Proportional Balancing Machine the position, as well as the amount of excess of weight, can be ascertained, so that in reducing the knives to the same specific weight they may be made to agree in their corresponding parts. The method hitherto used is by reducing pairs or sets of knives to the same dimensions, and by the aid of common scales to the same specific weight; but so great are the differences in the density of the parts of even the same knife, that a still running set of knives is but an accidental result.

In operating, let it be supposed that two or more knives are intended to be fastened onto one cutterhead, rotating at a high velocity, and that it be conceded that they must not only be of the same specific weight, but must agree in their corresponding parts. Place each knife in succession on the platform of the balancing machine, with its face toward the end-board; with a suitable weight, at the opposite

Patent Proportional Knife Balancing Machine.

end of the beam; if by this test they all appear to be of the same specific weight, place them each in succession again, with their backs against the end-board; they may still appear to be of the same specific weight; place them each in succession flatwise on the platform, in as many different positions as they are susceptible of noting and reducing by an indefinite number of trials the edges which are found to be of excessive weight, until they all are reduced to the same weight in their corresponding parts. They will also then, of course, be of the same specific weight. The balance weights are made oblong, so that by putting the heavy end up, the entire mass, consisting of weight, beam and knife, may be poised near its centre of gravity, and thereby oscillate more sensitively. If, however, the object to be balanced be very heavy, the weight must hang down, or the upper portion of the mass may preponderate. It will be seen that the operator can make the poise more or less delicate, according to the varied positions of the knives to be balanced.

Further information and price relative to this valuable little machine will be gladly furnished by the manufacturers, the Defiance Machine Works, Defiance, Ohio.

The E. Long Manufacturing Co. Secure Important Contract

The E. Long Manufacturing Company, Limited, of Orillia, Ont., have recently been given the contract for the complete installation of machinery in the portable and stationary sawmills now being erected in the townships of Kendry and Haggart, Northern Ontario, as a part of the big colonization scheme undertaken by Willis K. Jackson, the millionaire lumberman, of Buffalo, N.Y., who recently purchased over 100,000 acres in the north. The large mill will have a capacity of 50,000 feet per ten hour day, and will be equipped with every modern improvement in the way of machinery.

B. Greening Wire Company's New Catalogue

We have received from the B. Greening Wire Co., Limited, Hamilton, Ont., an advance copy of their Wire Rope catalogue—an attractive, well illustrated booklet containing a concise description of the company's various lines in their wire rope department. This catalogue embraces practically every kind of wire rope used and its value is enhanced by the practical directions as to how to care for and use wire rope, showing the best kind of rope to use for various purposes. The products of the B. Greening Wire Co., Ltd., have long been recognized as standard in quality. The company have one of the finest manufacturing plants in the Dominion and everything that enters into their products is of the highest class material obtainable. Every condition where ropes are used has been a subject of careful research and study, always with a view to giving the consumer the article best suited to his particular requirements. Apart from its value to the trade this catalogue has an educational value, which the progressive reader will not likely pass over. Copies will be forwarded upon request to the company.

Important Agency Obtained by Canadian Fairbanks-Morse Co.

The Canadian Fairbanks-Morse Company, Limited, has secured the Canadian agency for the Orenstein-Arthur Koppel Company, of New York, consulting engineers and manufacturers of portable railways, industrial railways, narrow gauge sidings, narrow gauge public railways, and railway equipment of all descriptions. The works of the Orenstein-Arthur Koppel Company are located at Koppel, Pa. They have been in business thirty-five years and have built and developed industrial and narrow gauge railways of every description in all parts of the world. Their catalogue No. 400 covers their line very comprehensively, a copy of which no doubt can be obtained from the Canadian Fairbanks-Morse Company, Limited, of Montreal.

Pioneers in Double Band Cutting

The first double cutting band saw operated in Canada is in the mill of the J. D. Shier Lumber Company, of Bracebridge, Ont. It is one of the old Atlas make and was installed fourteen years ago. It has been running continuously ever since and Mr. Shier is a strong advocate of the double band saw over any other kind, claiming that it saves both in time and in lumber. The Shier mill has a capacity of from 35,000 to 40,000 feet per day. Besides the sawmill the company have a planing mill at this point which takes care of the large business they do around the Muskoka Lakes. Shipment of their sawmill stock is made by rail. Although well up in years, Mr. Shier is still very active and directs the mill operations personally. He is assisted by his four sons, who are with him in the business.

New Fay & Egan Catalogue

J. A. Fay & Egan Company, manufacturers of "The Lightning Line" of woodworking machinery, have just issued a new catalogue which is of interest to every owner and user of woodworking tools.

This catalogue, known as No. 86, is gotten up in a size convenient for handy reference and in its 352 pages are illustrated and described all of the many improvements made in woodworking machines during the past year.

The catalogue is really a text book on woodworking machines, and is evidently an expensive proposition to print and circulate. The Fay & Egan Company advise us, however, that they will be glad to send a copy, charges prepaid, to any owner or user of woodworking machinery who will address them on his own or company's letter-head as follows: J. A. Fay & Egan Company, 465-485 West Front Street, Cincinnati, Ohio.

The great forest fires which unfortunately occur almost every autumn, leave vast quantities of fire-klled timber. This timber is now being used extensively for many purposes, it being preferred in some cases to green lumber. Fruit growers are said to prefer it for packing boxes as it preserves the natural flavor of the fruit. Telephone poles and railway ties are also made from the fire-killed timber.

The Dominion Government recently passed an order in council forbidding lumber operators to float loose logs in the Muskoka River. It is presumed that the order is in the interest of owners of motor boats who make extensive use of this river. Unfortunately, however, the prohibition will be a serious hardship to the owners of sawmills who make use of the river for driving their logs.

Fifty-six per cent. of the pulp wood cut in Canada during the year 1911 was exported to United States. This fact is shown by the statistics collected by the Forestry branch of the Department of the Interior.

"AMPHIBIA"

(WATERPROOF)

Leather Belting

costs you less per day of service

it is therefore the least expensive belting---irrespective of "first costs" comparisons. Remember this "service-per-dollar-invested" basis when you tote up your belting expense.

Testimonials from practical men who have personally investigated the process:

MR. CHARLES HADLEY, PRESIDENT OF THE S. HADLEY LUMBER CO., CHATHAM, ONT., writes:

"In answer to your enquiry as to my opinion of the vulcanizing and drying of wood under the 'Howard Process,' the piece of Norway Pine you sent me bearing your name has been thoroughly tested by the foremen in the different departments under my instruction, and I find that the wood that has been vulcanized is thoroughly dry and left free from any smell of dampness and the heart left in a sound condition so as to admit a very high polish. In working the **wood with the different machines it passes through as smoothly as** the old-fashioned cork pine; a sticker, a shaper or a planer, in my opinion, will plane more and leave the wood smoother than the ordinary dry pine, leaving any of the defects in the wood in a shape that will not tear or lift.

"Then another great advantage, it does away with carrying the wood for one or two years on sticks before kiln-drying, saving of all of the labor and piling, the ground space, and the interest on capital invested, insurance and other expenses in carrying the stock we have always had to carry, also the great saving over the ordinary way of drying on sticks, the loss by deterioration, which is no small sum.

MR. JAMES INNES, OF THE SUTHERLAND-INNES COMPANY, LIMITED, CHATHAM, ONT., one of Canada's important cooperage manufacturers, wrote on December 9th, 1911, as follows:

"I visited the plant of the Lumber Vulcanizing Corporation of Canada at the Don, Toronto, on the 24th ult., and looked into the process. I examined Gum Tight Staves, Lumber and Square Timbers which had been through the Cylinder and they appeared to be thoroughly dried without checking or warping and without discoloration; in fact, as bright as new sawn stock.

"The results accomplished in the short time necessary for treating are most satisfactory, and, in my opinion, the process has great merit."

MR. EDWARD CLARK, OF EDWARD CLARK & SONS, Lumbermen, Toronto, under date of July 27th, 1911, wrote as follows:

"In answer to your request for my personal views as to your vulcanizing process, will say that some months ago I went to your plant located in the Don Valley, this city, and saw 1-inch Birch, green from the saw, run through your process in twenty-four hours.

"Your process dried the wood thoroughly and the boards came out in good shape, being free from warp and check.

"I personally marked some of this lumber before it was placed in the Cylinder, being particular to know of my personal knowledge that the lumber treated was the same as that which I had seen go into the Cylinder.

"It is my opinion that there is a big field for your process in Canada, and if properly handled should prove a success."

I have only a limited amount of this stock for sale at what I consider a very attractive price. Call and see me, or write at your earliest convenience. Do not let this opportunity escape.

This is not Treasury stock as the Company is not offering any of its shares.

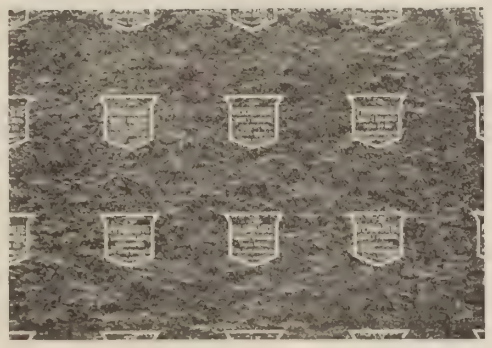
J-M Permanite Sheet Packing Is Pressure Proof



Asbestos—the highest grade of long-fibre asbestos—forms the foundation.

To this, specially prepared compounds are added that give it pliability.

The finished packing—J-M Permanite—will, as a result, pack permanently tight any joint. No blowing, burning, rotting or squeezing out where J-M Permanite is used. And it has the added advantage of requiring no following up.

In actual service it will last much longer than other sheet packings.

For high or low pressures and superheated steam in cylinders, steam chests. steam and ammonia lines, acids, alkali and sugar solutions it has no equal.

Try J-M Permanite—test its merits yourself—it will show you real packing service.

Shimer Cutter Heads and Cutters!

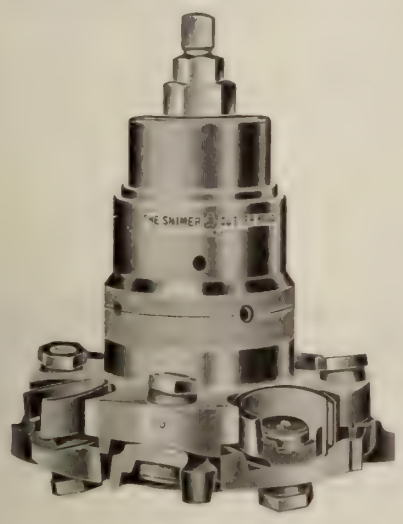

Fig. 627

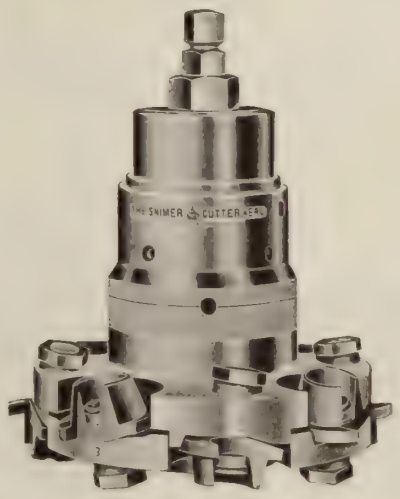

Fig. 628

The "Shimer Limited" with Expansion, price $72.46 per set, complete

The Ultimate Cost

of your Cutter Heads is the thing to be considered: that is the sum of the first cost plus the cost of maintenance. Sometimes the Ultimate Cost of a tool is twice or many times the first cost. Just when that time will come depends upon its wearing power or its liability to break and cause damage.

"Quality" has always been a special feature in Shimer Cutter Head construction and has been the means of keeping down the cost of maintenance. This quality feature of the Shimer Cutter Heads has been growing with the variety of tools put upon the market, until almost invariably wherever the name Cutter Head is mentioned the mill man is sure to think of the **Shimer** Cutter Head.

These tools are made for many varieties of work. For matching Flooring, Ceiling, Wainscoting, etc., they are made to suit machines from the slowest to those taking stock 150 to 170 lineal feet per minute, and are sold at prices ranging from $26.00 per set for Figs. 1 and 2 to $72.46 for our Shimer Limited Cutter Head made especially for the fast feed matcher.

For any work you get out in quantity we can furnish tools that will save the "make-ready" time, lessen the amount of material going into the offal pile and turn out a quality product at a saving that will soon pay for the tools.

Let us know your Cutter Head conditions. We are sure we can serve you acceptably, as we have so many others, in making either regular or special tools for your particular work.

Write us now!

Popular Cutter Heads

The most popular of The Shimer Cutter Heads are Figs. 202 and 203. The Bits are held within conical duplex bit seats, self-centering, arranged with the very complete Expansion feature for the fine adjustment of tongue and groove thicknesses.

Price with 4 bits to each head, the set $40.95
Price with 6 bits to each head, the set 49.27
Price with 8 bits to each head, the set 57.60

Complete with Flooring Bits. The Heads will also receive Bits for thin Ceiling—⅜ at $1.05 each and Bits for 2-in. thick plank at $1.63 each.

Jointer Heads

For jointing plain edges we make several styles of Jointer Heads provided with shearing effect to produce the easiest and at the same time the smoothest work. Made of Steel Forgings they supply the strongest and best. Our very reasonable prices put the tools within the reach of all.

Price, with 4 bits to each head, the set, 1¼-in. $31.20
Price, with 4 bits to each head, the set, 2-in. 33.28

Ship Lap Heads

to give you the best service must be of a kind that is always ready and in interchange with matcher and other Heads you may have fitted to your machine, thus avoiding a change of machine guides. This is one reason why the Shimer Ship Lap Heads are so generally used. The other reason is that they do work so satisfactorily that all who know their convenience take them in preference to others.

Price, with 4 bits to each head, the set, 1½-in. thick, $34.84
Price, with 4 bits to each head, the set, 2½-in. thick 35.88

Double Ceiling Heads

These heads have a special design to suit the purpose of double tonguing and grooving, with overlapping of the bit cutting edges to produce perfect clearance and to protect the leading points from unnecessary friction and wear.

They double the capacity of any matcher or moulder and provide a means of turning out single surfaced ceiling or flooring upon the most economical basis.

Price, Double Ceiling Heads complete with Bits, net, $40.94

Door, Sash and Coping Tools

That save all the hand fitting. No changing of patterns, therefore, no trouble in framing the door and sash parts when they are matched up with the Shimer Cutter Head. We relieve you of that detail of the business when we place the mould in counterpart within the contour of the Bits. The Bits are filed only to sharpen and being set by means of a gauge give accurate and uniform results. Prices very reasonable.

Reversible and One Way Cutters

The Shimer Reversible Cutters for Single Spindle Shapers, Variety Moulders or Friezers, are carefully moulded opposite to the shape of the mould to be produced, in such a way as to have only the cutting edge touch the lumber. They are complete—inexpensive—time saving. We also make One-Way Cutters for the Double Spindle Shaper.

Thin Steel Knives

Advanced ideas referring to the planing and surfacing of lumber have developed into the use of the thin blades, made from high speed steel, which when properly tempered and treated, serve for one or two days of work on hard maple, oak or hickory.

These blades are known as our Bedee Knives and are recommended by users as the best that can be procured. For the benefit of those desiring to use this style of a knife we have facilities to furnish them in any length or thickness.

Write us about your requirements.

Can you say as much as this about the Matcher you are using?

E. B. Foss & Co.
WHITE PINE LUMBER
LATH & SHINGLES
ESTABLISHED 1877.

Bay City, Mich. April 24, 1912.

J. A. Fay & Egan Co.,
Cincinnati,
Ohio.

Gentlemen:-

As we are more than pleased with the #333 High Speed 15" Planer and Matcher we think that you are entitled to know what we think of this machine, which has been in operation in our mill daily for several months. Your representative when selling us this machine lead us to believe that it was a wonder and would do whatever any other fast machine would do and then some. We have found from actual test that this machine is a wonder and will do anything that any machine could be expected to do. We have been running from 210 to 225 feet of White Pine lumber per minute and have not lost any time on account of hot boxes or any other reason. It is a common occurrence for us to run 25,000 feet of 10" Double Beaded Ceiling in 3 hours. We found this machine to be very simple in setting up and not as complicated as we thought it would be. You can rest assured that when we are in the market for anything in the fast machine line that your machines will have first chance.

Yours truly,
E. B. Foss & Co.

THE ONLY LOG-LOADER

"IT HANDLES ANY SIZE LOGS!"

That allows empties to pass through on the same track without jacking up the loader on spuds.

The McGIFFERT Steam LOG LOADER

It is self-propelling, moves and spots its own cars, dispensing with the services of a road engine.

It cuts the cost of logging some 66⅔: We would like to send you a book of facsimile letters that PROVE this.

A beautifully illustrated book, fully describing the working of the McGiffert and the immense savings it makes possible, awaits your request for **"CATALOGUE M."**

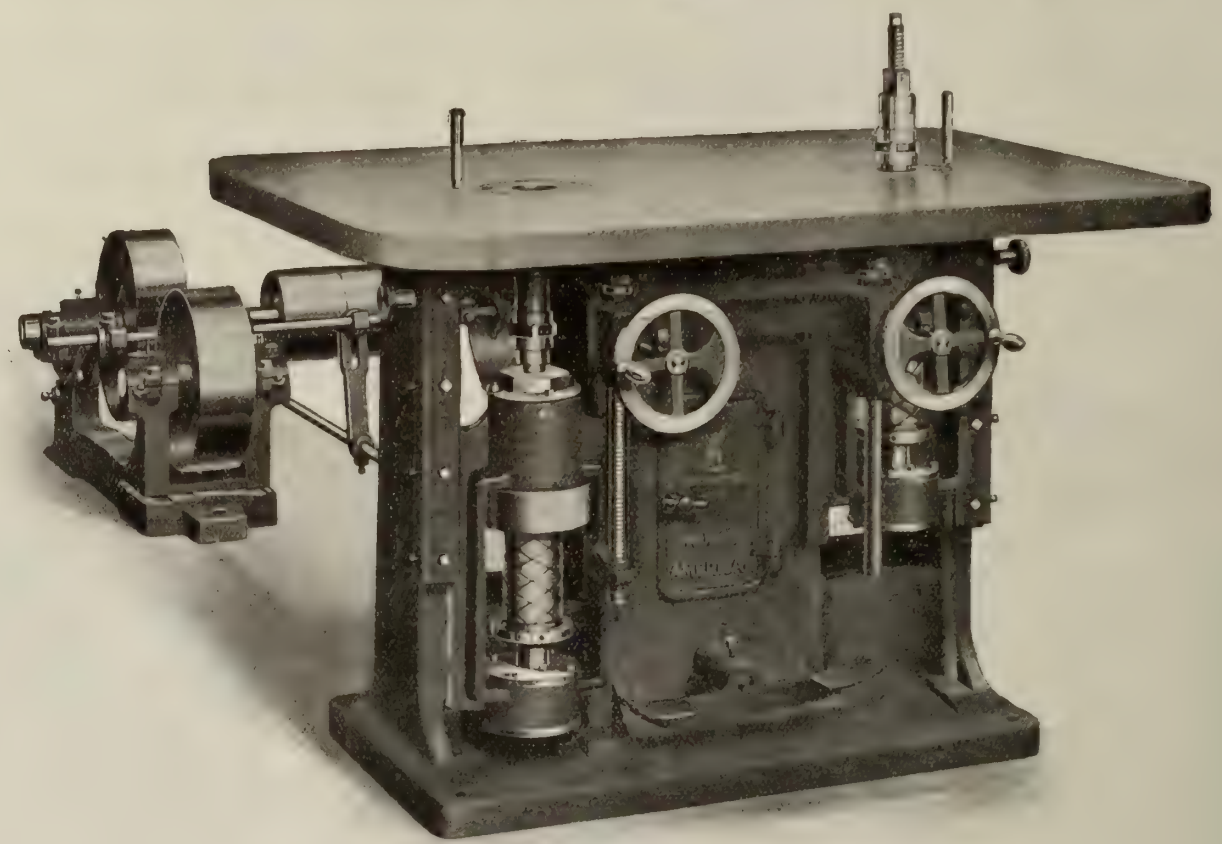
The American High Speed Ball Bearing Shaper



Running at the rate of 7200 revolutions per minute and with absolutely no vibration, produces the finest work obtainable on a Shaper.

High Speed is absolutely essential to fine and accurate cutting—you have it in an American Ball-Bearing machine.

We haven't discarded the taper bronze bush; you can have an American Shaper built that way if you wish, but we'll tell you frankly that the Ball-Bearings are better.

It is Better to Buy

the best; this applies to anything one needs, but especially do you require

Good Machinery and Supplies

The best is none too good, at any time, and while it perhaps costs a little more at the start, it is the cheapest in the end. The price paid for a cheap article, is probably not only all it is worth, but a great deal more, so it is wiser to get the best,

Than to Wish You Had

Think it over, then send to us. **AUSTEN BROS., Limited, Halifax, N.S.**

PROFIT by the Experience of Others

Thousands of firms throughout the continent testify the efficiency and economy of Beardmore Belting.

The price of their experience was the cost of a cheap belting, resulting in stretching and consequent loss of power.

Beardmore Belting has made enormous savings of power in power plants all over the country.

The maximum value is put into every piece of belting we manufacture.

The old fashioned oak tanning of No. 1 Packer Steer Hides produces a leather unequalled for solidity and tensile strength.

The utmost stretch is taken from the leather by improved methods which without injuring its life give the greatest belt efficiency possible.

Get information about Beardmore Belting.

It may mean much help to you in the long run to send for catalogues now.

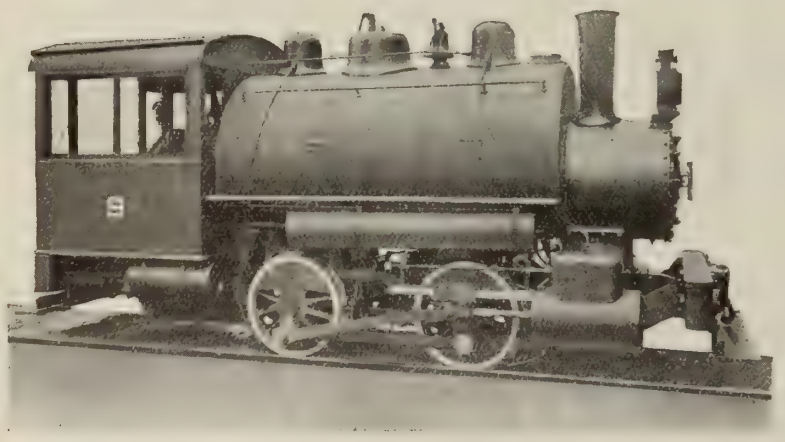
INDUSTRIAL LOCOMOTIVES

FOR BURNING COAL, WOOD OR OIL



Our locomotives are not built for one job only. They are built to last for years in the hardest service with a minimum expense for upkeep. This is the only proper way to build them.

Facility for making repairs when parts wear out was carefully considered in the design of our standard locomotives. Every detail is made with a view to securing the greatest possible reduction in the expense of repairs. Interchangeability reduces the time the locomotive is idle when repairs are necessary, as like parts will fit any other locomotive of the same size and design.

Consider the reduction in your profits when your locomotives are waiting for repairs.

Interchangeable parts, sure to fit, are kept in stock at all times and can be shipped at short notice.

MONTREAL LOCOMOTIVE WORKS

Dominion Express Building, MONTREAL, CANADA

Makes It's Mark Vivid and Lasting

Marks that remain vivid and wear like iron are a real satisfaction to the man who handles lumber. The metallic pigments, like graphite, of DIXON'S LUMBER CRAYONS offer marvelous resistance to all kinds of weather conditions. Their marks are often visible after six months of severe exposure to sun and storms.

DIXON'S LUMBER CRAYONS

have always remained the recognized standard because of their one, uniform and dependable quality; their convenient and uniform shape and size and because of the careful selection of materials used in their manufacture. DIXON'S LUMBER CRAYONS are made in nineteen grades and colors, including black (six grades), red (two grades), blue (two grades), green, white, yellow, brown, terra cotta, violet, pink and orange. Some are made to fill particular needs—let us tell you more about them. Get acquainted.

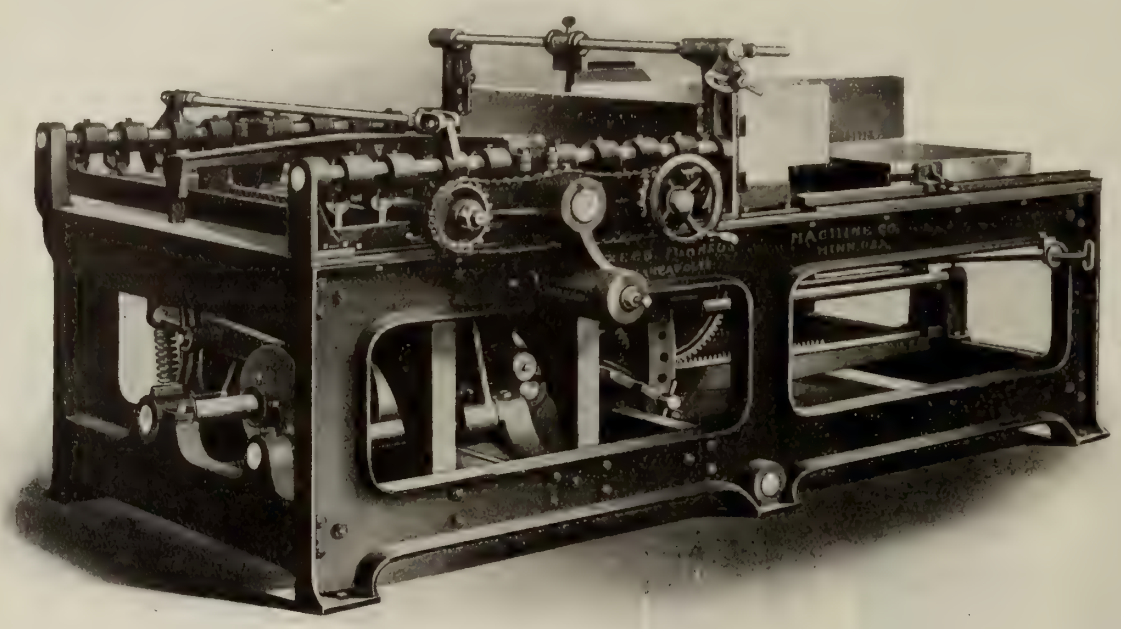
BOX MAKING MACHINERY



IS We are specialists in the building of box making machinery, and we have designed and built machinery for the foremost box factories of America.

The illustration shows our Automatic Box-Board Squeezer. It is built in four sizes and will assemble all kinds of matched stock used for packing boxes.

This machine can be changed to handle entirely different sized stock in two minutes. It saves labor by making the tonguesand groovesfit tight.

WE ALSO MANUFACTURE:

Horizontal Slab Resaws, Horizontal Hopper Feed Box Resaws and many other Special Box Factory Machines.

Mereen-Johnson Machine Company, MINNEAPOLIS, MINN. U. S. A.

JOHNSTON RE-SAW is a Lumber Saver and a Money Maker

The advantages of this machine over all others are;—1st—As a lumber saver using 10 and 12 gauge saws; 2nd—Can be set instantly to cut lumber from ½ inch to any thickness up to 4 inches: 3rd--Has screw adjustments so that thickness can be varied 1-12 of an inch under or over standard thickness, 4th—Automatic adjustment to prevent saw burning by slivers catching; THE FRAME being heavy is very rigid, so that saws can be run at high speed without vibration; THREE POINT driven; Three return live Rolls 8 inch by 20 inch automatic feed; Two grooved Rolls 8 inch diameter; one 16 inch adjustable Roll grooved; all gear: Power required 20 to 30 h.p: Weight 6,500 pounds: Floor space 8 feet by 9 feet 3 inches:

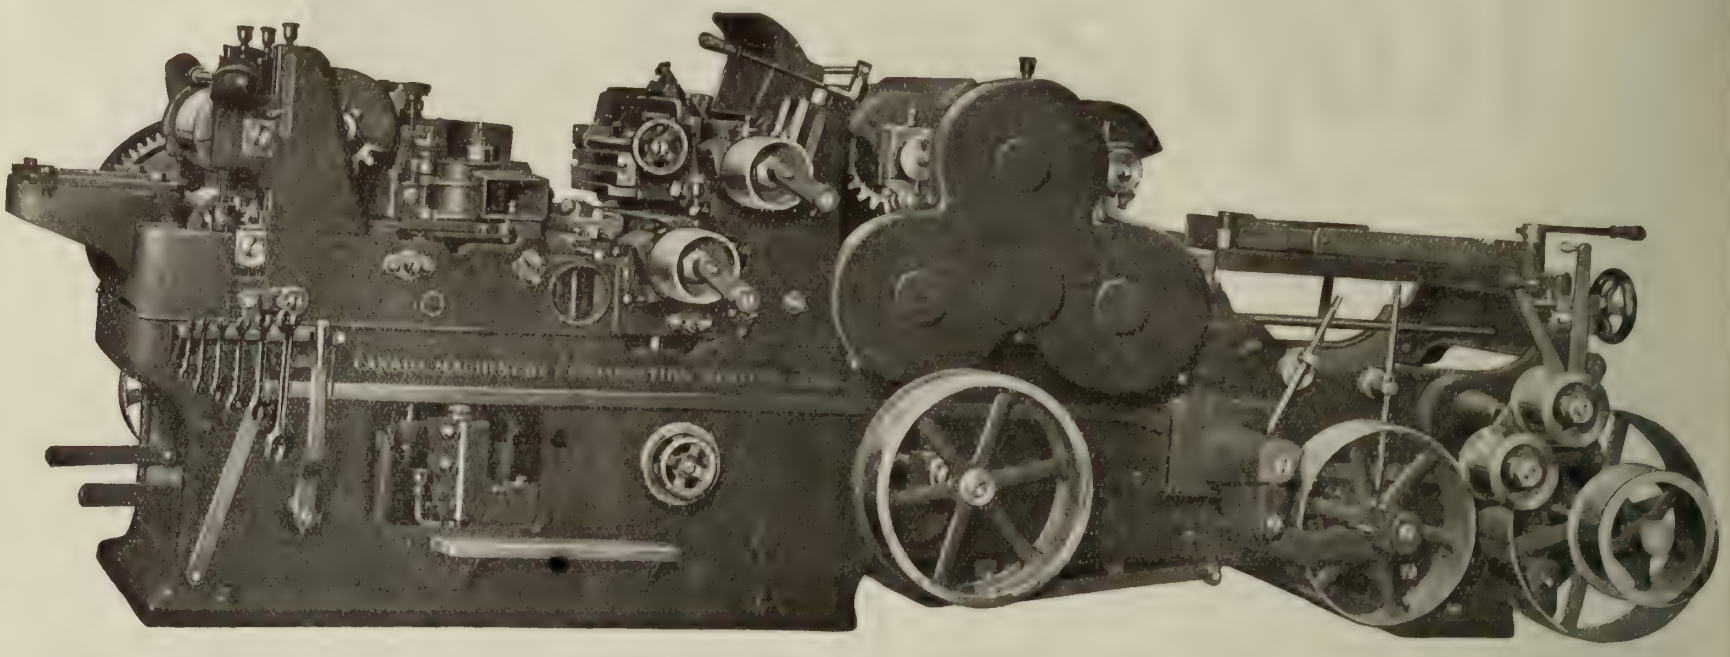
No. 122 MATCHER

C.M.C.

No. 122 MATCHER



C.M.C. No. 122 Heavy Duty Fast Feed Planer and Matcher

CYLINDERS both top and bottom are of the round type equipped throughout with high speed knives.

SIDE HEADS either of the round type or of the Shimer pattern can be supplied as desired.

FEED consists of six 12 inch rolls under spring tension driven by accurately machine cut gears carefully guarded.

ALL DRIVES are either by belt or gears no chains being used to give constant trouble.

BELTS are all long and driven from a self contained counter shaft attached to the main frame, and are all tightened by one lever.

WORKMANSHIP is of the highest class.

PERFECT WORK is guaranteed at a speed of 200 feet per minute.

PROFILING ATTACHMENT can be fitted at the delivery end of a machine for making drop siding, casings, base board, etc.

JOINTING DEVICE can be supplied for truing irregular surfaces.

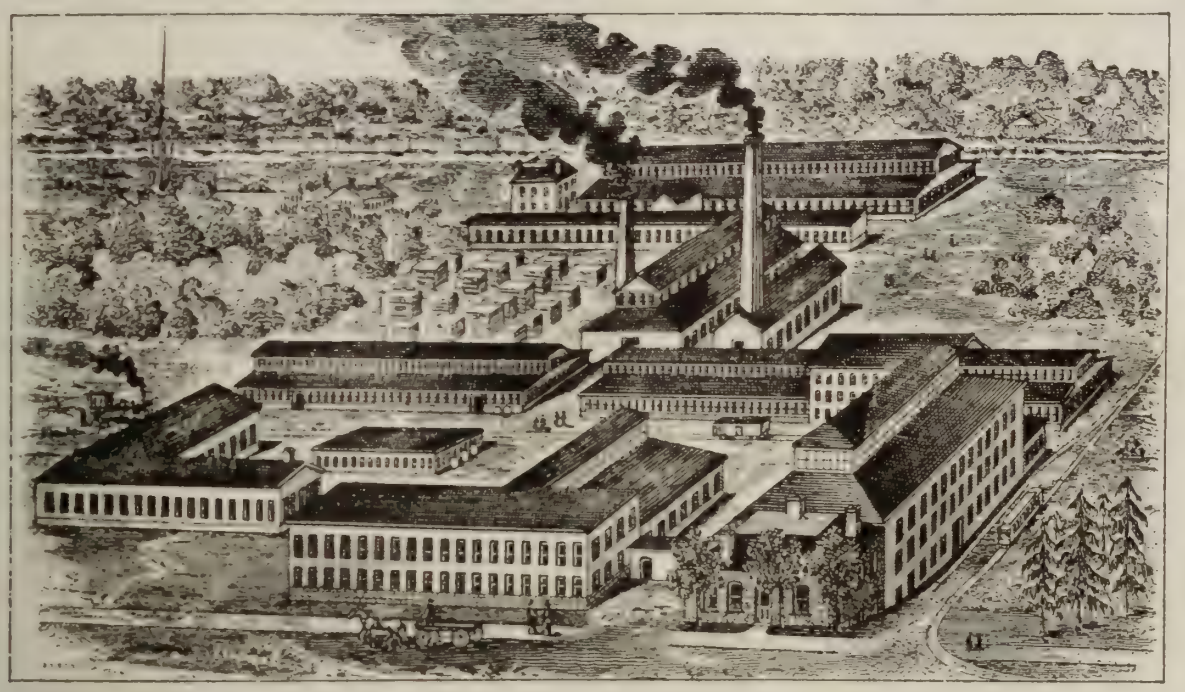
MAPLE LEAF SAWS

The Improved Racer Cross Cut Saw, by Actual Test, is the Fastest and Easiest Cutting Saw Made



The Maple Leaf saw is higher priced than the ordinary saw because it costs more to make it. It is made of the very highest quality of steel and tempered by a secret process which toughens and refines the steel. The Maple Leaf trade mark on the saw means that it is the equal, if not superior to any saw made. It also means that you are privileged to test it against any other make and if not found equal or superior in quality you can return it and have your money refunded.

The ambition of the manufacturers of the Maple Leaf Saws has always been to produce the best tempered saw in the world and they are constantly investigating and experimenting with this end in view. They have recently made some valuable discoveries in evenness of temper. It has always been difficult to get a perfectly even temper on long and thin sheets of steel, such as saws are made of. Our recent discoveries make this an absolute certainty. Every user of saws should bear in mind that the temper of the saw is its most valuable quality. High finish and attractive appearance amount to nothing if the temper is not right.

All Maple Leaf Saws are Guaranteed to be Perfect in Temper

Shurly-Dietrich Co., Limited Galt, Ontario

"JUMBO" Combined GANG and EDGER

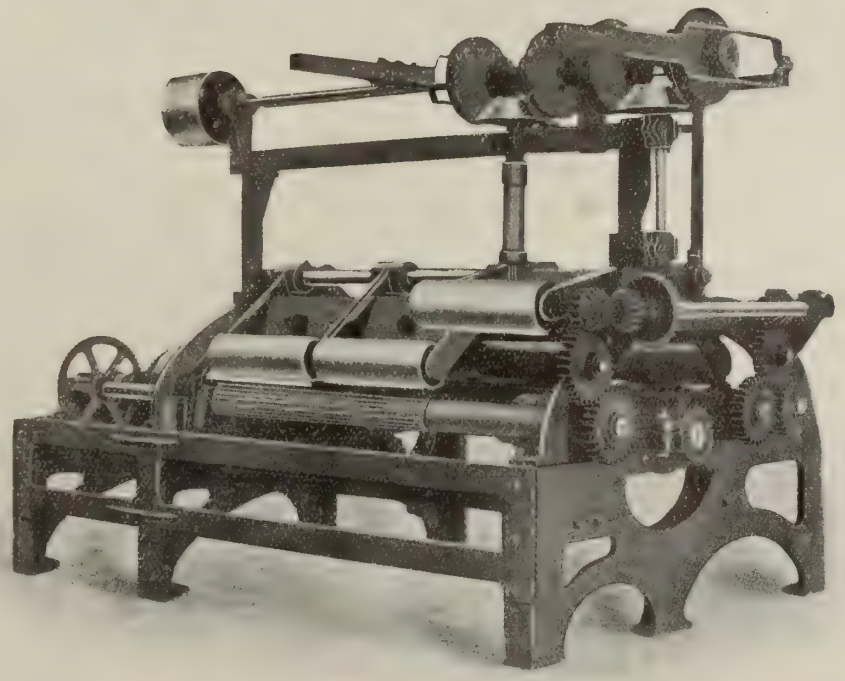
This is a very complete machine and embodies every detail of construction essential to an adequate gang edger.

We have some very flattering testimonials for our "JUMBO".

Mandrel: 4½ inches by 10 feet 6 inches long.

Drive Pulley: 20 inches by 20 inches.

Saws: 2 movable saws on edger side (more if desired) 8 stationary saws on gang side, 2 water boxes.



Our latest model is an improvement on the one illustrated above.

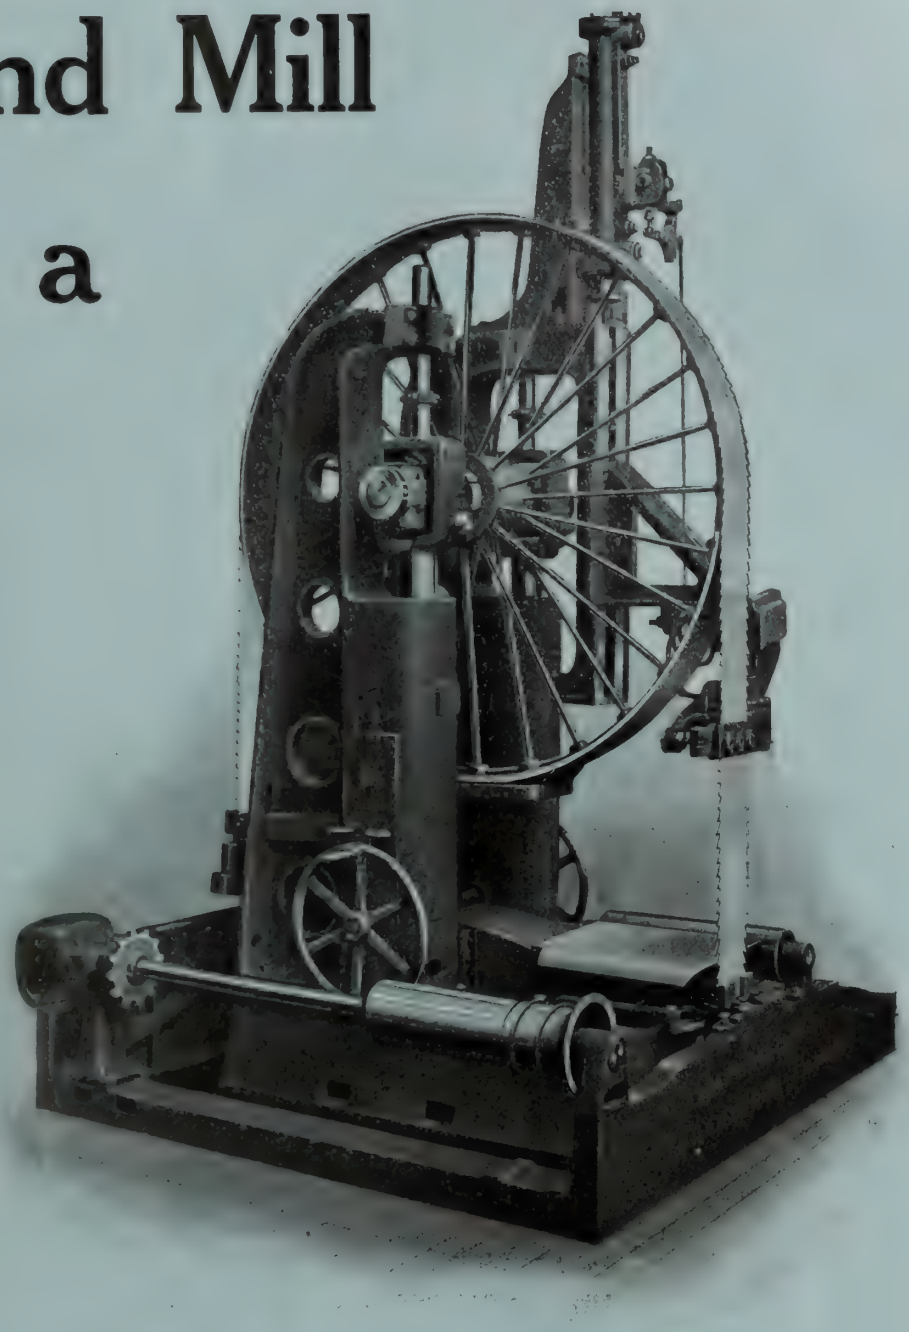
WINNIPEG—Stuart Machinery Co., Ltd.
EDMONTON and CALGARY—Gorman, Clancey & Grindley, Ltd.
VANCOUVER—Robert Hamilton & Co.

A 7-ft. Band Mill Built With a Purpose.



The Waterous 7-ft. Bandmill was built with a purpose—to handle logs larger than can be economically cut on a 6-ft. Pony Mill, to cut faster than the Pony, and at the same time to be less expensive than the heavy mills which have been used to do this fast cutting on medium-sized logs.

The Waterous 7-ft. Bandmill takes a saw from 14 to 12 gauge up to 12-in. wide. It will split a 36-in. log. It has all the fast cutting features of our 8, 9 and 10 ft. mills, and at the same time represents a saving of several hundred dollars in initial expense, in up-keep of saws and in filing tool equipment.

The saving in initial cost is made possible by the fact that the expensive experimental work and the testing out of the fast cutting features—the spring cushioned tension device, the double cutting guides, the steam raising and lowering attachments, etc.—has already been done on our heavier mills. All you pay for is the cost of construction.

Upper and lower wheels being much closer together than on these larger mills, the saw blade is held stiffer in the cut, with the result that the 7 ft. mill can be crowded to the limit and still turn out perfect lumber. On similar sized stock, it will out cut the 8 ft. mill any day in the week.

This photo and these dimensions tell the whole story——

Frame—7' 8" x 8' 3" over all.
Wheels—7' diameter, 9" face.
Lower Mandrel—4-3/8" diameter, **Bearings**—16" long.
Upper Mandrel—3-3/4" diameter, **Bearings**—14" long.
Saw—Up to 12" wide, from 38' 7" to 40' 6" long; Speed—455-ft.
Distance between wheel centres—8' 2-1/2" to 9' 2-1/2".
Driving Pulley—40" x 17".
Will Split 36" log, 26" cant.
Guides will open 42" apart, can be approached to 12".

WRITE FOR PARTICULARS

B. J. COGHLIN CO., Limited ∴ ∴ MONTREAL

Alphabetical Index to Advertisers, page 60

Did you ever really figure what it means to you to increase your cut 2,000 feet per day?

That is, increase it 2,000 feet per day without adding to your cost of sawing.

Or, in other words, what effect will it have on your profits if you can distribute your overhead charges and wages over an output 2,000 feet per day greater than it is now?

If you haven't figured it out, take your pencil and try it now.

You know how much it costs you to run your mill every day—divide that amount by the number of thousand feet per day in your present output—add 2,000 feet to your present output and divide your daily cost by that amount—and the difference between the two results represents the saving per thousand feet in your operating cost.

Then multiply that figure by your total output per season—and we think the result will surprise you, if you have never looked into this before.

This is just one of the ways in which our FOUR INCH STEAM SET WORKS will make money for you, and it will do just this because the users themselves have written us stating that they have increased their cut ***upwards*** of 2,000 feet per day.

May we send you further information about this Steam Set works?

There's Satisfaction in Ordering These Quality Grades of Lumber

If you're depending upon a supply of lumber you must get your orders in before the fall or you will be up against car shortage—a serious question.

Last spring it was bad enough, and even now there is a scarcity of cars—what will it be when the West begins to move this year's wheat crop?

For Fall and Winter requirements place your orders now and make sure of getting August and September shipments.

Right now we are ready to supply your every demand—at lowest market prices, in

HEMLOCK 1 x 4" and up, 1 x 6, 1 x 8, 1 x 10, 2 x 6, 2 x 8, 2 x 10

SPRUCE 1 x 4, 1 x 5, 1 x 6, 1 x 7, 1 x 8, 1 x 9 and 1 x 10

We can also fill orders, in any quantity, of **White Pine**—the finest well-watered stock obtainable. Always ready for shipment. We can dress or resaw.

Timber Limits for Sale on Georgian Bay

The undersigned offer for sale in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; Tug Scow and other Lumber Equipment, including boom chains, plows, sleighs, etc.

The Limits, part of which have recently been sold, include: 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

The Parry Sound Lumber Co., Limited

1315-20 Traders Bank Building, TORONTO, CANADA

THE trend of trade is now towards our **CUTLER** Mills, when customers want anything at **BAY** ports for water or rail delivery, and our **LUMBER** is selling itself by repeat orders from any **COMPANY** to whom we make a shipment. Our stock is **LIMITED** but we still have a goodly quantity to dispose of at prices worth while considering.

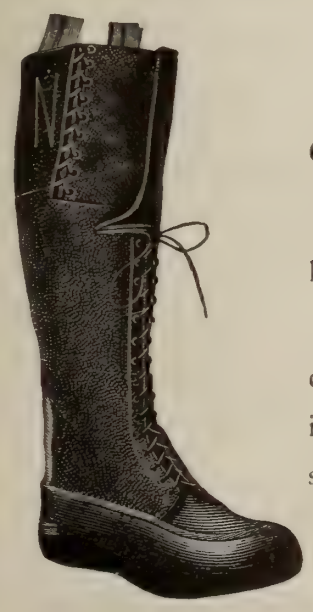
PENETANG SHOEPACKS

Gendron Penetang Shoepack Mfg. Co.

Sole Manufacturers, Penetanguishene, Ontario



TO THE TRADE

Gentlemen :—

We take this opportunity to advise you that shoepacks must necessarily advance in price in the near future, owing to the great advance in hides and leathers of all kinds.

We would ask you to place your order for fall at once, as we anticipate a larger demand than ever, and although we have made preparations for almost double the increase in our output, those of our customers who neglect placing orders, may be disappointed in shipments, besides running the risk of having to pay the advanced prices.

Yours truly,

GENDRON PENETANG SHOEPACK MFG. CO.

FOR QUICK SHIPMENT

We offer the following stock, subject to prior sale—All Dry Stock:

A few cars left of:

5/4 x 6/8/10 No. 1 and 2, Barn

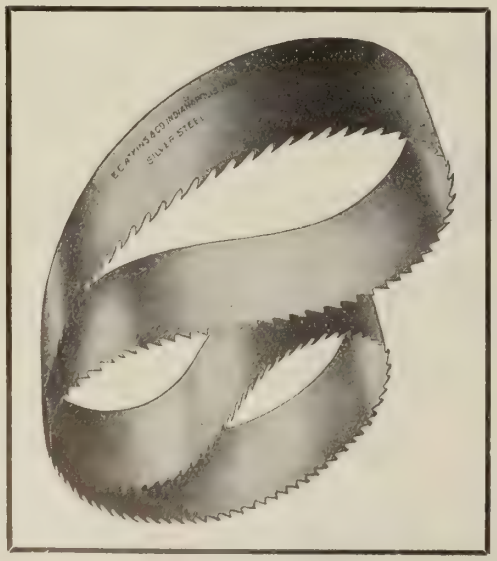
Why not make 1912 the most profitable saw year in your history?

ATKINS STERLING BAND SAWS

Made in Canada



THESE Saws are celebrated on account of their exceedingly tough temper and generally scientific construction. They will stand up to their work longer under the most trying conditions. You will find fewer cracks in ATKINS BAND SAWS than any other and they will hold their teeth and points remarkably. Why not place a trial order and make us prove these statements.

Write to-day

GOODYEAR

Power-Saving Rubber Belting

Goodyear Rubber Belting stands for power saved and money saved. It is built up of plies of rubberized fabric cured and vulcanized into one solid piece. It neither slips nor stretches. It has the cohesiveness of rubber with the enormous tensile strength of close woven, long fibre cotton fabric from which *all stretch has been taken out.*

Goodyear Rubber Belting is manufactured by a process that makes it proof against steam, water, weather and rot. Made in all three grades and all sizes. For Pulp, Paper, Saw Mills—*all* mills where horse power transmitted is large and demand for tensile strength great. Used by biggest lumber mills and manufacturing plants in the Dominion. ***Outlives, outlasts*** all other belts.

Rot-Proof Mill Fire Hose

Goodyear Underwriters is a hose built to meet the specifications of the Associated Factory Mutual Fire Insurance Companies. Tube used of highest grade NEW rubber. ***Won't*** harden or crack with age. Special circular woven fabric with least expansion or elongation under pressure. Antiseptically-treated to make it rot and mildew proof.

The strongest most reliable hose for all mills and factories. Insist on ***Goodyear Underwriters, the hose with the black and yellow stripes.***

Non-Chipping Conveyor Belts

Built for all purposes. For conveying crushed stone, grain, coal, ore, etc.

Made in all thicknesses of face to suit requirements of buyer. Rubber face made of toughest stock possible, to prevent cutting and chipping. Gives longest, most enduring service.

We also manufacture other rubber goods, such as tires, all kinds of hose and belting, rubber packing, etc.

Write us tonight for catalog and prices.

Our Sales of the last four months 50 per cent. greater than those of last year.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 32 Toronto, August 15, 1912 No. 16

Will Regulate St. John River

A system of storage dams and other devices for the regulation of the flow of the St. John River is the principal recommendation by a Board of Consulting Engineers to the International Commission appointed some months ago to investigate the question and to devise a scheme to remedy the conditions which now obtain. The works in question will cost about a million and three-quarters, and would be borne jointly by Canada and the United States. The report recommending them has been completed by the consulting engineers.

The commission consists of M. G. Teed, K.C., and John Keefe, of St. John, representing the Canadian side, and Hon. G. A. Murchie, of Calais, and Hon. P. C. Keegan, of Vanburen, Maine, representing the United States. Mr. S. Jefferson Chapleau, of Ottawa, is the consulting engineer for the Canadian and Mr. P. S. Ferguson, of New York, for the American section. The body was created to enquire into the flow of the St. John River in order that uniformity at different seasons might be established. Beginning at a short distance above Grand Falls, N.B., the river becomes international, and is the boundary between the United States and Canada.

There have been recurrent difficulties in regard to the log drives, and at one time there were open hostilities, culminating in what is known as the Allejash war, when a dam was blown up by Canadian lumber interests and men employed by the Americans crossed the stream armed and threatened to shoot up those of the rival concern. There was little bloodshed, however. It is claimed that the Maine lumbermen are in the habit of holding back all the drives until their own logs are sorted, by which time the water is low and logs of Canadians are left high and dry on the bank. It was a dispute of this kind that precipitated the trouble some years ago.

On behalf of the commission a large staff of engineers under Messrs. Chapleau and Ferguson have carefully investigated the whole question, and prepared plans for an elaborate system of storage dams to regulate the flow so as to secure uniformity at all seasons. There is little doubt that these recommendations will be carried out by the two countries.

Another subject being looked into by the commission, and involving points of international law, is the construction of the Telos Canal in Maine in 1840. It is claimed that the effect of this work is to divert to the Penobscot River of Maine the flow of a chain of lakes in an area of 270 square miles which, previous to the canal being built, formed the watershed of the St. John River.

The enquiry into this aspect of the case has not yet been concluded, but it opens up a decidedly interesting international question. The costly remedial works now suggested will ensure a sufficient flow of this river at all seasons, but much of this outlay would have been obviated had the course of the watershed not been diverted.

Astonished at Our Forest Fires

Ever since the first white men settled on the American continent, and probably for many generations previous, forest fires have been taking their toll of the timber wealth of this country and we have heard so much about them that the average citizen has become in a manner callous to the appalling losses involved. Those who are in charge of the forest wealth of the country are fortunately awake to the situation and are doing much to prevent the losses which are so frequent, but they depend upon the co-operation of the public to an extent which the public themselves are far from realizing. The warnings which emanate from the forestry officials of the country are too often looked upon as routine reports published more for the sake of justifying their employment than for the sake of arousing the public to a sense of their own responsibility. When some foreigner however, comes to Canada and sees the actual condition of affairs which he has formerly known of only from statistics, he is generally so surprised that any opinions which he expresses are peculiarly forcible and bring home to ordinary readers a real sense of the great losses which have occurred, and are likely to occur in the future unless a general awakening takes place and the public backs up those who have devoted their time and their brains to this all-important problem.

Such a warning has lately been expressed by a Swedish expert who has come to Canada as a representative of the Government of Sweden to report upon Canada as a land for Swedes to emigrate to, and also to study the general forestry and economic conditions of Canada. Professor Gunnar Anderson of the Technical University at Stockholm, and Mr. A. Holmgren, of the Forestry staff of Sweden, have recently been in conference with the Forestry staff of the Province of British Columbia and have had the advantage of visiting many of the important timber growing districts in Canada. Mr. Anderson's opinions on the subject of forest protection in Canada are therefore the result of investigations which thoroughly qualify him to speak.

"The people of British Columbia," he says, must awake to the necessity of fully protecting their forest wealth. This is one of the most vital problems your province has to meet. I am glad to see that the government is taking this matter up and is organizing a forest protection service, because the future of British Columbia, to a large extent, is in her forests. We have come to Canada for two purposes. They are to form a general opinion of the natural resources and economic life of Canada, and to obtain some idea of what the position of the Dominion will be in the future lumber production of the world.

"With regard to the first matter we are interested in a personal sense. While we do not desire to see our people in Sweden leave their country, if they are determined to do so, we wish to ascertain which is the best country in the new world in which they may make their homes.

"We have visited the Eastern States and the prairies. We were at Wetaskiwin, 'New Sweden' about three hundred miles south of Edmonton, where we found the Swedish community had done very

well. We have come to the conclusion that our people could not do better than to homestead on your land.

"Now with regard to forestry. In Eastern Canada we found large areas of timber land that had been devastated by fire. We had read of the Canadian forest fires and had seen statistical tables showing the value of the timber destroyed, but we had no adequate conception of the enormity of the loss until we had seen what actually had occurred. Why, we saw in the East, fire-swept areas as large as the whole of Sweden. Not a single tree had reached its natural age. Some areas had been burned off two and three times in the last thirty years.

"You have a marvellous wealth of timber here and a climate which is unsurpassed in the temperate zone for the production of immense trees. Some of those we saw yesterday and to-day are certainly among the largest timber in the world and the people of this province ought to congratulate themselves on being so blessed. At the same time there is a great duty upon them to safeguard this source of material wealth so that it may last for all future generations. This, we understand, your government is doing, and in doing that they should have the very heartiest support and co-operation of the people. We have been struck by the vast amount of timber which has been lost by fire in other parts of this country, and the steps which have been adopted here by the forestry department in the way of forest patrols are such as will protect the timber from destruction in that way. The system of creating a fund by contributions from the owners of timber and the government which I believe has been adopted in this province is the proper one, and as I have told your chief forester, who is a most excellent man for the very important position he holds, is sure to work out with satisfaction. Then there is the matter of reafforestation to be attended to. This is a matter which will take time to work out and will require a great amount of experimenting, but I have no doubt that with the fine staff of forest officials the government has gathered this will be most efficiently done."

Speaking of the system of fire protection which is in vogue in Sweden, Dr. Holmgren said that the country was divided into districts under wardens so far as the crown timber areas were concerned, and watch towers were placed on the hills with telephonic communication with the wardens. The moment a fire was discovered the alarm was raised and the warden gathered a fire-fighting force from among the people around. By law every household was compelled to furnish one of its number for this purpose but there was no difficulty found in securing aid, so thoroughly had the people been educated to the duty of protecting the forests. The private owners of timber areas willingly co-operated with the government in the work.

"You have a splendid system of forest service here in every way," said Prof. Anderson. "With the extension and development which will come as time goes on I am convinced that your great timber areas will yield your province incalculable wealth. You have inaugurated a good work here and every forester will wish you good speed. You have the finest forestry system here that we have seen —outside of Sweden."

It remains for the people of British Columbia to make their forestry system equal to that of Sweden and for the people of the other provinces to emulate British Columbia.

British Columbia's Forest Surveys Being Rapidly Pushed

H. R. MacMillan who was recently appointed to the position of Chief Forester for British Columbia recently visited the Sooke, Goldstream and Cowichan district on Vancouver Island, in order to see how the work of forest protection was progressing there. He was accompanied by Mr. H. K. Robinson, the chief of the surveys branch of the forestry department, Divisional Fire Warden Markland and District Fire Warden Bittancourt. Mr. MacMillan was greatly impressed with the dangerous manner in which the woods along the famous Malahat Drive are being slashed and the brush left. This is being done in the course of running a power transmission line across the main line of the Jordan river distribution to the new cement works at Malahat by the Vancouver Island Power Company. This not only detracts from the beauty of the road but should fire at any time sweep through that timber it would destroy the scenic beauty of the drive for all time so far as anyone now alive is concerned.

Mr. MacMillan was most favorably impressed however, with the organized efforts made to protect the timber of Vancouver Island from fire. The forest branch now has fire parties in the field under the direction of Mr. H. K. Robinson, making reconnaisance surveys and five more will shortly be put at work. It is hoped that within three years the department will be in possession of fairly complete information as to the amount of timber in the province, its kind, quality, stand and accessibility, and as this comes in from time to time the officers of the branch will be better able to plan for the future. The minister of lands has given particular instructions that the surveyors are to report immediately all areas of land now under timber found to be suitable for agricultural or grazizng purposes, and steps will be taken to make these areas available to the settler.

When the survey is complete British Columbia will possess a more thorough knowledge of its wealth than any other Canadian province.

The Baneful Effect of the Scalper

The Canada Lumberman does not like, when times are a little out of joint to worry the trade with articles about the causes for the poor prices which are secured or the difficulty experienced in giving away lumber. To-day however, everything is looking rosy in the lumber business so far as the demand and the prices are concerned and it is excusable to call attention once more to something which comes close home to the lumber trade, which, in fact, makes itself felt at regular periods in every business that has to do with the marketing of lumber. Nearly everyone who has any acquaintance with the lumber business will by this time have guessed what we are driving at and most of the guesses will be right The "scalper" is a man whom we have in mind just now. The scalper first comes into notice when he offers lumber at prices lower than those which regular manufacturers and dealers are receiving. Everyone who knows anything about the business probably knows, when a "scalper" approaches him, that he runs little or no chance of delivering the goods, but every now and then a new sucker is found who believes himself an exception to the general rule. He gives the "scalper" an order and then pats himself on the back for a shrewd business man. In reality he is a fool and soon he will join the others who have found out from bitter experience that they also once were fools.

There seems to be no way of eliminating the "scalper" but it is quite possible to reduce his influence if the lumber press and the lumber associations and all those who have been bitten will persistently oppose the "scalper" on every possible occasion. We have so often expressed our own views on this subject that we don't like to do it again at the present juncture. Just to give our readers an idea of what one of our contemporaries thinks of the subject however, we publish the following discussion of the question from a recent issue of the American Lumberman:

"After receiving an order they (the scalpers) go around among the mills or wholesale offices and try to secure the lumber at prices that will enable them to snatch a scalp in the place of a legitimate profit. This manner of operating has always been a bane to the

lumber trade, because it has the certain effect of depressing prices below a reasonable profit, rendering them unstable and destroying the confidence of buyers in the market.

"This Bedouin way of trying to seize reprisals from defenseless victims is usually the most rife in periods when the established trade is trying to overcome demoralization of prices and lift itself out of a period of depression, perhaps long continued. Hailing some signs of improvement in conditions as an opportunity to effect a betterment of trade, manufacturers and dealers try to restore prices to a uniform basis, and could do so if it were not for the activity of the short-selling scalper, whose only way to get business seems to be by underselling the market. His hope is to sell the lumber at enticing prices, and then find somebody who will fill the order. Generally this somebody can be rounded up; for there are always operators who are hard pressed for money, not well informed as to market conditions and prone to do almost anything to brace up their bank accounts, even at a loss of profit on their lumber. Such a commission man as here indicated represents a class that prevents the restoration of prices to a basis of reasonable profit at times when conditions of demand and supply are ripe for that result.

"The disposition to undersell when the market is in shape for the advance of prices is not confined to the commission trade. When there has been depression, and the time and circumstances have come that give opportunity to advance prices, there are mill operators who watch for an opportunity to undersell the mill concerns that are trying to put prices on a better basis and hold them there. In the North Pacific Coast country buyers of lumber are well aware that advances of prices for fir and shingles have recently been made, because such advances were needed to save further loss and to overcome the demoralization that had pertained to the North Coast lumber industry since the panic of 1907. The advances made were moderate ones, and left prices considerably below those prevailing two years ago. A large number of the manufacturers were able to get the advanced prices for their stock at lower figures. It can be seen that the mill concerns that were earnestly at work trying to restore the market to a healthy basis were being knifed.

Important Developments in New Brunswick

The reports which have recently come from Fredericton, N.B., that the two power companies at Grand Falls, New Brunswick, will amalgamate and that extensive pulp and paper mills are to be erected at Grand Falls which will utilize the power developed there are of great interest to the people of New Brunswick and mean a most important development in the industrial activities of the Province. The plans of the new company are pretty well known as they are practically the same as those which were mapped out by Sir William Van Horne some four or five years ago, for the realization of which the people of New Brunswick have been anxiously hoping.

At Grand Falls large pulp and paper mills are to be erected and the great water power there is to be harnessed and eventually be utilized for other purposes as well as the running of the plant which the company will erect at Grand Falls. The investment, which has been arranged for and which will be made, will amount to at least $6,000,000, although it may reach $8,000,000, the figures given by Sir William Van Horne in an interview here when his plans were first outlined.

The financing of such a large proposition is a big undertaking, but it is understood that the capital has been supplied in England and that a market has been arranged there for the product of the company's paper plant. The establishment of such a large plant at Grand Falls means the employment of a great number of men there. Altogether the definite decision to go ahead with the proposal is of the utmost importance to the whole province, and probably means a rapid growth in the population of Grand Falls.

Another important recent development is the re-opening of the saw mills at Marysville, N.B., by the Partington Pulp and Paper Company which recently purchased the Gibson mills and limits. The mills had been closed down all season. They will only cut about five million feet this year. It is expected that the company will erect a pulp mill at Marysville.

These two developments on the St. John River are matters upon which the people of New Brunswick are to be congratulated as it is believed that they indicate a general improvement in business conditions.

Successful Forestry Meeting Assured at Victoria, B. C.

The forestry meeting which is to be held at Victoria, B.C., Sept. 4, 5 and 6, is the fourteenth annual convention of the Canadian Forestry Association, which comes to British Columbia upon the invitation of the Government of that province. This is the first time tince 1906 that the Canadian Forestry Association has met further west than Regina, its gatherings having been held in the interval in the big lumber centres such as Toronto, Ottawa, Montreal, Quebec and Fredericton.

One of the chief subjects of discussion will be furnished by the new forest law which has just been enacted by the Government of British Columbia, and the organization and scope of the B. C. Forest Service now being established. The relation of this law and this service to the lumbermen in the mountains and on the coast, and to the railways will be set forth, and some points, no doubt, keenly debated. The Government is taking a keen interest in this convention owing to the immense importance of the forests of British Columbia and the large revenue which they bring in to the province. Sir Richard McBride, the Premier, and Hon. W. R. Ross, the Minister of Lands, will address the convention upon the law as it affects their departments. The lumbermen and the railways will be well represented by those qualified to speak from their respective positions. Quite a large number of prominent men in forest administration and lumbering are expected to attend from Eastern Canada, as well as from points nearer the Pacific Coast, and a number are also expected from the United States. Among those who have already intimated their intention of attending are Hon. Jules Allard, Minister of Lands and Forests, Quebec; Dr. B. E. Fernow, Dean of the Forest School of Toronto University; Mr. R. H. Campbell, Dominion Director of Forestry; G. C. Piche, Chief Forester of Quebec, etc.

It is proposed to begin with a reception on the evening of Sept. 4, followed by regular sessions in the mornings and afternoons of Sept. 5 and 6, concluding with a banquet on the evening of Sept. 6. Delegates from the United States will be cordially welcomed and given full opportunity to participate in the discussions. The railways have granted single fare round trip rates.

In their official notice calling the convention the Association say:

"In 1910 the value of the forest products of Canada was $166,000,000 or over $22 for every inhabitant. Every one can see how this touches him. If we go on as in the past, slashing and burning our forests, this immense industry will be lost in a few years, and with it will go all its subsidiary industries. Great as this loss will be it will be exceeded by the loss of our agriculture, waterpowers and navigation.

"On the other hand the amount of land in Canada suited only to trees is such that if the forests are maintained in these areas and properly worked the resulting product will not only keep every existing wood-working industry going for ever, but these industries can be greatly increased without using more than the annual growth. At the same time our agriculture, navigation and waterpowers will be enabled to reach their highest development."

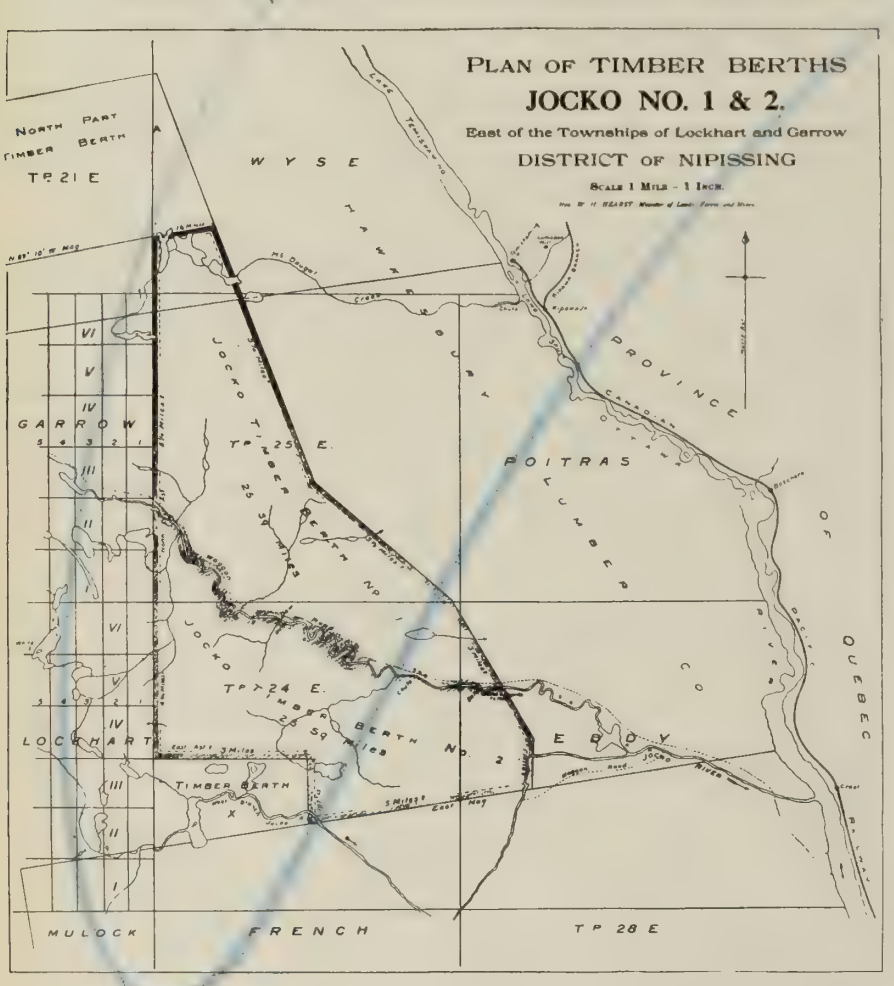
Ontario Limits to be Sold by Tender

Offers to be Submitted by October 1st—White Pine, Red Pine and Spruce to be disposed of Subject to Manufacturing Conditions

The Ontario Government are calling for tenders for the right to cut white and red pine and spruce on two berths on the upper waters of the Jocko River. These berths are situated east of the townships of Garrow and Lockhart in the district of Nipissing and are known as "Jocko No. 1" and "Jocko No. 2." Each contains about 25 square miles.

Tenderers are required to state the amount per thousand feet board measure which they are prepared to pay for white and red pine and spruce respectively, in addition to the Crown dues of $2 per thousand feet board measure for white and red pine and $1 for spruce. In the event of square timber being made, dues are to be paid at the rate of fifty dollars per thousand feet cubic in addition to the bonus. The license to cut this timber will extend to the 30th day of April, 1918.

The timber will be sold subject to the condition that it is to be manufactured in the Dominion of Canada. An annual ground rent of $5 per square mile will be charged. Berths are to be tendered for separately, and with each tender a marked cheque for $25,000 will have to be enclosed. The timber is to be cut in an economical manner



and in accordance with the directions of the Department of Lands, Forests and Mines. The timber cut by the purchaser will be measured on the ground by cullers appointed by the Minister of Lands, Forests and Mines, and half the wages and expenses of such cullers will have to be paid by the licensee. The rights of holders of mining claims or locations, or lands purchased for other purposes, if any, will be reserved. The sale will be subject to the Crown timber regulations.

These berths are in the neighborhood of the Hawkesbury Lumber Company's timber berths and are convenient to Ottawa Valley operators.

In view of the above sale, it is of interest to note some of the prices paid for similar limits during the last few years. One sale of virgin timber on an island in the Georgian Bay in September, 1907, brought $12.55 per 1,000 ft. board measure for pine. The dues on this timber were $2 per 1,000 ft. board measure.

A quantity of fire-damaged timber sold in September, 1909, at $11.27 per 1,000 ft. for pine and $8.55 for spruce. The dues on this were $2 per M. ft. These berths were on the Mississaga forest reserve.

Other recent sales have been made at $10.55 for pine and $8.55 for spruce with dues of $2 per M. ft.

Sales of fire-damaged timber have also taken place of late at $6 and $9, depending on the location, quality and quantity of the timber stand.

In December, 1905, fire-damaged timber in Dana Township was sold at $8.25 per M. with dues of $1.25 per M. ft.

Berth No. 22, Algoma, was sold in March, 1907, at $10.52 per M. ft. and dues of $2.

Timber Resources of the Hudson Bay Region

Interesting observations with regard to the timber of the Hudson Bay region (the southern part of the old district of Keewatin), are found in the 1911 report of the Director of Forestry, published as part of the Annual Report of the Department of the Interior for 1911. Mr. J. T. G. White, an experienced timber cruiser and fire ranger (who has since been drowned), reports on the conditions of the forest around Split Lake, on an area of about 2400 square miles. This whole territory was originally covered with forest. The islands in Split Lake still bear spruce, tamarack and jack pine large enough for railway ties, poles and lumber. All the rest of the country has been burned over at lease once within the past forty or fifty years, and the timber, which dates from the last fire, rarely exceeds three or four inches in diameter. The shores of Split Lake have been burned over, on an average once every season. Fortunately, in this district the soil is usually deep, and can always support another crop of trees. The presence of merchantable forest in protected situations proves that the young forest now started will become sufficiently valuable to support sawmill and pulp industries and supply a large population if it can be protected from fire. Very little of the land traversed by Mr. Whyte is suitable for agriculture. Mr. J. T. Blackford, fire ranger at Oxford House, reports similar conditions on about 5400 square miles of territory in that region.

Ontario Crown Lands Annual Report

Revenue from Woods and Forests Increased by $315,393 —Lands, Forests and Mines Receipts over $2,700,000

The report of the Minister of Lands, Forests and Mines of the Province of Ontario for the year ending October 31st, 1911, which has just been published, contains much useful and interesting information for lumbermen.

The total collections of the department from all sources for the year amounted to $2,710,242.68. The total expenditure for the same period amounted to $672,655.48.

Referring to the timber resources of the province the report says: "The terrible forest fires that occurred in the Porcupine and Cochrane districts during the past year are still fresh in the public mind. The timber damaged consisted of Jack pine and spruce, there being no red or white pine of any moment in that locality.

"The revenue accrual under the head of woods and forests for the year ending the 31st of October last was $2,151,258.14, which is $315,393.82 in excess of the revenue accrual for the previous year.

"The increased accrual is caused by the coming in force this year of the regulation increasing the timber dues on old limits. The dues on sawlogs have been advanced by 50c. per thousand feet board measure, and on square timber by $25 per thousand feet cubic. The ground rent was increased last year from $3 to $5, and the transfer bonus was also increased from $3 to $5 per mile.

"The revenue accrual under the head of woods and forests for the $123,543.84 less than that of the previous year. The decrase in revenue was caused by lumbermen failing to pay in before the 31st of October, the end of our fiscal year, a number of them finding it impossible to pay at that date.

"The cut of pine sawlogs and boom timber was 29,000,000 feet board measure less than that of last year. There was also a small decrease in the quantity of other kinds of timber cut. The cut of pulpwood was 9,000 cords less than that of 1910. There was an increase of 467,171 railway ties over the previous year.

"There were no timber sales of any consequence held during the year. A few areas which had been injured by fire were offered for sale by tender so as to obtain the value of the timber for the public.

"The revenue of $1,711,436.87 above mentioned, was made up as follows: bonus, $426,718.71; timber dues, $1,173,283.85; ground rent, $104,325.96; transfer fees, $7,110.35; total, $1,711,438.87.

Statement of Timber and Amounts accrued from Timber Dues, Ground Rent and Bonus during the year ending 31st October, 1911.

"The expenditure for the up-keep of Algonquin and Rondeau Parks was $18,044.89 and $2,640.36 respectively. The amounts of the collections were: Western collections, $1,596,520.65; Belleville collections, $19,461.67; Ottawa collections, $95,456.55; total, $1,711,438.87.

The accompanying table shows the timber and amounts accrued from timber dues, ground rent and bonus during the year ending October 31st, 1911.

A New Wood Distillation Company for Ontario

The Dominion Wood & Lumber Company which was recently incorporated under an Ontario charter with a capital of $250,000, has commenced work upon the construction of its plant. The purpose of the company is to carry on a wood distillation business and manufacture the various other products connected with such an industry. Among other products will be wood alcohol, charcoal, acetate lime, etc. The head office is at 123 Bay street, Toronto. The factory will be located at Trout Creek, Ont. The officers of the company are: Jacob Kaufman, Berlin, President; A. E. Clarke, Toronto, Vice-President; Thomas Hodgson, Orillia, Manager and chemical engineer; Gilbert Trussler, Trout Creek, Ont., Sec.-Treas. The balance of the Board of Directors is made up of: W. S. Kelley, Bridgenorth, Ont.; W. J. Foster, Toronto, and Edward Clark, Toronto.

The company have contracted with the Ballantyne Lumber Co., Toronto and Trussler Bros., Ltd., Trout Creek, for a supply of cord wood for the next 20 years, to be delivered at the plant. The two companies who are to furnish the cordwood have constructed 10 miles of track during the past season and have purchased rolling stock so as to be able to furnish the cordwood with the lowest possible expense. The factory will be constructed entirely of concrete so as to insure it against loss by fire. It is expected that manufacturing operations will be commenced about the first of September. The company already have a supply of dry hardwood upon which to commence operations.

Northern Ontario Timber Resources

"Haileybury as a lumbering centre," is the title of a prophetically conceived article recently published in the Haileyburian, of Haileybury, Ont. The claims made in the article may be considered a trifle too optimistic by some lumbermen in other parts of Ontario, yet they are interestingly suggestive of a great future for Haileybury and are in refreshing contrast to the pessimistic reports one hears so frequently regarding the approaching exhaustion of our timber resources. The article referred to is as follows:

The fact that upwards of $350,000 is distributed from Haileybury offices of some of the largest lumbering concerns in Ontario every year surely entitles Haileybury to the title of a lumbering centre. Yet this is a feature which is overlooked by quite a number of people who live in the town. Haileybury will before long be one of the greatest lumber centres in Eastern Canada, for several reasons. A question which is sometimes asked is "How is it that some of the big lumber people such as J. R. Booth or the E. B. Eddy people do not build a mill here?" And at first glance it does seem surprising that these lumber barons continue year after year to have their logs towed past Haileybury down the lake, and driven along the River Ottawa to the Capital of the Dominion to their sawmills and pulp-mills, when they could save all that cost by manufacturing them right here. The reason of this apparent waste is that these big lumber interests already have their hundreds of thousands of dollars invested in mills below, and the bulk of the logs they cut do not come from as far north as Haileybury, but are furnished by the timber limits owned on the lower tributaries of the Ottawa. The logs and cordwood from this district are simply used to augment the main present supply, and as long as this is the case there is little probability of those concerns already established who have a sufficient supply in sight below Temiskaming, moving their plants to this district. This, however, is no reason why Haileybury should not equal or even excel the present lumber centres, for there are reasons which can hardly be overcome which will compel some one to saw a vast quantity of lumber somewhere within ten miles of Haileybury, and no concern which thinks of locating in this neighborhood can afford to go elsewhere. The supply of timber which has yet to be cut and floated either to Haileybury or past the town, consisting of pine, spruce, cedar and tamarack, is inconceivable. The quantity known to exist almost defies figures to express, and the amount of country which has not yet been explored, but which is covered with timber, is immense. Another feature which must not be forgotten is the fact that to-day there are millions of trees which were not regarded as worth cutting when the fringe of the district was cut over, which would be considered as marketable to-day, for as the big pine trees are becoming scarcer, the smaller stuff is becoming more valuable, and it will not be long before big mills are running almost entirely on timber which used to be considered as scrub. Added to this it must be remembered that every year that live timber is standing is adding to the size of the trees, and therefore by the time that any fair-sized limit is cut over it will be possible to go over it again.

Still another reason why mills must be established here on a large scale, is the fact that there is an immense quantity of timber of the heavier classes which will not float long enough to enable it to be sent far from the place at which it is cut. In this class is balsam, of which there is an incredible amount. This and other heavy woods could be driven as far as Haileybury, and sawn or made into pulp, and there is no doubt that there are men in the business who will grasp the opportunities which present themselves in this direction. It is rather significant that such great firms as the J. R. Booth, the E. B. Eddy Co., and other lumber interests have their agents lo-

cated here, while the firm of Gillies Bros. are closely in touch with the situation in Haileybury.

It is also worthy of note that the earliest industry in Haileybury was a sawmill. One of the factors which has hindered the development of the lumber industry up to the present has been the distance that the T. & N. O. Railway line was from the water, making it necessary to team the sawn lumber from the mill to the railway, but this difficulty is nearly removed to-day, and will be completely removed by the fall of this year, as the Haileybury spur, now under construction, connects directly with the waterfront. While it is not possible for any one to pose as a mind reader and say what Mr. C. A. Foster will do, it is only reasonable to expect that as Mr. Foster has labored night and day to get the spur built, and has said that he would have the mill running when the spur was built, it will not be long before the Haileybury sawmill will be running and turning out its full capacity of lumber. It is a well-known fact that more than one big outside concern has contemplated buying the mill when railway facilities were available. It will thus be seen that there are great openings for sawmills, pulpmills, planing mills, and woodenware manufacturers, so that lumbering may be relied upon as one of the great features of Haileybury's future.

A Record Raft of White Pine Logs

The accompanying illustration gives a fair idea of the size of a record raft of white pine logs which was recently towed across Georgian Bay and Lake Huron for the Cleveland-Sarnia Saw Mills

Ninety Thousand Pieces in One Raft for Cleveland-Sarnia Company

Company and safely delivered at their mill at Sarnia. The company has been receiving a number of exceptionally large rafts this year and the one shown in the illustration is said to be the largest which has been towed over the lakes in the last ten years. The raft was successfully landed in the company's booming grounds at Sarnia on August 5th after a journey of 260 miles from the mouth of the Spanish River. The raft was towed in patent booms made of 12 x 12 in. and 12 x 14 in. timber and in a bag shape. The logs were all loose inside of these booms, but in towing they pile up one on top of the other, so that sometimes they are 6 to 10 ft. deep in coming over the lake. As the logs are cork pine, the under logs are inclined to come to the top of the water, hence they hang together. They were brought down by three tugs: the "James Reid," "Sarnia City" and "J. M. Diver," and were ten days on the trip.

An idea of the size of the raft may be obtained from the fact that it contained 90,000 pieces, and the booms which encircled it were 1¼ miles in length.

Railway Regulation to Prevent Forest Fires

Order 16570 of the Dominion Board of Railway Commissioners, covers the method of equipping locomotives so as to prevent them from being a cause of forest fires, and at the same time lays down the liabilities and requirements of railway companies in the event of such a conflagration occurring. The order cancels earlier orders 3245, 3465, 8902 and 15,995, bearing on the same subject.

Every locomotive must be so equipped with smokebox netting as to prevent the discharge of live cinders. When equipped with an extension smoke box, the whole space through which the smoke ascends must be covered with a mesh not larger than 2½ by 2½, No. 10 b.w.g., the openings in this screen not to exceed 17/64 in. square. Diamond stacks are to have 3 by 3, No. 10 b.w.g., screen at the flare of the stack, the mesh openings not to exceed 13/64 in. square.

The ash pans are to have sheet iron dampers where practicable, and where it is not, 2½ by 2½, No. 10 b.w.g., netting, such dampers to be secured by heavy springs or a split collar. Overflow pipes from the injector or boiler are to connect into the front and rear of the ashpans in order that they may be properly wetted, and are to be used yearly from April 1 to Nov. 1, unless otherwise directed.

Inspectors must be provided by the companies at divisional and terminal points to examine, at least once a week, the netting, dead plates, ashpans, slides and all other fire protecting appliances, and to keep a record of every inspection, recording the locomotive number, time, condition of apparatus, and record of the repairs necessitated, this book to be open for inspection by the board. No locomotive must be permitted to operate on the discovery of any defects, until repaired. The railway must also appoint special inspectors to make an independent examination monthly, and to report the results of the inspection to the chief official responsible for the operation of the motive power. An authorized official of the board is to be free at any time to make an examination of the locomotive equipment.

No Lignite as Fuel

Employees are to exercise extreme care in not injuring the fire-protecting appliances, and to see that the back dampers are not open when running tender first. The depositing of fire or live ashes upon the tracks or right of way outside the yard limits unless immediately extinguished, is forbidden. Lignite is not to be permitted as a fuel on locomotives unless otherwise ordered by the board.

The railways are ordered to establish and maintain such fire guards along the line as the chief fire inspector may prescribe, the latter submitting to each railway annually a statement of the measures deemed necessary to maintain the line safe from fire. These measures may provide for the cutting and disposal by fire of all the debris and undergrowth, and the ploughing up of strips on one or both sides of the line as local conditions require, the intention being to adjust conditions to the degree of making the expense proportionate to the fire risk and the possible damage.

In carrying out the provisions of the Railway Act concerning the removal of dead grass, etc., from the right of way, the railways are forbidden to burn any ties, cuttings, debris or litter on or near the right of way between April 1 and Nov. 1, except under such supervision as will prevent the spreading of the fire beyond the strip. The chief fire inspector or authorized member of the board may require all such burning to be carried out under a written order.

The railway shall provide and maintain a sufficient force of rangers from April 1 to Nov. 1 each year for an efficient patrol, the methods of the rangers being subject to the approval of the chief fire ranger. The annual statement of the chief fire ranger to the railway shall provide for the number of men with their stations and duties, the acquisition and location of the necessary equipment for the transportation of the tools and force from point to point, and any other measures that are considered to be essential by him.

Railways that use oil as a fuel exclusively on all or any portion of the system shall be relieved of such part of these requirements as may seem to the Board safe and expedient.

Railway's Liability

All employees shall be ever alert to report the existence and location of a fire, train employees reporting to the agent at the nearest telegraph station and to the first section employees passed, it then being the duty of the person advised to notify the nearest fire rangers. Any fire presumably started by a railway shall be attended to either independently or under direction by the section hands or other employees that are available, provided those employees are not at the time engaged in labors immediately necessary to the safety of trains. When the men available are not sufficient, the railway shall employ such other men as are considered necessary, and when the extra men thus obtained are sufficiently numerous, the regular employees may be returned to their usual occupations. In this connection, any fire starting within 300 feet of the track shall be presumed to have started from the railway, unless proof to the contrary is furnished.

For the violation of any of these regulations, the railway shall be liable to a penalty of $100 for each offence in addition to any other liability incurred. Any employee or party included in the regulations, and who fails to obey them, is subject to a penalty of $25 for each offence, in addition to his other liabilities.

The Canada Year Book, 1911, which has been published by the census and statistics office, Ottawa, contains, as usual, a mass of useful information. The very wide scope of its contents makes it a welcome book of reference to the busy man who requires carefully prepared trade and commercial reports at his hand.

Canadian Forestry Association Convention

Arrangements have been practically completed for the fourteenth annual convention of the Canadian Forestry Association which is to be held in Victoria, B.C., on September 4th, 5th and 6th. A number of excellent addresses and papers have been arranged for and a series of resolutions of the utmost importance will be presented for discussion. Sir Richard McBride, Premier of the Province of British Columbia, and Hon. W. R. Ross, Minister of Lands, are taking a personal interest in the convention, and will address the delegates upon the subject of Forestry which is now uppermost in British Columbia. While papers and addresses will naturally deal with matters that concern British Columbia, they will not be confined to this, and in every way the convention will be national in character and embrace every part of Canada.

The program will include addresses of the most practical character by leaders in forestry and lumbering in Canada and the United States. It is proposed to open with a reception to delegates on the evening of Sept. 4, followed by regular sessions on Sept. 5 and 6, at 10 a.m. and 2.30 p.m. The regular sessions will be held in the hall of the Alexandra Club, which is centrally located and in every way fitted for such a gathering. On the afternoon of Sept. 6, it is expected there will be an outdoor entertainment in which the ladies may participate. The details will be announced in the program issued at Victoria.

It is planned to conclude the convention with a banquet on Friday evening, September 6.

Arrangements have been made with the railways which enable the Association to promise a rate of a single fare for the round trip to all attending the Convention from all points in Canada. This rate is, of course, open to ladies attending the Convention.

Full particulars degarding the convention and the railroad arrangements may be secured from the Secretary, James Lawler, whose present address is Victoria, B.C.

Substantial Trade Conditions in British Columbia

This is the season of the year when the business community assumes more or less of a waiting attitude and with it comes a corresponding decline in bank clearings, says a Vancouver report. But the trend of business is so certain of increased activity that the hesitating tone has entirely disappeared as a factor. Most pronounced as a contribution in this direction is the prosperous condition of the lumber trade. Both interior and coast mills are filled ahead with orders, and local trade is beginning to complain of delays in delivery. The real cause is the withdrawal of United States competition on the prairies due to the increased building in the States, thus leaving the Canadian field to the Canadian manufacturer. The second and equally important consideration is the prairie country's faith in a large crop, which from reports received here is well founded. Advantage of the demand has already manifested itself in a small increase in prices with the mills considering another advance should the orders continue to flow in at the present rate.

Another contributing factor in presaging an increase of activity is the letting of new contracts for railroad and other development. Hardly a week goes by without the announcement of some large contract let. Recently it was the bridge work on the Canadian Northern, and now all the firms are engaged in filling bids for the Alberni branch of the Canadian Northern on Vancouver Island, the contract for which is about to be awarded. Together with all the work now in progress, all more or less beneficial to the business of Vancouver, there is little wonder that optimism is the prevailing note. Building during July took a spurt, and the trade is looking for still greater activity. This branch of industry has sagged for the first half of the year. The idea was very pronounced in mortgage circles that the city was in danger of being overbuilt, and consequently the brakes on loans were put up, with a material decrease in building. This opinion is fast dissipating, and while building permits are not expected to equal those of last year, the total will make a very respectable showing.

Lumber Prices Stiffening in Alberta

There is more than ordinary activity in all branches of the lumber industry throughout central Alberta. Eighty-nine cities and towns in the district, reporting to the Edmonton Board of Trade, say that in many instances there are long delays in the delivery of all kinds of building materials. Mills in the interior are rushed and there is a congestion of traffic in most of the yards along the line of the Canadian Pacific Railway. The Grand Trunk Pacific and the Canadian Northern roads have day and night crews to handle their business in the yards. The reason assigned for the unusual activity at this time, is the withdrawal of some United States firms from the prairie provinces because of increased building in the United States. An additional reason is the fact that the grain crop now being harvested in the province of Alberta, Saskatchewan and Manitoba, will, it is believed, be the largest in the history of the Canadian West. Prices of lumber are stiffening and it is probable that advances will follow in the event that orders continue at the present rate.

Washington Pine Men Fear High Freight Rates

A despatch from Spokane, Wash., says: Except on the matter of railroad rates the entire tone of the half yearly meeting of the Western Pine Manufacturers' Association recently held was permeated by a buoyant and hopeful spirit. The general feeling given expression to was that the lumber business, after a long period of depression, was on the upward way. At the morning session a railroad committee consisting of T. J. Humbird, C. P. Lindsley and A. W. Laird was appointed to look thoroughly into the railroad rate question, which it was reported was likely to be settled both with the Canadian railways and in interstate commerce, adversely to the interests of the western lumber trade. The proposal of the companies, it was reported, would be to automatically raise the rate by a change in classification, pine under the new arrangements being classed with cedar instead of with general lumber. This would raise the rate of western pine to Winnipeg from 37 to 47 cents and effectually shut the door of Canadian trade to the products of local mills.

It was also stated that a new tariff has been filed at Washington, D.C., the effect of which will be to raise the lumber rates throughout the country. The committee will make every inquiry into these matters and take whatever steps are necessary with the interstate authorities.

It was reported that owing to the carpenters of San Francisco refusing to work with any lumber not finished in local mills, operated with union labor, Oregon and Washington dressed lumber was practically boycotted on the San Francisco market. A strong resolution, drawn up by G. M. Cornwall, was unanimously passed, protesting against the boycott.

Important Timber Deal in Alberta

Fifteen thousand acres of timber land at the mouth of the Macleod river, owned by residents of Edmonton, will become the property of E. A. Mann, H. D. Murphy and James Ludgate, of Orillia, Ont., if the deal, for which negotiations are now in progress, is consumated, as expected. The timber is valued at $100,000. Dr. A. Forin, manager of the holding company, announces that the prospective buyers visited the property recently and are highly satisfied with the stand. The Ontario people were accompanied by experienced cruisers, who made favorable reports. The sale of the timber area means the establishment of a large sawmill, the products of which will be marketed in the prairie provinces.

Freight Congestion at Edmonton

Failure of the Canadian Pacific Railway Company to deliver lumber shipped from mills in British Columbia to Edmonton resulted in a meeting of dealers and contractors in the rooms of the Edmonton Board of Trade, recently, when F. T. Fisher, secretary of the organization, was instructed to lay the matter before General Manager Bury at Winnipeg. The burden of the complaint was that the railway company has not sufficient terminal facilities and yard accommodations to handle the business. Mr. Bury has replied that everything will be done to facilitate delivery and has instructed local officials to assist the dealers and builders in every way. A crew of men is at work clearing the yards.

The Mountain Lumbermen's Association recently made application before the Board of Railway Commissioners for a special rate on lumber shipments from mountain mills to points in Alberta and Saskatchewan. Mr. W. A. Anstie, secretary of the association, presented the case for the lumbermen.

The following list of patents recently granted by the Canadian Patent Office relating to lumbering, is furnished by Featherstonhaugh, & Co., 5 Elgin street, Ottawa, Canada: 141,580, Jos. F. Bouchaid, Farrellton, Que. Sawing machines; 141,609, Wm. Jenkins, Meaford, Ont. Circular saw guards.

A Real Philanthropist

A northern lumber dealer contracted to supply a lot of lumber to a stranger. In looking over it, he found it full of knot-holes, and told his customer about this frankly. "You may not want this lumber," he said, and the stranger asked "Why not?" "I have to be honest with you," said the dealer—"It is full of knot-holes"—and the stranger only laughed. "I will take it," he declared. "This lumber is to go around some base-ball grounds. Knot-holes won't hurt matters any. I was a kid once myself."

The Retail Dealer and His Problems

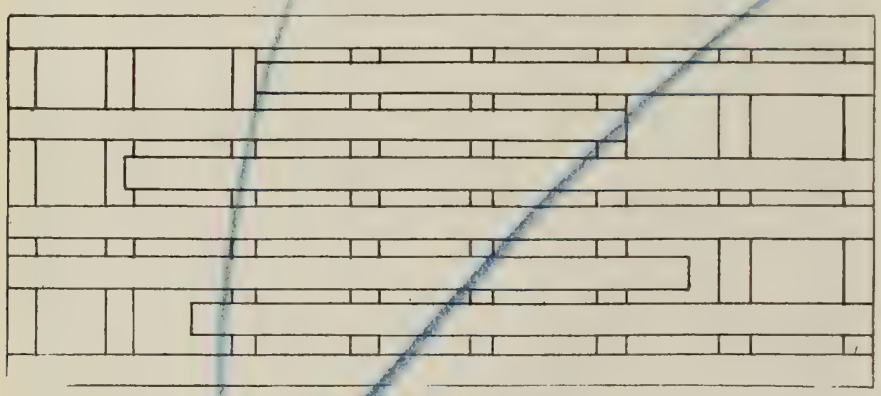
Suggestions for Piling Mixed Lengths—Short Length Troubles

Piling Mixed Lengths

Anyone in the lumber business will readily admit the importance of proper piling, and yet it is not an uncommon sight to see, in the yards of some up-to-date millmen, lumber piles with rear ends that are irregular and awry. There is more of this ragged piling of mixed lengths in hardwood than in pine, for the reason that pine dealers usually trim all their stock to two-foot lengths, so that there is not so much variety involved in sorting for length to make even piling. Among hardwood mills, however, more care is exercised in sorting, to have the longer length stock piled evenly.

In piling the shorter lengths, different sizes are often put in the same pile, which causes some boards to project a foot or more. This not only gives the pile a bad appearance, but exposes the ends to the weather, and they become season-cracked, warped and twisted and will droop in drying until the boards are badly damaged beyond the inside piling strips.

It does not seem to occur to many manufacturers that it is practical to pile short lengths without making the back end of the pile uneven. Sometimes an effort at orderliness is attempted by piling the longer stock at the bottom and loading the shorter pieces on it. This may be some improvement over indiscriminate mixing, provided it is carefully carried out, and there are cross sticks and foundation sills enough to support the piles, so that the short lengths on the top



Suggested Method of Piling.

will not cause the longer lengths underneath to sag between the supports.

It should be practical to pile short lengths, and even mix them in the pile, and keep both ends of the pile straight. It is simply a matter of care in building a pile foundation and using the crossers in placing the lumber. The best plan is to make the back a face end as well as the front and take the same care in making it even. The foundation should be large enough to carry the longest lengths in this mixed stock, and enough supports should be provided for one under every tier of piling strips. The best foundation would be concrete piers and substantial hardwood timbers for supports. Concrete foundations are practical and economical.

It cost a little more to build foundations for this kind of work, and takes a little more time to do the piling, but after looking at a few ragged piles, it will not be hard to convince one that the saving in lumber will more than offset the difference in cost.

Hardwood Yard Machinery

Neither the hardwood manufacturer nor the hardwood yard man will be likely ever to use wood-working machinery as extensively as the manufacturer or dealer in pine. There is not the need for it. Most hardwood lumber is better sold rough, for the reason that it gives the consuming manufacturer the benefit of the freshness of the face wood for finishing, and often this amounts to more than the additional cost of freight involved in shipping rough lumber as compared to dressed stock.

The hardwood yard man, however, often finds it advantageous to use machines, but the usual equipment is not extensive. It may include a trimmer, a rip-saw or side edger, or both, a double surfacer and a resaw with beveled siding attachment. Of course, if one makes a feature of dimension stock, it necessitates additional machinery. That, however, properly is an industry in itself, the subject herein presented being machinery that may be used to advantage in the hardwood assorting yard.

Sometimes one machine, the trimmer, will suffice. It is much better to cut off the bad ends of stock by passing it over the trimmer before shipping, than to mark the size and leave the trimming to the buyer. It makes the stock look better, and there is a saving in freight that will often reimburse one for the expense of using the trimmer.

It is practical also to employ the trimmer to raise lumber to a higher grade by trimming, especially if the lowering defects are near one end. This method of raising the grade should make the trimmer pay a profit, where there is enough work of the kind to justify its use. In rehandling untrimmed, small mill product the trimmer is especially commended.

There is some question as to the wisdom of trimming hardwood lumber fresh from the saw—whether it would not be better to season it before trimming. The best time to trim and grade, and know that the work is finished, is when the lumber is shipping dry. This will demonstrate the utility of the machine in a lumber yard.

As a companion piece to the trimmer, the side edger or rip-saw naturally suggests itself. It is not only a great convenience in reducing stock to special dimension to fit some order, but it also may be used as a means of raising its value by ripping off a defect on the edge of a board. Besides, there always is some stock about the yard that should be ripped and cross-cut to make it readily marketable. Some of it becomes spoiled by season checks, or from other causes until it has little market value; still, it may have good material in it that can be worked out in small dimensions, and made to bring a compensating price.

An ideal equipment for hardwood lumber yards would be a trimmer, swing cross-cut saw and a heavy type of rip-saw (a side edger or a table saw with extension tables front and back to support the stock). Such a rig would not be expensive and might be located at a convenient place in the yard, and preferably driven by an electric motor. In the country yards, however, small gasoline engines might be used advantageously.

Where poplar, gum, or cottonwood is being cut, and there is a trade for bevel siding and other structural lumber, the yard machinery equipment may be enlarged to include a planer and resaw. This would enable the yard man to make beveled siding and other material, and would put him in position to turn out box shooks, crating stock, and other material that might be marketed advantageously. It might also be found profitable, in view of the increasing use of hardwood in interior trim and millwork, for a yard to cultivate this trade by installing more elaborate planing mill equipment, and manufactude casing and base and a full line of interior trim.

Regarding this special millwork line, it is quite evident that the hardwood yard man must give more attention to machinery equipment that will enable him to put his lumber in better shape, raise the grade of some of it here and there, and make a better use of his product and get more money for it than obtainable through shipping it out straight, rough, or in whatever condition it happens to be. The age of discrimination in hardwood has been reached, and to discriminate properly in putting up lumber calls for the use of more or less yard machinery. The exact amount and kind of machinery depends materially, of course, on the location and the trade the yard man is catering to.

Selling Log-Run Stock

A prominent hardwood manufacturer advises his selling representatives that "selling log-run stock is a good deal like selling a man a house without plans or specifications, and that the term at its best is as indefinite as the word hat, as one may be worth fifty cents and another ten dollars." He advises his representatives that on future log-run lumber orders they can make sales with a guaranty as to the percentage of common and better contained therein. Thus they will not be taking chances of displeasing their trade, which constitutes an unprofitable and unsatisfactory transaction.

It is the belief of this shipper that a definite understanding as to what the log-run stock will show in grade should be made, and the facts should be covered thoroughly. On the present basis of log-run sale and purchase it is a gamble on the part of both seller and buyer. The shipper is in better position to assure his customer what his log-run stock will show in grade, than the buyer is to gamble on what it will show. —Hardwood Record.

How to Meet Competition

On the surface the retail business appears the easiest of any line to conduct, and it is, in a way. It would not be putting it too strongly to say that thousands of dealers have engaged in the retail business without thorough preparation and have succeeded fairly well. Unacquainted at the start with the primal elements of the methods which lead to a high degree of success, they have learned, little by

little, and not only have acquired a reputation in the community in which they live as capable business men, but a competency as well.

It would be unsafe, however, for the young man who has a desire to learn the business to take any of these dealers for a model to pattern by. They should look farther than this and take for models those dealers who have succeeded through an understanding of every detail of their calling. Simple as the retail business may appear to some as a business proposition, any man who stands near the top will admit that there is more to be learned than he ever has learned, or ever expects to learn. He may select a favorable location, but that is not all. He may surround himself with the best yard improvements imaginable, but that will not place him on the topmost rung. He may study the characteristics of woods until he has as nearly mastered the subject as any man can, still that is only a single qualification. He may be an adept at buying, knowing the special features of the various markets, and how to take advantage of prices and grades, yet this is only a step. He may possess large capital, with which those who lack it may think nearly all things can be accomplished, and not be a competent retail lumberman. The beginner may think this a long list of qualifications, but other qualifications might be added, and even then the list would remain incomplete. With a good location, excellent yard improvements, a knowledge of woods, an acquaintance with the markets, plenty of money with which to operate, there would remain for him to learn one prime lesson—how to successfully meet competition.

This is a phase of the subject that has given many dealers no particular concern for the reason that to no marked degree have they been called upon to consider it. They have not been so located that a deep study of the question was required. They may be in a town in which there is a single yard, and with little solicitation business comes to them. They may be in a town of several yards, yet competition may be easy, owing to the neighborly disposition of the dealers. But locate them elsewhere; in a town where every man is for himself; where every dollar's worth of business must be won; where it is diamond cut diamond; where the business is in the hands of men who have been trained in every detail that goes to make business an art; where shrewdness has been whetted against the world until it carries a razor edge—let them go to such a market and a realization of their incompetency would dawn upon them.

Whether in a trade, or a profession, other things being equal, he succeeds best whose knowledge of human nature is greatest. Without this knowledge one is constantly stumbling, and the more people with whom such a one comes in contact the greater the necessity for it. The retail lumberman should not only have a large number of regular customers, but should aim to gain new ones constantly. To treat customers well goes a long way toward meeting competition successfully. To so treat them, the temperament, peculiarities, likes and dislikes of each must be studied and considered. The young man about to engage in the retail business might not give a thought to the fact that a knowledge of human nature would be one of his most valuable assets, but if he studied himself closely, and the methods of the merchants whose names stand for success, he would learn that this knowledge of human nature is the keystone that holds the arch in position. If, with sufficient capital and possessed of the necessary qualifications, he fail to read his customers aright, then complete success will never be his.—The American Lumberman.

Forcing Short Length Stock on Unwilling Buyers

There are some questions in this list that I have elected to discuss in this department that remind me of the old puzzle question, "What would be the result of a meeting of an irresistible body with an immovable body?"

Of course we know now that such a question is altogether hypercritical, but I know we used to think enough of it to have it for one of the subjects of debate at our regular Friday afternoon's exercises at the school I attended. No satisfactory conclusion was ever reached, but it served the purpose of good mental discipline and I presume that was what it was intended for by the teacher.

Now, one of the questions I have taken up for this week is as follows: "How can I work off short lengths in fir flooring, ceiling, drop-siding, when my customers can go to my competitor and get all long lengths, regardless of the fact that I offer a concession of at least $5 a thousand on the short lengths?"

Another question, dealing with short lengths is asked, I presume, by another party: "How am I to keep down my stock of short lengths, when the company has loaded me down with this class of stock from the closed yards?"

A man has got to run a yard a few years in these new prairie towns before he can fairly comprehend and understand the conditions and the reasons for such questions. A city yard man would look upon it as a foolish idea for the customer to be allowed to dictate his will in a matter of this kind. He has his established rules that he knows are in common with those of his competitors, and the trade being acquainted with them as well, are educated up to where it does not ask for such privileges. But in a new town there is but little established other than its physical features. Human nature in its most selfish form endeavors to have a free course, and predominates in all social and business transactions, especially the latter. In so doing, it crops out in a variety of unreasonable and unjust forms and demands which are more or less successful because the fact that every business man in the same line is antagonistic to the others and therefore has no rules of doing except to "do the other fellow and do it first." Of course this state of mind and feeling is greatly to the advantage of a public that is united in its selfishness to get the better of every business man in whatever way possible, and it is a literal fact that "every man is for himself and the devil take the hindmost." It is a hard place for such a thing as conscience, and many a man in business has found it a most convenient thing to have and has put it in storage for awhile till the time comes when he can take it out and give it a chance to work without interfering very much in his business.

Must Accept Existing Conditions

Many a good man, too, has discovered before he has been in such a place very long, that he has got to take things as they are and not as they ought to be. But all the while he should be constantly endeavoring to bring about a better adjustment of those things that make for the greater harmony among the business men of the community.

It is invariably the case that where the retail lumber business in a country town is suffering from a lot of established customs that are unreasonable from either a moral or business standpoint, it will be found that these customs have grown from the unbusinesslike actions of some dealer or dealers who were there many years back when the town was new. Every old carpenter in the place has done what he could in assisting to keep them alive to plague the present dealers. In hardly two towns are the conditions the same in this respect. I know this from the experience I have had in running a yard in seven different places.

In one place I remember I found when I went there that it was hard to sell anything from a "jag" to a bill of lumber unless the privilege was given the purchaser of picking out and taking only what he chose to accept. It certainly was "fierce" the way they come at me. "Why," they said, "that's the way we have been allowed to do by the former manager who was here." Yes, I told them, and that's one of the reasons why he is not here now. You better believe I soon changed all that picking out sort of business for I would have thrown up the job rather than submit to such rank injustice, and when the man at the other yard found that I meant the real thing, he was glad enough to fall into line with my new rule in this respect. From that time on we "bossed" our own yards ourselves.

At other places I have found similar conditions and always found they were the result of a lack of stamina on the part of former dealers too ignorant of business and too weak kneed and afraid to exert themselves in maintaining what was fair and right.

A Matter of Training

The lumber buying public is just what it has been trained to be by the dealers in the place and if the dealers are foolish enough to permit the carpenters to dictate what they want, or the buyers to refuse to take the short lengths as they are shipped, you may be sure that after the present dealers have been succeeded by others, the effects of the old customs will have to be met by the later yard man.

This subject of short lengths was in the limelight a couple of years ago and was pretty thoroughly threshed over in the trade papers and at the association meetings. I've always thought the manufacturers of the coast products were in a way to blame for the cause of the dispute because of the adoption of the method of bundling the short lengths separately instead of packing them with the longer lengths, as do the makers of hardwood flooring. The latter don't make any difference in price, either. A two-foot length costs the

same as one eight or ten feet long, and when the trade understands they can buy it in no other way, they take it of course, and pass it on to their customers, irrespective of whether they like it or not. I have had a few parties who strongly objected to the short lengths and had the "gall" to want me to leave them out just because it was a small amount and wouldn't matter. I really believe if the producers had from the first bundled the shorts with the longs and made no difference in the price of the lengths, which would have made a lower average in price all round, the trade would have become educated to it and in turn have passed it on to the consuming public. As it now is, the very fact of a lower price being charged for the "shorts" has the effect of lowering the value of them in the estimation of not only the trade, but of the customer whom they are trying to sell them to, as well.

Take the average farmer, for instance. He knows very little of the grades and relative values of lumber. You want to sell him some "shorts" or have him take them in his bill, and the argument you use is that it is just as good lumber and as economic to use as the longer lengths. But, the fact that there is a difference of $5 a thousand is conclusive evidence to him that there is something back of your talk that he don't understand about its value. Then, again, the shorts, being in separate bundles, are seen in unfavorable contrast to the longer and being so suggest to the buyer of a bill to propose to take the bill at those figures if nothing but the longer lengths is given him. Naturally this is a strong temptation to the dealer to accept the offer, close the deal, and begin to load up the wagons. The competitor seeing that he has lost the bill, wonders what the turn was that caught the customer and landed the bill. In due time he finds out all about it and there and then nails down a resolve that next time he will go that fellow one better on the short length proposition.

If They Were All the Same Price

This difference in price that the mill men make instead of helping the dealer to sell the shorts, operates, in cases of strong competition, to his positive disadvantage because it affords a dealer so disposed opportunity to use it in making an unfair deal in the selling of a bill that includes the various items having "shorts" in them. Whereas, if they were all in the same bundles with the longer lengths and costing the same there would be small probability that a dealer would go to the trouble of unpacking the bundles and taking the "shorts" out to oblige anybody. But as things are in the sale and shipping of this class of lumber from the coast, dealers have to accept them and should adjust their methods of selling the "shorts" accordingly.

In places where the lust of selling is so strong with some dealers that he is willing to cater to the whims and prejudices of the trade to the extent of sacrificing all profits on his short stock, and even losing money on them, there are several courses to pursue to meet him. One is to make himself the whole of a bill at cost or less which will tempt him to try to work off some "shorts" in spite of his contract, or beat his customer in some other way. Another way is to duplicate his offer so as not to let him have the advertising that the sale of the bills would give him by the former plan. This is something which must not be overlooked or ignored in a new settlement where people are influenced in such matters by what they see and hear others speak of. The question is whether it is not better to lose a few dollars on undesirable stock rather than to suffer a greater loss in the prestige that a yard gets from the sale of bills to the new comers who are governed by appearances, for the sale of a bill means to them that the yard that it was bought at sold it at the lowest figures. It will never do to ignore this common sense fact.

The Shorts Will Accumulate

If such a course is pursued by all the dealers in the town, it naturally follows that all the yards will find at the close of the year they have a lot of this short stuff on hand which cannot be sold for any other purposes than for which it was manufactured. If the practice is kept up, it won't be but a year or two before the constant sight of the increasing piles of this stock will have strong enough influence to make them all amenable to listen to the only proposition that will do away with the folly of such competition, and that is, to unitedly refuse to sell this class of stock on such terms. Of course this is the best plan of all, and it is better still if you have the tact and diplomacy to get the offending competitor to change his methods before the public becomes too well accustomed to it. But in case he is one of the bull-headed kind of men who won't listen to reason and think your coming to him is a sign of your admittance that he has got the "bulge" on you, then you have either got to adopt one or other of the above plans or it is up to you to sell bills and get the purchasers to take as much of the short stock as possible. This can be done in proportion to the wit and knowledge you have to direct you. In other words, it depends on the quality of salesmanship.

The hardest competition I ever had was from a man who could sell anything in the form of lumber and still hold a trade that was satisfied to stick by him. He possessed the faculty of talking to a customer and making him see things as he saw them, or pretended to see. Not all of us have this faculty so well developed as this man had, but we all have it in a greater or less state of development, and if you are confronted with the proposition of selling short shock to unwilling or prejudiced customers, you very much need to study and develop your ability to sell it under such circumstances. The main thing in the selling of short stock is to convince your customers that it can be used to advantage in the work of putting up their building. But with the average man, however, talking is not much good in such a case unless you supplement it by showing them how it can be done.

Let me explain this by going a little into detail, get the plan of their building, or whatever sketch they have of it. Note the placing of the doors and windows on it, and the comparatively small area on the whole building that is covered by the long lengths without cutting. This alone will show them how small a quantity is really needed of the lengths they insist upon having. Measure the distances between the openings and note how many can be covered by the shorter lengths that will cost less than the longer lengths that will require to be cut into the same lengths which they say they don't want because they are afraid of waste or because their carpenter objects to them. I could never see the sense of anyone objecting to take the short lengths of flooring, and when you pin a carpenter down to give a valid reason why he rejects them, he can only give a woman's reason—"because." There is hardly a room in the average house but what in laying its floor you will see that the flooring has had to be cut and so if you take the pains in measuring the rooms of the plan you will find that short lengths of flooring can be used to advantage in such places as the pantry and closets and in the upstairs rooms where the country folks have not yet done away with covering their bedroom floors with carpets. Where the lower best rooms are to be finished in the natural color and grain, the greater part of the surface will be covered by a rug like carpet, leaving exposed a part of it next to the walls. Therefore, short lengths may be used where the rug or carpet will cover them.

Where Shorts Are Not Used

The short lengths of drop-siding are the most difficult to get carpenters to take to use in the building of a barn. The openings are few and long lengths make fewer joints to cut and fit, but there are smaller structures where the shorter lengths may be used as well as not, such as chicken houses, hog houses, privies, and a number of other uses that drop-siding is sold for. I presume that five-eighths ceiling is the thickness that is principally used nowadays, and the ceiling of porches and wainscoting the kitchen is mostly what it is used for. Wainscoting is usually about 2 ft. 8 in. or 2 ft. 6 in., consequently there is a waste in cutting unless you have "shorts" that will make two pieces. There are some porches where some short lengths may be used without loss.

On the whole, if you will take the trouble to go over the plan of the building with the owner and point out what I have indicated, you can convince him that the short lengths can be used as well as not without any detriment to the building or loss to him whatever, and at the same time, save him some money. If, as I have said, you can make him see these things as you see them, you will be able to meet successfully the other fellow's bull-headed competition. I have done it myself and I know the average dealer can do the same if he will "get down to his knitting."

There is one reason why the average country carpenter objects to the short lengths of stock that require a finish joint, and that is because he is unable to make it without taking a good deal more time than a more skillful man can do it in. The cheap men that farmers generally hire to put up their buildings can hardly saw a board squarely in two. They have few tools and what they have they don't know how to keep in order. Consequently the making of a finish joint gives them more trouble than the using of a longer length. If I had a lot of "shorts" unloaded onto me from a closed yard I would seek out the man who had to build, but had but little money and show them how to use the short lengths at a saving of capital. Then again, I would go for the carpenters who had contracts to furnish the material and by offering them special inducements I could get them to take anything that would add to their profits on the contract. In these cases, carpenters are not so particular as when the owner is furnishing the material.—C. H. Ketridge, in the Mississippi Valley Lumberman.

Gordon Grant & Co., Ltd., Port-of-Spain, Trinidad, report under date of July 22nd as follows: Lumber and cooperage materials—The only arrival in pitch pine is 350,000 feet by the s.s. Frednes from Mobile. A prompt cargo or two of good quality suitably assorted for this market's requirements would find ready sale at full rates, but there are ample stocks of American and Canadian white pine at present.

Contracting as a Side Line for the Retailer

By W. A. Cavin.

To begin with, I am quite sure that those retail lumbermen who do a large general contracting and building business will quite agree that it is about the biggest side line you ever took on. To me the simple running of a lumber yard,—doing nothing but buying and selling lumber—would be a paradise, a dream of comfort and ease, traveling a path of roses with expenses paid by cheques from home. I used to wonder how my good friend and neighbor could spend half the summer season away from his yard, basking in the sunshine about his summer home on the lake,—how so many of you could afford to chase about the country seeking rest and relief from the heat of the season while I, with a greater desire for rest and a less inclination for work than anyone else, had to keep up the daily grind from spring until winter. A little study solved my query—All in the world you have to do from one year to another is to buy and sell lumber. What a cinch!

In a general way this contracting game reminds me of a planing mill proposition—a necessary evil under certain fixed conditions and a positive necessity when once established. Beware, brethren, do not be the first to offend by starting this game in your locality. It means work and worry to start with and more of the same as the game progresses.

To win you must be a walking dictionary, nay more—a practical architect, mechanical engineer, plumber, painter, decorator, carpenter, mason, roofer and a man with keen ability to handle and govern the many varieties of tradesmen—all this in addition to being a real live retail lumberman. Was there ever a man so generously blessed with so great an abundance of knowledge and skill? Well, none of us are perfect and all of us will fail somewhere whether we are a lumber dealer, a contractor, or both.

Disadvantages

You will grant that the big men in business, those who have won the greatest victories, have accomplished their ends by concentration on one single thing, by making no division whatever of their energies. In proof of which I again use the planing mill. Run as a separate and distinct business there are many mills paying large dividends; while, in connection with the lumber yard, a profitable mill is about as hard to find as a lumberman's profit in the chicken business. So with contracting as a side line for us. Unless the boss is hanging around the job or about the yard one or the other will suffer in his absence and if each drags half of the time, it is the same as if one was running itself all the time without a head. No business will run itself. Met Saley has spoken thus and his word is final. I make the assertion that no man can, by his own efforts, successfully run a lumber and contracting business. He must shift the active, mechanical work to other shoulders and share only in the financial responsibility and profits of the combination. In this manner each department has its governing head.

Conditions established by long years of precedent govern the advisability of this so-called side line. The community acquires the habit of doing business in certain ways. To radically change these methods of doing business is not an easy thing. Therefore a new dealer coming into a town in which lumber dealers do contracting is driven to the same business to find a market for his lumber.

Advantages

Granting all the above disadvantages in this business game, there are many both pleasant and profitable things to be considered. I once knew a dealer in a one-yard town who had been a successful contractor during the earlier years of his life and, like many others, drifted from that to the lumber business. He believed, though seemingly quite contrary to most present day contractors, that he ought to have a fair profit on material sold and he practised his convictions. The other contractors in his town, growing dissatisfied, began to buy their lumber direct and boldly claimed they would show him a thing or two. "All right," said my friend, "two can play your game." He got busy at once, jumped into the contracting business himself and with his yard to fall back on, outbought and therefore outfigured the opposition until they were willing enough to sue for peace and buy at home. Thus the poacher was kept out. We figure with instead of against our contractors, sublet them work and in many ways use our contracting department to regulate our local trade conditions.

We sell labor as well as lumber. All the time some of our men are doing repair work by day labor, both in town and out. On their time should be made from 25 to 50 cents a day. Of course our customers buy the lumber as well as the labor of us, and the value of a large trade in repair lumber, small additions, roofs and porch work is well known.

If you govern the contract business of your city you are free from bowing and scraping to the other contractors. You govern them instead of their governing you. You make them take and use what you have to sell instead of their dictating to you and exercising every prejudice and foolish fancy against your stock on hand. The contractor is not then the all important factor in your business, to be looked up to, catered to and obeyed.

Collecting

Collecting is a mighty important factor in our business. It is said that the last account anyone pays is his lumber bill. We find that it is much easier to collect all of an actual bona fide building contract, extras included, than it is half the amount in a straight lumber account. Most lumber bills sold in the smaller places go out on good will without a properly signed contract. This condition is just the reverse with general building work. It is easy to get a signed contract and the collection is likewise simplified. The contract account is thus protected by legal agreement, while the lumber bill is sold on good faith.

The cost of selling lumber should be less with the contracting side line than without, because you are selling a large majority of material to yourself instead of to outsiders. Neither of our yards does any advertising except what is necessary for local charity and benevolence. We are also relieved of the waste on poor material returned from a job, for we use this again, at full value, on some other job, whereas we could not realize its worth by selling it to some other contractor. There is less picking over of stock and throwing out this, that and the other into degrade or trash.

Forgotten Charges and Dead Stock

Yard men constantly forget to make charges. If these neglected items go to our own jobs and the contract was figured right we do not lose, as would be the case with an outside contractor who paid in the end only what our books said he owed.

There are a few of the things to be said in favor of a contracting business in connection with a retail yard, but the greatest of all is the ease and profit with which you can work off dead stock and odd patterns of this and that which you are able to pick up so often at bargain rates.

In this way there is a legitimate double profit—that from your lumber and a part of that from the contract itself. We keep the two branches of the business absolutely separate, charge the material on each job to ourselves at retail prices, charge the labor to each job weekly and at the end charge our part of the general contract profit as so much gain on the labor cost of the work.

To sum the matter up, I should not advise any one to jump blindly into this side line, if he already has a good profitable lumber business and if his locality does not demand the venture. The extra profit made in the contracting business does not come easy but is earned at the expense of much time and worry. However, it is interesting and a profession of the highest rank.

Free Delivery of Lumber

The question of whether lumber should be delivered by the dealer, or the purchaser be compelled to come to the yard and take it away, has probably been a topic for discussion since the first retailer of lumber went into business.

In most talks on this matter the subject has been considered as dividing into two distinct parts, one relating to the city yard and the other to the so-called country yard, but the problem is the same to both and should be so considered.

In the first place it might be asked—Why should we deliver? And my answer would be, because it is a legitimate part of our business, and having the proper facilities and men trained for the work, we can handle the stock cheaper and deliver it at the job in better average condition than can be done by hired draymen.

The second question might naturally be—How far should we deliver? And my answer would be, just as far as the expense involved is covered by our price to the customer.

We thus have two important points for consideration, and of sufficient weight to warrant a more detailed discussion.

Delivery should not be considered as something forced upon us, perhaps by competition, but rather as a part of our business we are glad to control, and as much a part of it as unloading from car and piling in shed; for it insures satisfied customers, and the placing of our goods on the job carefully and as wanted and without the damage easily done by careless handling.

As the Customer Sees It

Let us look at this matter from the customer's point of view, and if we put ourselves in his place for a moment we will see that in all modern mechandising delivery is an essential part of the business; all the customer is asked to do is to select and buy the goods. The merchant does the rest.

We will also see that lumber is a bulky commodity requiring special facilities for safe and economical handling, and the purchaser should not be required to provide such facilities for perhaps a casual

purchase or to take the time to hire someone to handle it for him and assume the risk of careless handling.

So from this standpoint there is no valid argument against the delivery of the goods we sell to the community dweller, anyway, and to all where dictates of economy will permit.

We now come to the points of difference usually made between the city and the country yards, but the same underlying principle governs both, subject, however, to the limitations imposed by the answer to the second question—How far shall we deliver?—And to some extent by the class of people patronizing the individual yard.

In general it may be stated that all yards should deliver to all parts of the community where located, the boundaries being roughly determined by the dividing line between the more settled sections of town workers and the farming or gardening sections who have horses or teams of their own.

This will perhaps be further determined by the fact that from the first class, or town workers, having no facilities of their own, you can add to your price a fair rate for delivery within these limits; while beyond that point the buyer can handle it cheaper than you, and, buying as he does at the yard, it is up to him to handle his own carefully.

The limits of delivery being determined, it is not much trouble to ascertain the cost of maintaining that part of our service and its proportion to the amount of our sales, so that we have a definite percentage or amount to take into consideration when making our prices.

The point has sometimes been raised that it is unfair to make an average rate for delivery, and in some places lumbermen have tried varying prices based upon the distance from a central point. But this is contrary to the custom of all other merchants, whose experience has shown that one price to all within determined limits is right and the average expense is fair to all.

The item of delivering varies, of course, in different communities and generally speaking, increases with the population; so that a city yard having long distances to cover has to maintain a proportionate force and outfit, while in the country yard the teamster may also work most of his time in the yard; thus making a very material difference in the amount of this item to be provided for.

It is also contended by some that a yard should maintain two prices, one covering delivery and the other at the yard; but as shown above in cities where the delivery item is largest only a very small percentage of the lumber sold is taken away by the purchaser; whereas in the country yard where the largest part is so taken, the delivery expense covered in the price is a small item and does not more than compensate for the extra time and trouble in showing and loading the customer.

I am a firm believer in one price for all and see no unfairness in making everyone contribute his share of our average profit, rather than to figure out each individual transaction by itself, which, of course, would be impracticable.

Not an Evil

To my mind the most important part of this subject has not often been considered owing to the general attitude regarding it.

I think we should forever dismiss from our thoughts the idea that this is an evil, necessary perhaps, but nevertheless one of the most obnoxious parts of our business, and look at it as other up-to-date merchants do as an integral part of modern merchandising. When we take that attitude we will aim to improve our service and make it pay. Here is where we have been often decidedly wrong. We have regarded it as an expense, whereas it should and can be made to pay its share toward our support.

Let us eliminate the word "free" from this topic, as we must confess that it indicates a lower business ability than we are supposed to possess, if in this day and age we are doing something for nothing, or, to say the least, without adequate compensation.

Money Saving Yard and Office Devices

By H. J. Jackson.

I do not know that I can tell you anything new about economical and money saving yard and office devices. Every year brings new business conditions, to which we must adjust ourselves as best we can; taking advantage as we each of us see it of every turn and change in the situation. New conditions bring new requirements of stock facilities for handling it and added facilities for accomplishing these ends. This applies to both the yard and the office.

It is a cardinal sin to pile incoming stocks of lumber, lath and shingles on top of old stock; better move the old out and put it one side to dispose of first; or if pressed for room pile back on top. It has become an axiom with the retail yard man that a nicely kept stock and a clean yard are about the best paying investments that he makes. Sharp competition and the close margin on which the average retailer has been compelled for a number of years to sell his stocks of lumber have put him in touch with every modern and up-to-date method of doing business. There have been many much needed changes in the manner of conducting a retail lumber office.

A Complete System

I will illustrate our method of handling the business in our office from the time it originates until it is entered in our loose leaf ledger. We have no lumber order book. Orders are made in duplicate, the yard ticket or loading ticket on a salmon red paper, and office copy—both being made at one time by the aid of carbon paper—on white paper. We have a small file or receptacle with three compartments accessible from both sides of the main office desk. Those orders which are for immediate delivery are put in the top till or compartment, those which are for later delivery or for delivery on a stated day are put in the middle compartment and a record made on a calendar kept for the purpose. Those orders which have factory work on them which also carry other stock which is to go at the same time are put in the lower till. The factory orders are checked off these red tickets on a sheet of yellow paper and when the factory order is completed it is returned to office and attached to duplicate ticket in lower till and placed in middle till. The tickets in upper till are gone through every morning and noon by the man at the desk together with the yard foreman so that orders will not be overlooked or delayed. The white ticket or duplicate goes into a book file.

The original orders or red ticket is sent into the yard for shipment and as each item is loaded it is noted with a check mark in front of it on a blank margin, or so much of it as has been sent. The ticket then goes to a man who enters it in a four-copy autograph registering machine, and the date of shipment is placed on ticket in ink over each check mark. If the ticket is not all checked out it is put back in the top till of the file in the desk so that the yard man may go on with the deliveries.

Handling of Invoices

The four invoice or tickets that go through the machine are for disposition as follows: Delivery man takes two copies with him in an aluminum book especially made for the purpose; following the usual course of leaving one, getting the other receipted and placing in book and returning to office. Unless it is a C. O .D. order the tickets are not extended, except as to feet extensions. The third copy, when the price is extended and checked on the following morning, is mailed to customer. Sometimes when a large or continuous order is being filed, we bunch two or three days' shipments in one envelope to save postage. Numbers 3 and 4 tickets go on to a desk where the bookkeeper or his assistant takes the duplicate white order from the file and checks from it what has been sent and date of delivery. When the white ticket is all checked off it is taken out of the file and destroyed. The original or red ticket when completed is placed in a file in the vault, and kept there until the end of the year, when the file is emptied and the tickets are placed in cheap boxes with alphabetical separations between them, as in the original files. These are kept for two years more and then are destroyed. The receipted delivery tickets or invoices are placed in a sort of file made for the purpose, each month by itself. All invoices or delivery tickets are consecutively numbered. Printed on the No. 3 ticket in very plain letters are: "This is your invoice; preserve it for reference and settlement. We do not invoice again."

Ledger Entries

In making the entries in our ledger the items are not recorded, just the number of the ticket, the date and the amount in dollars and cents covered by it. The monthly statements do not cover any items, just ticket number so-and-so, with extensions to correspond with the ledger. We find that if any special contract has been made it is best to put these prices on the white ticket so that when the extensions are being made the prices can be found readily, if they are out of the usual course of business.

The way we file the original tickets or orders enables us to tell a customer just what he ordered at any time for three years back with very little trouble. We find it very handy to convince some forgetful customer of his error, as we in all instances check back or repeat the order at the time if it is given over the telephone or any other way except in writing. We preserve all such original orders in a file kept for that purpose and that, too, saves many an argument.

Competent Office Workers Needed

I think this covers all I have to say in this respect, as the balance of the work is merely a matter of correct bookkeeping. We find that under the present car demurrage rules it is very necessary to keep a car record ourselves and not leave it to the railroad. For they have very bad memories, and are not always fair. On receipt of an invoice an entry is made showing whom it is from, car number, where shipped, when received, or the date of its arrival, when placed and when released. Since the first of last December we make the car checker settle with our man every day as to the state of every car on our tracks and then there is no after dispute and we

can have our scrap with them while everything is fresh in our memories.

We find from extensive experience that cheap, incompetent help in our office is a bad investment, and while we try to keep down expenses in every way, think it is poor policy to try to work too cheap help in our office or in responsible positions in the yard.

Holding the Trade

How the Local Dealer Can Keep Business at Home

A number of interesting and instructive communications have been published offering suggestions and ideas concerning the catalogue house problem, but it is to be regretted that a large number of those who are especially well qualified to offer counsel and advice do not seem to have the time or inclination to assist their less fortunate brothers, says the Mississippi Valley Lumberman. This new form of poaching on the trade of the legitimate merchant is of somewhat recent origin and accordingly it is not to be presumed that the ordinary individual dealer would, from experience, have acquired an adequate knowledge as to just how to successfully combat these pernicious competitors. For that reason a very general exchange of ideas should be helpful and beneficial to the rank and file of the retail lumbermen.

In discussing trade topics, frequently retail lumbermen will refer to some recent experience they have had in competing with the mail order house and with a good deal of satisfaction relate how they had been able to get the better of these competitors. For the benefit of our readers, it occurs to us that some of these experiences might be of value.

A dealer who resides not far from the headquarters of one of these mail order houses confessed that for some time he had not exercised good judgment or discretion. Intent upon the laudable ambition of retaining the trade of the community, he had blindly made quotations which he found later were far less than these mail order houses were offering to sell the same class of material. This experience had demonstrated to him the necessity of knowing definitely what prices these competitors were making. The mail order houses he had found, were as intent upon making as liberal profit as any dealer. In order to do so, however, they were frequently compelled to make misrepresentations and practice deception. As a result of some judicious missionary work on his part and that of his local competitor, the prejudice that unfortunately had existed in the minds of the public against the retail lumbermen had been very generally effaced.

A few years ago these direct-to-the-customer concerns were regarded as special protectors and friends of the much abused consumer. The absurd claims they were making and the unscrupulous manner in which they attacked the legitimate lumberman had, at least in their community, produced a general mistrust and a prejudice against these concerns. In his opinion, the sooner the local merchant accepted this new competition as an established fact and adopted efficient and logical means for meeting this competition, the better it would be for the retail lumbermen. While condemning their policy of practising fraud and deception, he admitted that they represent the highest type of modern merchandising. They knew the value of suggestion in stimulating or creating trade. For this purpose they were spending millions of dollars in advertising and sending letters, circulars and pamphlets through the mail.

Catch Prices on Minor Items

Another lumberman, who presides over a small system of yards had been giving careful consideration to this mail order problem. Speaking frankly, he said: "I have come to the conclusion that the average retail lumberman has been making a mistake in adhering to time honored customs. It has fallen to the lot of the local dealer to handle a lot of small odds and ends and we have rightly considered that we should get a liberal profit for the sale of these speciaiities. Take for instance the item of eight-inch spindles. I don't suppose that the total sale in small lots of these articles would amount to more than 50 cents a month. The established retail price for this kind of spindles is 5 cents each, although at wholesale we buy them for about 1½ cents. The mail order houses, I find, are quoting these spindles at 2 cents each, f.o.b. their freight warehouse. Another article which the retail lumberman sells occasionally is thresholds. We buy them at wholesale for about 5 cents and we consider that we ought to be able to sell them in small lots at 15 cents. We all know that the customer who comes in to get one of these household articles usually wants to pick over our whole assortment, uses a lot of our time, and frequently asks us to wait indefinitely for our pay. These mail order houses list these thresholds at 5 cents. One party who was in our yard not long ago getting prices on a half dozen thresholds, became very indignant when our yard man asked him 13 cents each, and claimed that he could get them from the catalogue houses for 5 cents. Our agent, however, was able to show him that the cost, including express charged and the exchange of the check or money order and the postage required would amount to approximately what we were offering to sell them to him, delivery to be made immediately. When we furnish a house bill where a number of thresholds or spindles are used we have never adhered to retail prices. In studying this problem, however, I have come to the conclusion that it would be a good policy for the retail lumbermen to adopt some of the catalogue house methods and offer to sell some of these small specialties at approximately wholesale price. The amount of profit lost would not be very large and I believe would be efficient advertising."

Apparently, the ambition of a great majority of the public is to get something at a very much reduced cost. The science of modern merchandising takes that fact into consideration. To attract the trade, the big department stores will offer a few staple articles at ridiculously low prices, knowing that the amount of material purchased by those seeking to take advantage of the bargain materially stimulates the trade and produces a very substantial profit on the entire sales. Why shouldn't the lumbermen adopt some of these means of stimulating their trade? This can only be done by offering some real or assumed incentive to attract the prospective consumer. The keynote of success in the commercial world to-day is advertising. Mail order houses have to depend entirely upon printer's ink. The local lumbermen can use to great advantage his personality and acquaintance. The dealer who makes his yard and office attractive and encourages the use of his establishment as headquarters for the farmers coming to town or for a general rendezvous for responsible business men in the community, is doing effective advertising. The lumbermen can well afford to take a personal interest in the affairs of the community and either personally or by a competent employee call upon as many of the regular and prospective customers as they possibly can.

Interest The Yard Manager

In discussing this mail order house competition with different retail lumbermen, I have come to the conclusion that the local managers in charge of the yards operated by the big systems, must be induced to do their part. As a class, the agents are broad minded, enterprising and practical lumbermen. Unfortunately, however, some of these agents are not using pudgment and discretion in meeting this new complication incident to mail order house competition. It is a well known fact that all goods purchased from the mail order houses are paid for before the goods are delivered, the consumer also assuming the expense of taking the material from the car. Experience has demonstrated that it costs at least 5 per cent. of the value of ordinary building material to take it from the car, store it in the yard and deliver it to the customer. There has been a number of instances called to our attention where some local manager has insisted that the company give him the privilege of selling a bill of lumber at the prices quoted by the catalogue houses although the material was to be taken from the yard and there had been do definite agreement made as to the time of payment.

Some of the line yard systems are adopting the very logical policy of offering the consumer his choice of two propositions, one contemplates selling the material on exactly the same terms as those demanded by the mail order house and the other grants the usual concessions which have been given by the retail lumbermen for years. The ordinary bill of lumber sold by the local dealer is delivered as the material is needed, often with the privilege of making substitutions and changes, besides returning any material which has not been seriously damaged. Such a definite policy, we believe, is the only logical way of handling this mail order house competition. The retail lumberman, whether he operates an individual yard or a big system, must insist that the consumer live up to his part of the agreement and if they buy for spot cash and assume all expense of unloading, the money is to be paid when the material arrives and the buyer assume the loss from any errors or mistakes which he, the contractor or carpenter has made.

Eastern Spruce in Good Demand

Chase, Talbot & Co., New York, report under date of Aug. 1st as follows: There is a generous demand for lumber in the Metropolitan market, eastern spruce commanding particular attention. Real estate is showing some signs of increased activity. Yard dealers in lumber report a healthy and substantial trade. Wholesalers are kept upon the move, while the mill men advise that they have booked dimension orders sufficient to engage their mills for the next few weeks. We shall be surprised, as well as disappointed, if prices do not hold firm throughout the balance of the shipping season, with a volume of business fully equal to the capacity of the mills. We repeat quotations as follows:

Spruce 2 x 4 desirable lengths $23.50 to $24; 2 x 6, 2 x 8, 2 x 10, 4 x 6, and 4 x 8, fair run random lengths $25; 3 x 8 and 3 x 9 $25; 2 x 9, 2 x 10, and 2 x 12, or 3 x 9, 3 x 10, and 3 x 12 $26 to $27, according to lengths. Dimension spruce $24.50 to $27.50.

THE WOODWORKER

Making Shaper and Sticker Knives

By Cyrus L. Oakley

In answer to a recent inquiry I have submitted a series of drawings, with full explanation for laying out and making both, endeavoring to make it all so plain that any one who may be interested in such work can easily determine how to make knives for either machine.

We will first consider the molder, on plate 2. Drawn and sectioned is the end view of a molder head—sectioned for the purpose of making it distinct from the two others drawn in full and dotted lines. This is about the standard size for 5-in. to 7-in. molder. The other two are perhaps larger than any standard size for 7-in. to 12-in.

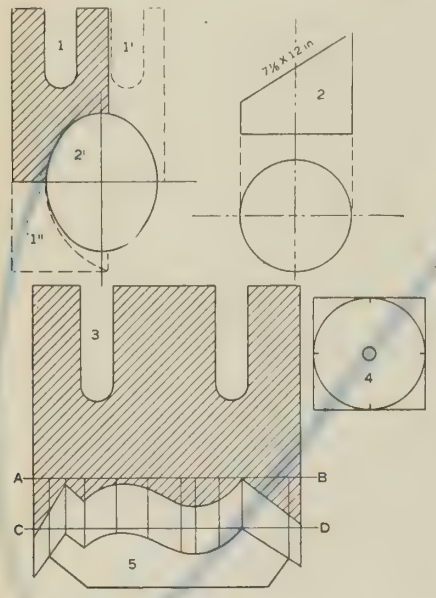


Plate 1

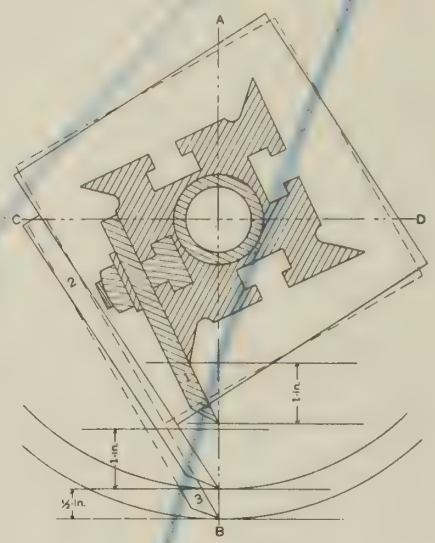

Plate 2

machine. This is done to show the difference in position when cutting one standard inch in depth and the same sized head cutting 1½ in. deep.

It seems to be quite a serious question with some operators just how to make cutters in the most practical way and have all the different members on a detail to pan out to the drawing. The first thing to do is to take a flat, clean piece of board, joint one edge straight, 8-in. or 10-in. long and 6-in. or 8-in. wide, and in centre of length lay on your square, and with a sharp knife make a nice mark across the board, then from the jointed edge gauge a fine line parallel to the jointed edge. Now take a nice, clean, firm piece of cardboard or thin wood, large enough to make a square with a diagonal equal to the sweep of any sized head desired, on line A B C D of plate 2. For example, at the intersection of these two lines press the point of a common pin, holding your thin template in centre, and at the same time allowing it to be moved back so as to get any desired pitch for cutter. Place it on your board, and, parallel to horizontal axis of revolution, draw another line just at the extremity of the corner of the thin template, after bringing its corner to the vertical line as A B, plate 2, thus locating a definite starting point. Take one standard inch from this, then draw another line. This determines the exact distance the cutter projects over the lip on your cutterhead and also shows the exact pitch as taken from a steel square on plate 5. Now, if you wish to cut 1½-in. deep with the same sized head, just draw a line 1½-in. down from the first line, swing your template back until, by placing a short straightedge against the side on which the cutter is placed, your straightedge exactly strikes vertical line A B, plate 2. For making cutters for any nosing, quarter-round, half-round, also true coves of any dimension, take the pitch at which the to take a piece of wood large enough to make a right cylinder, as in plate 5. For small details I advise, for convenience and exactness, to take a piece of wood large enough to make a right cylinder, as in Fig. 2, plate 1. Centre it perfectly, leaving centre marks across the end, as in Fig. 4, plate 1; then turn to a given size; then, after having taken a square stick somewhat larger, and centering it, bore a hole through it just right to push the turned cylinder in; push it in, bring the centre in line with lines on end of the bored shell, tack a small brad in left-hand end to keep in place, then any time desired take the pitch you wish from your drawing, either for shaper or molder, and mark across the top the bevel, and down side toward you with a try-square, and cut off with a fine saw. This gives you a perfect quarter-round, as shown at 2', plate 1. For half-round make knife by one-half figure, etc.; for example, see 1 1', plate 1.

For making true coves employ exactly the same method, only fitting knife to inside of figure instead of the outside. Rounds, beads, heads of different sizes and different sweeps, all have different pitches—see drawing for illustration. In duplicating or reproducing any molding on molder or shaper, cut your pattern in miter box, any pitch desired for various sweeps, tack it on the bench, place your blank cutter against part so cut, lifting high enough to take in all the members, mark around each member with a fine, sharp pencil, first chalking if necessary, cut to these marks on emery wheel, then grind back to the desired bevel, cut in bolt slots for molder bevel to fit collars for shaper, then temper, and you have a perfect cutter for either machine. (See Fig. 1, plate 5).

Fig. 1, plate 4, shows method of making gauge for setting molder knives. On plate 4, Nos. 1, 2 and 3 show the distance each of the cutters projects over the lips of the cutterheads on plate 2; 1, 2 and 3 at the bottom each space equals 1-in.—No. 1 for cutterhead No. 1, No. 2 for cutterhead No. 2, etc.

On plate 4, at J, is shown a distorted figure. You could not make perfect cutters by such a figure. Also, in Fig. 2, plate 4, in dividing up the lip projections, parts ending at the waved line indicate imperfect measurements, leaving spacing irregular, therefore measure with great care to get good results.

To successfully divide any minute fraction of an inch, take the inches and fractions on a base line, draw a perpendicular to base, and set off the desired space. In this case 1, 2 and 3 are each to be divided into eight equal parts. Place your triangle scale rule on left-hand base line, and move back to the perpendicular line until you have 8-in. Draw a fine line, divide into eight equal parts, and intersect; the development will be the desired result. Take the parts so obtained and lay off on a piece of wood or metal, as shown on plate 4. At top of plate, on right-hand end, are shown the parts for laying off knives for the projections, lengthwise, standard inches and fractions, for width of molding. You can subdivide to any part of an inch desired. If made of wood, stick a brad in right-hand end, hook over end of cutterhead, and so set your cutters.

On plate 6, Fig. 2, is one correct method of laying off a graduated scale, which meets about all demands for molder heads of all sizes, both for setting cutters and laying them out. A brief explanation will make this clearer. First, draw line E F, then line F B.

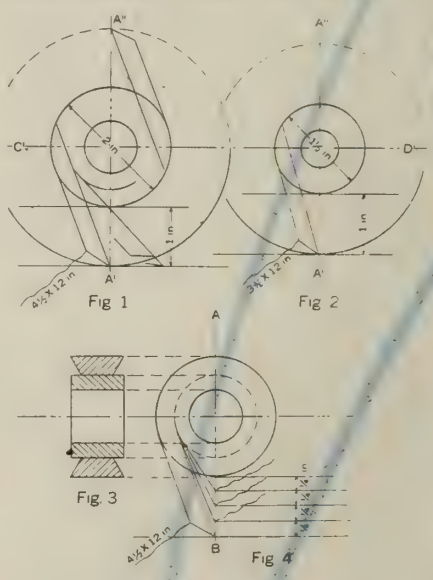

Plate 3

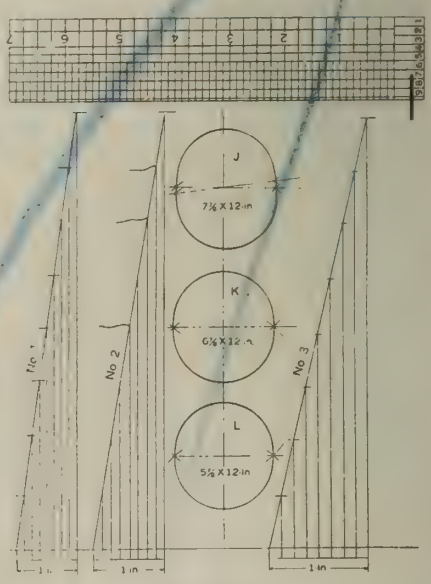

Plate 4

Then, at a point on line F B equal to the minimum and maximum—i. e., the sum of the base of Fig. 1 and Fig. 3, plate 4—draw a line parallel to line E F, on C D. Divide this line into sixteen equal parts. Then from the right angle over at C, on line C D, draw lines as indicated in Fig. 2, plate 6. First stick a fine needle at F. Push your rule against this needle and draw lines beginning at the right, so, if drawing in ink, you will not blot the lines. After having done this, take two needle-pointed drawing dividers, set one equal in space to one of the divisions in Fig. 1, plate 4, the other equal to one division of Fig. 3, plate 4. Lay a keen-edged triangle scale rule across these lines, as at X X, moving it in such position that at left-hand end the first space on the diagonal lines equals the space taken by your dividers from Fig. 1, plate 4, and the right-hand end equals the part taken from Fig. 3, plate 4. At each intersection of such lines draw lines

parallel to line F B, terminating at line A B. All the space indicated between the two arcs makes a complete and perfect graduated scale, which properly applies to cutterheads for molders of any size, providing the minimum and maximum sweep in these drawings are not exceeded. This rule is very accurate within itself; if the intersecting is perfectly done the development will be satisfactory.

Rule for Setting Shaper Knives.—On plate 6, Fig. 1, is shown a method by which shaper knives can be accurately set. It is evident by examination of Fig. 1 and Fig 2, plate 3, that different sized collars and different sweeps for shaper cutters all give different angles by which cutters are made, hence the different angles on Fig. 4, line A B, and Figs. 1 and 2, lines A″ A′, plate 3. The difference is small, but there just the same. For a handy gauge take a thin piece of wood or metal, like Fig. 1, plate 6. With fine-pointed dividers lay off, first, the outside diameter of collar. Next, inner line of groove for cutters. Then describe arcs from centre or axis of revolution, say by ¼-in., any reasonable number. Subdivide if desired. Draw two fine cut lines through centre at right angles, and on lines A, plate 6, open in centre, leaving Fig. 1. Raise collar until pattern or gauge presses under, first having removed section part in plate 6, then press snugly against collar. Bring cutter point at arc on line B C.

Laying Out Knives for Molders.—Take, for example, plate 1, Fig. 5, a full-sized detail molding. First draw a line above molding, as shown at Fig. 5, just touching its thickest part, line C D, any respectable distance parallel to and, say, 1-in. above. Draw another line, A B, at the extreme lowest and highest points on detail. Draw per-

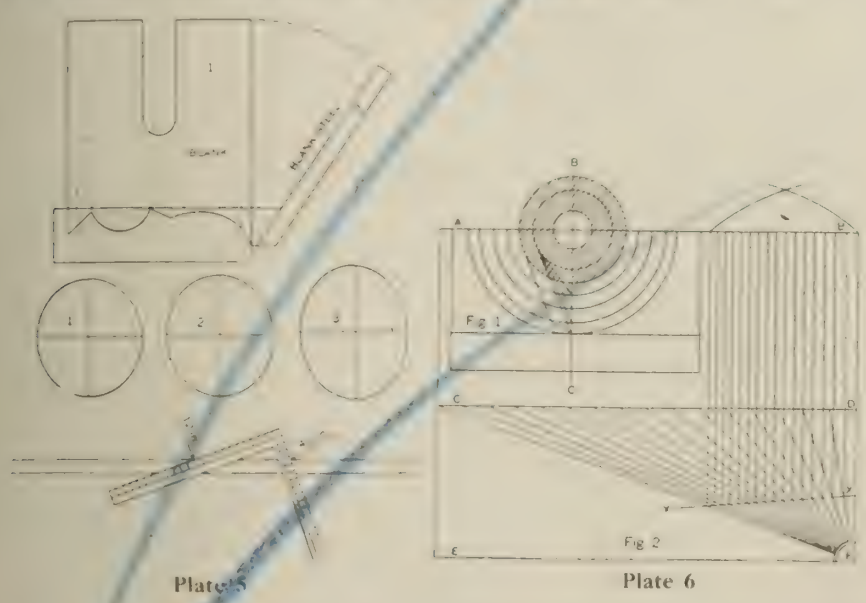

Plate 5

Plate 6

pendicular lines parallel to one another, terminating in line A B. Then with a standard rule measure the distance drawn on the various lines from line A B, noting each measurement, then use the measurements on the graduated scale for the distance down, locating the different spaces in width by the standard rule. Make a small dot at each measurement. Draw in curves free-hand, and all other parts by straightedge. It is well to draw intermediate lines, thus aiding greatly in drawing in free-hand from point to point.

I would suggest that if one wishes to make drawings for different sizes of quarter-round, coves, etc., he make them on firm, clean paper (of course, blueprints are better), and paste them between two pasteboard covers. When grinding cutters open up this book, lay it by your grinder, grind and fit your cutters, close your book, lay it away until wanted again.—The Wood-Worker.

Increasing Kiln Capacity

A large tight barrel manufacturing concern has recently evolved an idea which may be applicable to the hardwood and consuming trades. It is offered merely as a suggestion, and with the knowledge that there are some apparent weaknesses of the plan which practice may show to constitute insurmountable obstacles. The plan, in short, is to cut stock to size before, instead of after, kiln-drying, so that the process of drying may be hastened and the efficiency of the drier increased.

In the case referred to, the barrel man has found it rather inconvenient to put a lot of stock through the kiln and then after tying up his drying equipment with this material for a couple of weeks, to find that some of it has to be thrown out for use in another direction, because it is not of the proper grade for the job in hand; and also that by cutting to size and planing, a good deal is taken off so that the material actually used is much less in volume than that which occupied space in the dry-kilns. His idea is to dry the staves only after sorting, cutting and planing, in order to make the kiln do one hundred per cent. of work.

Some of the points which apply to the cooperage business do not affect the ordinary factory using lumber, nor the hardwood mill which does much cutting up. The main consideration—that of making the kiln-space more effective—is one worth going into, however, in view of the expense of operating a kiln, and the fact that steam costs money. Certainly there is no use in wasting drying efficiency if it can be profitably employed.

The obvious objection to the plan of cutting to dimensions before drying is that if any defect is caused by checking or splitting, the piece is ruined for that particular use. To meet this possibility by leaving sufficient margin would, in the first place, require the stock to be reworked, and thus do away with any advantage which had been gained; and in the second, would increase the proportion of waste, which, in most plants, is great enough as it is.

It appears, therefore, that if the plan is used, the material would have to be cut to the exact size required plus an allowance for shrinkage. In order to prevent losses through checking or cracking, more care would be required in drying. Perhaps this would not be such a bad thing after all, for it is certain that the operation of most dry-kilns is not attended by what might be called scientific exactness. Most users of lumber know about how long it takes to dry lumber only in an approximate way. Usually no exact figures are available, and of course allowance has to be made for the condition of the wood at the time it is put into the kiln.

If the possibility of loss were present, and the superintendent knew that his drying had to be done properly in order to prevent damage, it is likely that greater care would be used in determining the proper methods of drying, and in avoiding the harmful developments which at present mark much drying of lumber. Nobody wants to make the process any more difficult than it is, and it is therefore certain that if the drying of dimension stock were accompanied by extreme difficulty, this consideration alone would be sufficient to cause the plan to be rejected.

Undoubtedly, however, dressed stock dries more rapidly than rough lumber. Planing it, before preparing it for use in the factory, removes the surface which has gradually hardened because of air seasoning or from being kiln-dried at the mill, which makes drying a slow process. If the surface had been gone over before the final stay in the kiln, the warm air would get to all pores of the wood more rapidly, and the moisture would be driven out in a fraction of the time required under ordinary conditions. In the cooperage plant referred to, experiments have shown that the saving in time on this account amounts to fully one-third.

Right along the same line is the question of case-hardening. This is usually the result of partial drying previous to being placed in the dry-kiln. By reason of the first process, the portion of the wood near the surface had dried out, and the interior had remained as moist as before. Shoving it into the dry-kiln in this condition, especially if the operator is not conservative in the matter of temperature, has a tendency to complete the drying process, as far as the surface wood is concerned, leaving the remainder as unseasoned as before, and making results extremely unsatisfactory. There seems to be good reason to believe that if the lumber were dressed before being dried, and the surface so opened as to make access to the pores of the wood certain, the chances of honey-combing or case-hardening would be greatly lessened.

There is a wood-worker in an Ohio Valley city who uses beech. Everybody who has ever handled this material knows how hard it is to dry. In this case especially thick stock is used, and the manufacturer was wont to fill the atmosphere with sulphuric exhalations because he was tied up more frequently than he would have liked by reason of slow drying of his material. It may be mentioned incidentally that his kiln was a little weak in construction, though that is not the point. The problem of getting that beech into shape in quicker time was discussed many times by the manufacturer and his assistant, and no one seemed to be able to get farther than the suggestion that a new kiln be installed. This did not appear to be practicable, as far as the manufacturer was concerned, so they had to find the answer at the other end of the proposition.

Finally a lumberman who had had experience with beech suggested that it be worked first and then dried. This, he pointed out, would expose fresh surfaces for the percolation of the heat, while the fact that it dried slowly anyway made the danger of splitting less prominent than it might have been with other woods or thinner stock. The idea was seized with the eagerness with which the proverbial drowning man catches a straw. It was tried, and has succeeded. The manufacturer unloads his lumber from the car right into the factory, as he usually buys it for immediate use, and rips and saws it to the exact sizes required by the line of goods he is putting out. Then, at first with fear and trembling, and later with more confidence, he puts it into his dry-kiln.

The latter is rather old and leaky, and consequently the temperature is never excessive. The drying process is as slow, comparatively, as the most extreme might require. The consequence is that there has been little trouble experienced from damaged stock due to too rapid drying, and when the material has been in the kiln the

proper length of time, which is of course much less than when it is dried without having been dressed previously, it is ready to be finished and to go into place in the goods. In few cases has it failed to give satisfaction.

Absolute loss in case of checking in the kiln would be suffered only in the case of small sizes, which could not be reworked into something else; the larger pieces could be cut down to the smaller dimensions used and thus the loss held to a minimum. But of course if experience suggested that there would be a good deal of splitting or checking, it would not be wise to attempt the plan.

There are some consumers of lumber who carry no stocks on their yards whatever. The tendency to leave the seasoning of the stock to the lumberman, and to trust to the dry-kiln to cure whatever defects of this kind are still in evidence, is growing, and will continue to exist as long as the consumer can get his lumber with reasonable facility when he is in the market for it. The fact that the smaller furniture factory, especially, dislikes to tie up much capital in lumber, and buys for immediate consumption, means, again, that greater reliance is placed on the dry-kiln than in the past. This suggests two things: That the maximum efficiency is required of the kiln, and that the greatest possible care be given to the stock which goes into the drier.

These two conditions seem to be met by the method of putting the stock through the first stages of manufacture, at least, before drying. The manufacturer who is in a hurry to use his stock can thus do part of the work on the lumber without waiting for the over-burdened dry-kiln to get it in condition; and the latter can get stock through and ready for finishing so much more rapidly that an appreciably larger amount of lumber would be handled. Since the consumer referred to does no air-drying of his own, he must use his kiln properly if he is not to spoil his lumber; so that the accurate methods required where dressed stock is dried would fit well into the demands of the situation.

Allowance would have to be made in drying for the shrinkage caused from this process; but as this is known pretty accurately, there would not be such difficulty here as sanding would not take care of. As stated, the general idea looks as if it had possibilities, and the only question is whether the practical difficulties in the way of its adoption are not too great. The plan is at all events worth considering.—Hardwood Record.

A False Ideal

A panel manufacturer who has done a good deal of missionary work among the piano trade, and who has found that those in that line in most cases are less responsive than others to the arguments which are made in favor of having glued-up stock manufactured outside the factory by a specialist in that branch, has come to an interesting conclusion regarding the reasons for this attitude.

It is that the manufacturers—that is, some of them—don't want to save money in the production of their goods.

That probably sounds peculiar to the average lumberman and panel manufacturer, but the logic of the situation is in favor of the member of the trade referred to. He has the facts.

He visited a piano manufacturer some time ago and talked to him with the idea of selling him some built-up stock. This particular factory, by the way, turns out a well-known instrument, and one which sells for a considerably higher price than the average.

"No," was the imperturable response to all arguments of the panel man along the line of getting better results, eliminating the possibility of loss through imperfect work in his own shop, convenience in operation through the reduction in equipment and labor expense for operating the glue-room, and all other effective appeals which have resulted in the panel industry making great headway among consumers of veneers. "No, we lay all our own veneers. We are not interested in what you have to say. We don't intend to change our methods, which we have been using for many years. We are successful, and we see no reason for altering a winning combination."

Those were not the exact words of the piano expert, but that was the general tenor of his remarks. He made it perfectly plain to the panel man that the latter couldn't get any business there if he offered to sell his goods at cost, less a five per cent. discount for cash.

A little later on, the same panel man—who seems to be a pretty lively traveller, something on the order of the chief executive of the U. S. A.—was in another plant, where the general manager is a man of ideas and ability. He is in charge of a comparatively new property, and is marketing a piano that is not nearly so well known as many of its competitors. Consequently he is not overlooking any chances to cut down producing costs, so as to be able to sell his product at a comparatively low price, and also to enable a sufficient margin to be made to provide funds for aggressive sales and advertising efforts.

This plant is equipped with a lot of modern devices which are particularly advantageous in saving labor. All holes are bored by electrically operated drills, screws being driven in the same manner. As there is a lot of work of this kind on a piano, the factory turns out its quota with a much smaller number of men than is required to manufacture the same quantity of goods in the other factory.

It so happens that these two plants are connected financially, the same interest controlling the stock of both concerns. It was in this connection that the head of the older house, whose ideas on the subject were referred to above, visited the veneer plant, which is run by the young, aggressive manager who likes to save money where he can by the adoption of better methods and the elimination of needless labor.

He looked over the equipment and watched the men boring holes and driving screws rapidly and efficiently with the aid of electrically driven appliances. He seemed interested, but not particularly impressed, although in his own plant those operations are being done by hand, just as they were done when the first piano built in the factory was turned out.

Finally he said, in an effort to show proper appreciation, "Oh, that's all very well for you; but of course we don't need to do that in our plant."

Do you get it?

What the piano man meant was that his margin of profit on his well-known, well-liked instrument, backed by the accumulated goodwill of several generations of use was so great that it was not necessary or even desirable that such picayunish economies as saving a few dollars per instrument in the matter of labor be striven for. Probably, if he had elucidated the idea, he would have taken the ground that it would be undignified to go to all that trouble in the case of his beloved product, and that the factory which was compelled to descend so far from artistic ideals evidently had little to offer in the way of a musical instrument that would appeal to the souls of real lovers of art.

That, of course, made it plain why he did not care to have any panel work done on the outside, even though to do so would result in getting better work and in saving some money. He really preferred to do the work by the most laborious process imaginable, as though this adherence to the standards of those who had started the business necessarily meant that the quality which they had put into the piano would be manifest. Such reasoning, of course, does not stand analysis, but it exists in spite of its lack of logic, because those who believe in such ideas have back of them years of unbroken success and financial prosperity. Their answer is irrefutable, for it is based on a plethoric bank account which has resulted from their methods of operating the business.

However, to hark back to the factory where the new idea is not rejected merely because it happens to be new, the general manager is buying some glued-up work and is pleased with it. Close calculation has shown that he will be able to increase his output, with the same investment, to a considerable extent by buying more of his veneered work from those who devote their time and energy to its production. Therefore, it is safe to assume that he will continue to increase his purchases from the panel man who has been serving him, and will ultimately have most of his work of that character produced outside his own factory.

But the other man—no chance. He'll go on using up as much time as possible, just as long as the public will continue to pay the fat prices he charges them for it. It has quality and class, without question; but not because of the antiquated methods which are used in its manufacture.—Hardwood Record.

Will Study Wood-working Industry

In the course of a few weeks thes Forestry Branch of the Department of the Interior will conduct a study of the wood-working industries of the Maritime Provinces, in which all manufacturers of wood products will be asked to co-operate.

It is intended that the investigation shall cover merely that field of products which undergo no further change after leaving the factory. Hence lumber manufacturers will not be included.

Blank forms will be sent out which, when filled in and returned to the Department, will be carefully compiled with a view to giving the public an accurate idea of the extent and nature of the wood-using industries of the eastern provinces. Further, it is not unlikely that, taken in connection with the researches which the experts of the Department are making, some savings can be effected in the choice and methods of utilization of several of the less costly species of wood.

Placing Pulleys for Quarter-turn Belts

I have just had a long argument with a filer who was also much of a millwright, according to his own statements. The question was over the placing of pulleys for the quarter-turn belts in the mill. We have quite a number of them.

His claim was that the center of the driving pulley should be

directly over the center of the driven pulley, on the theory that the belt would follow the center of the pulley.

My plan is to place the pulleys so that the face of the driver is in line with the near edge of the driven, in which position the driven pulley is the full width of the belt in advance of the face of the driver. The driven pulley is placed in the same delative position to the driver, as the belt, in making the quarter-turn, advances its full width, and does not draw under the line of the face of the driver in making the turn.

As I had all the belts in the mill to place, I put the pulleys on according to this scheme, and let him try his plan on the one quarter-turn belt he had in the file room. All of my belts tracked right. The one he put on ran promptly off the edge of the pulley as soon as he started up.

Placing these quarter-turns is a simple affair if the rule is followed as here laid down, but if you try the rule of centers you are sure to have some moving to do before the belts will track to their proper positions.—A. H. H., in Wood Craft.

Care of the Band Resawing Machine

By Hapsburg Liebe

The care of the band resawing machine is the life of the band resawing machine—as well as a great part of its success. No matter what make or style, or size of machine one is using, if the shafts, the guides or the rolls are not in line, one cannot reasonably expect good work. Each of the little properties contribute a certain quota toward the sawing, and none of them should be overlooked.

The dust from the resaw is necessarily fine, and therefore prone to fly in the air; and the result is that the working parts of the machine are easily and quickly clogged, even when the machine has the very minimum of complication in its parts. If the oil-holes become filled, naturally the bearings suffer in consequence; there is a laziness about the adjustments, a stiffness, for lack of proper care in the lubrication. Which is to say that the machine should not be permitted to don a permanent garment of dust.

How many operators, after having levelled the lower shaft and placed the upper in line with it, line up the guide with the saw? If the guide was at a proper place before, it cannot be right after moving the position of the upper or lower wheel. The result will be that the guide bears hard on one side of the blade when it is up and the opposite when it is down. This will account for the tendency of many machines to saw the upper edge of a wide board to one side of the middle. And in lining up the guide, it should be remembered, it is the slide upon which the guide arm runs that should have attention. This is a thing that has caused heaps of bad swearwords to be directed at a poor dumb assemblage of good iron and steel that was entirely innocent of any blame.

That the machine proper should be set level and on a perfectly solid foundation is a thing that will bear the saying over and over. The lower shaft should be level, too, of course. And it should be watched; if the pull of the belt is upward, this, together with the strain of the saw, will tend to wear the bearings fast, and thus put the shaft out of level sooner than most operators would think. This is the cause of the saw's tendency to gradually run out farther off the edge of the lower than the upper wheel, a condition that has now and then puzzled inexperienced men. A saw running on wheels so out of alignment will be somewhat looser on the front, and therefore capable of taking less feed than it should take. Keep the lower shaft level; keep the upper shaft in line with it and tilt to suit the crown of the saw.

Certain types of wheels will catch dust, which becomes caked with oil, sufficiently to throw the wheel out of balance. If it is the upper wheel, the regular jump of the tension lever will cause a jar of both floor and machine, the lower wheel being more rigid and closer confined. This is very hard on both machine and saw, causing vibration, and often cracks, in the latter.

The feeding of the band resawing machine is a matter of no small importance. The feeder may cause the condition known commonly as bull-heading on the front end of the board, and it is more apt to occur on a good machine than a poor one. To explain this; If there is a few seconds of time between the going of one board and the coming of another, the saw, being relieved of the cutting strain, relaxes, and while the tension lever is swinging as the result of the sudden relaxation the strain is unsettled and insufficient at the time the front end of the next board meets the saw. While the saw is weakened it may dodge slightly before it finds its place. The more sensitive the straining device, the easier it will be for the lever to bob. Which is to say that boards going through the band resaw should go with ends touching, else there should be more than a few seconds between them; I advocate the former, which must keep a regular and constant strain, in effect that of one endless board.

One great trouble with the band resaw, especially in resinous woods, is the readiness with which dust collects on the faces of the wheels, a condition that works havoc with the best machine and the best of saw-fitting. I have seen, in extreme cases, so much gum pasted to the wheels that the blade was actually crowded against the outside guides. The greater percentage of this foreign substance being on the front edge, of course the saw was turned out of line with the rolls. Taboo the old remedy of a stiff brush; apply scrapers of your own devising, and touch the wheels now and then with a swab dipped in kerosene. Band-saw plate makes a good scraper, with the temper taken out. Arrange it so that it bears lightly but firmly and from a sharp slant. When the edge of the scraper has worn down to fit the wheel face, it will keep itself sharpened, and rarely fail to keep away all gum, with the assistance of a little kerosene.

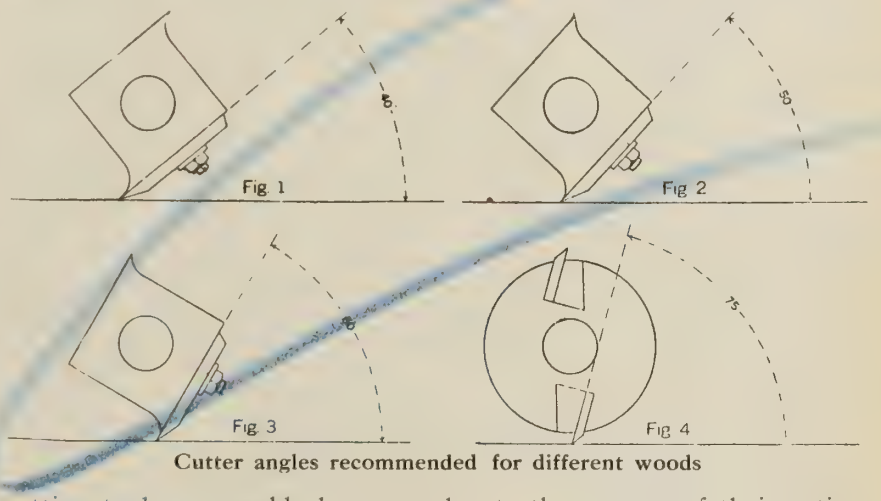
Too much strain is an evil that leads to a multitude of troubles. It will heat the bearings in most cases; it will tend to crack the saws; it will keep the tension pulled out. Steel is elastic, and if the blade is under a strain so heavy that the central part of the blade is tight, then the purpose of tension is defeated by tension itself.

If buyers of band resawing machines would only pause to sum up and investigate the features of them, there would be less kicking afterward. Two-thirds of the machines in use to-day carry saws several feet too long for the work in hand, notwithstanding the fact that the shorter the saw the more taut it will be and therefore, the more capable of taking a great feed—to say nothing of the needless length of blade to buy and care for. There are other machines whose feeding apparatus is complicated and apt to stick. Still other machines have tension arrangements that are little short of the jack-screw order. Add to simplicity, shortness and solidity a sensitive tension device, and you have a real, man's size machine.—Berlin Quality.

Angles of Woodworking Machine Cutters

By A. B. Riley

The views given out on this subject and the examples shown are not based upon theoretical inference so much as upon practical experiments. There are some very obscure conditions connected with the action of wood-cutters. If they moved as slowly as metal-cutting tools, we could observe and note the process of their action, but when in motion they are practically invisible, and nothing can be determined except by comparative experiments.



Cutter angles recommended for different woods

The object among woodworkers seems to be to get as low or acute an angle as possible, regardless of the particular uses to which they are applied, then to prevent slivering, or pulling out the wood, by means of caps. There are, of course, exceptions to the rule, especially with small cutter-heads, as in the case of shaping machines, but exceptions are generally necessary from the construction of the cutter-head rather than the result of any plans that have reference to the work.

It is best not to employ caps on the knives of power machines; they are expensive, inefficient to perform the intended purpose, and are unnecessary if proper attention is paid to the angle of the knives. Any kind of wood, including boxwood, rosewood, softwood or greenwood of all descriptions, can be worked without caps, or chipbreakers, as they are sometimes called, by giving the edges a proper angle and attending to other conditions to be noted.

In planing veneers by hand it has long been demonstrated that the plane iron requires a much lighter angle than for other work. It is also known that scraping tools with blunt edges are the only tools that can be used in turning hardwoods or ivory. In fact, with all hand tools the principle of varying angles adapted to the work seems to be well known and generally applied, but when we come to power tools, planing and moulding machines are made with their knives at a constant angle, usually as acute as possible.

In determining the angle of cutters the following propositions are laid down:—First, in cutting clean pine for surfacing, matching or moulding, the angle of the cutters can be as low as practicable to clear the holding bolts. Second, an acute angle requires a thin

edge, and a thin edge cannot at the same time be a hard one, nor, for that reason, a sharp one, except in working soft, clean lumber. Third, an edge may be hard, and kept sharp, as the angle is obtuse and the bevel short. Fourth, in cutting thin shavings the operation is altogether cross-cutting, and a sharp edge is more important than a thin one. Fifth, as the angle of cutters becomes more obtuse, the shape of the edge approaches nearer to having the same profile as the work, and the cutters for moulded forms are cheaper and more easily made and kept in order.

From these propositions we can take the following rules, which are recommended to those who have occasion to determine the angle and bevel of wood-cutters:—For planing softwood the angle of Fig. 1, of 40 deg., is suitable. For mixed work, partly soft and partly hard wood, the angle at Fig. 2 is preferable; it seems the result is not very good with hard and soft wood. For working hardwood alone, such as oak, birch, ash, walnut or cherry, the angle Fig. 3 is best. For the hardest varieties, such as boxwood, rosewood, banyan, cocoa and ebony, working crotch or cross-grained wood, or at an angle against the grain, the cutters should be set as in Fig. 4.

It is becoming of late years a common thing to grind a short bevel on the under side of knives for working hard or cross-grained stock, which is substantially the same thing as changing the angle of the cutters and making the bevel shorter. It is an excellent plan, as it would be impossible to change the cylinders when the machine has a variety of work to do, but by having some extra knives ground at different bevels it becomes an easy matter to change them. This will pay well for the trouble, especially if the knives are tempered harder as the bevel becomes more obtuse.

It will be found in practice that a set of knives, hardened to a very pale-straw color, and with bevel ground on the face side (just enough to keep the edge from breaking out), will run long and do smooth work on walnut, birch, ash or oak, and will not pull out the stuff where it is knotty or cross-grained.

It has also become a common practice in some parts of the country to turn the matcher cutters of flooring machines upside down —that is, to turn the grinding bevel to the wood. This is an effort in the same direction—a slow change from the necessities of practice instead of from inference, as it might be. This way of getting an obtuse angle is going a little farther than is recommended here, but to divide the bevels by grinding on both sides will be found an advantage in matching hardwood, including yellow pine.

The plan is an old one. The Knowles matching heads, introduced about 1850, had this feature fully carried out by having the bevel on the inside of the cutters. They were always considered as being capable of working any kind of lumber without tearing, and without clips or pressure pads, yet for some reason the plan was not carried out in common practice, probably from being too expensive.

We will notice one more fact bearing on this matter, that of machines for making wave mouldings. Such mouldings are cut smooth and in part at an acute angle against the grain, and still are not torn or spoiled in working. The whole secret of their manufacture, often a matter of curiosity, is nothing more than to set the cutters at right angles to the face of the moulding. The feed movement is given to the wood and the reciprocating motion to the cutters, which act as scrapers.—The Woodworker.

Specific vs. General Quotations

A furniture manufacturer was laughingly discussing the letters which he receives from lumbermen who have stock to offer.

"They are all so nearly alike," he said, "that unless I pay close attention to the letter-heads and the signatures, I am likely to assume that they are all from the same person.

"I am constantly informed that lumber is being offered which consists of dry stock of good lengths and widths, and that the grades are all right. Inasmuch as everybody tells me this, how am I to determine which is the best lumber? As a matter of fact I am not able to do so, and a letter of this kind doesn't interest me at all. I am looking for specific facts, not generalities, and there is no reason why I should buy lumber without knowing what the description of the stock being offered me is than I should order a suit of clothes without examining the pattern or finding out something about the design which is to be used in making up the suit."

The art of letter writing used to consist of the ability to string pretty phrases together, and make a dissentation on the weather or the condition of the spring crops sound like one of Lamb's essays. Letters in the good old days were not supposed to sell goods. Now, however, the letter-writer who commands the most praise—and salary—must be more than an artful composer. He must not only be able to use words to the best advantage, but must weave enough facts into his epistles to enable the man at the other end of the line to visualize the goods which he is offering.

These are at least the principles which apply to letter-writing when selling every other class of goods in the country, and there is no good reason why they should not be true of lumber. Lumber is frequently sold by mail to consumers, at the expense of the retail dealer, who wonders how it is done and insists that it is because of some slight-of-hand or underground methods which will not stand the light of day. Probably, however, mail-order concerns which flourish on their lumber trade manage to sell because they are able to dsecribe their goods as attractively as though they talking about grand pianos, books or motor-boats, and consequently get the interest and attention of the man who is in the market for lumber. The yardman in the town of the consumer can't tell his prospect much about the stock, except that he will agree to deliver so many thousand feet of a certain grade. Naturally the better description wins, even though it is a long-distance effort, prices and other factors being equal.

A lumber salesman, working on commission for a sawmill down South, used to get in touch with possible customers in the market where he was located over the telephone. There may have been occasions when he varied his methods of offering stock, but they were not many. Usually his appeal for business was something like this:

"I've got a mighty fine car of plain oak ready for shipment, and if you can use it, I'll make the price right. It's dry as a bone, and has good, wide stock in it. This is good stuff," etc., etc.

The fault of the solicitation was that the salesman did not know anything about the lumber he was trying to sell. Consequently he was not able to give the customer a particularly clear impression of it, except that it was lumber of a certain kind and grade. Besides, the temptation was constantly present to very the description to suit the needs of the consumer, and if the latter wanted a certain percentage of long stock, or required the lumber to be six or eight months from the saw, he immediately gave assurances that such was the case. Then, if he had quoted a low enough price, the order was sent in, and probably he had to settle a kick a little later in case the description of the lumber delivered failed to tally exactly with that which he had given verbally. That there should be a coincidence in these descriptions would be a coincidence of circumstances and not the result of premeditation.

Many lumbermen argue that it is impossible to describe lumber exactly, and that the salesman who tried to describe the stock he was selling, as far as lengths, widths and age are concerned, would not only attempt the impossible, but would embarrass his employer. They take the ground that in most cases the information is not at hand, especially if a wholesale business is being done and lumber is coming in from a large number of mills and moving out in quantity every day. They state further that it is not practicable to try to give data which can only be secured by an extremely laborious compilation of facts from the tally-sheets.

It may be that this is the case; yet, with the point so clear that lack of identity is what hampers lumber, sales, and that giving offerings of lumber individuality by descriptions based on the actual qualifications of the stock would help to move it in cases where ordinary methods fail to get results, there seems to be room for the operator who will go to the trouble of digging up those facts and supplying them to his salesmen so that they in turn can offer their customers not merely lumber, but certain lumber.

The average buyer is not in the market for merely lumber. He has certain definite needs, and unless he is making a wide variety of goods and therefore requiring numerous dimensions, he prefers to have his stock run according to given widths and lengths, just as he wants it to run according to agreed grades and thicknesses. If one lumberman agrees to deliver a car of lumber containing thirty per cent. of 12-foot boards, and twenty-five per cent. 10 inches or over in width, whereas another offering has no statement as to the percentage of wide and long stock, it is a practical certainty that if his requirements run in that direction, the purchaser will buy the first named car.

A prominent hardwood man said: "I have got expressions from customers which prove to me that the biggest mistake made is to write a letter which is intended to sell lumber, and then fill it with stock phrases, general statements and improbable claims as to the character of the stock, when you know that the prospective buyer is trying to find out the exact description of the lumber. If I can't tell all about it, I tell as much as I know; and that goes a long way in getting the attention of the buyer, who is likely, otherwise, to toss your carefully framed epistle into the wastebasket with no more compunction that you would a circular from a concern that is trying to sell you a piece of machinery without telling you what it will do, how much it will cost or why you should install it in your mill."

Another consideration in this connection is that the efficiency of salesmen can be greatly increased if sales letters are properly used. Most of the time the travelling man solicits customers without knowing whether or not they are in the market or are likely to be. He simply "makes the rounds" and picks up whatever inquiries he happens to run across. His calls are limited in number, of course, and

inasmuch as a large proportion of those seen are not buying, the number of people solicited who are actually ready to purchase is extremely small.

If selling efforts were extended in the direction of letters telling what the firm had to offer, and advising that if the customer were interested a salesman would call with a complete description of the lumber, it is probable that the elusive inquiry could be cornered and the time of the salesman put into much better advantage than under present conditions, with the latter "shooting at the moon" most of the time in his quest for business.

It would mean a little more careful cultivation and a little more intensive effort, but according to the scientific farmers that is the kind of system which makes crops increase.—Hardwood Record.

Good and Bad Saw Mill Plants

By E. M. L. in the Wood-Worker

Among the many sawmill plants that I have seen, and at a few of which I have had the honor of holding positions, I have met with some of the poorest arranged plants imaginable, as well as a few that were so arranged that everything was handy and convenient. To illustrate more fully just what I am trying to tell, I have drawn Figs. 1 and 2.

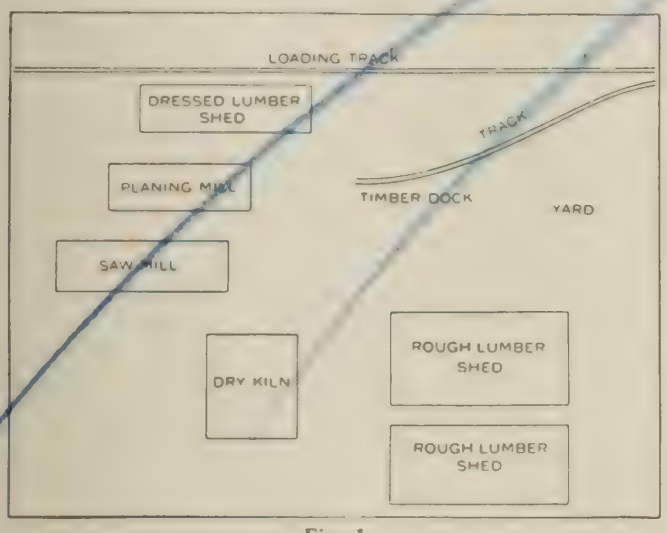


Fig. 1

The plant that I consider a perfect model of inconvenience and left-handedness was located in Louisiana, but was burned down a few years ago, so it matters not just where it was located. However, it was an eyesore to me for nearly six years, as I had charge of the shipping department and so came in close touch with every bad feature. Fig. 1 gives an idea of the general arrangement of sawmill, planer, dry kilns and sheds. In Fig. 2 will be seen a much better arrangement and similar to a few plants I know of.

It will be noticed that with the plant arranged like Fig. 1 the lumber gets farther away all the time from the planing mill, making

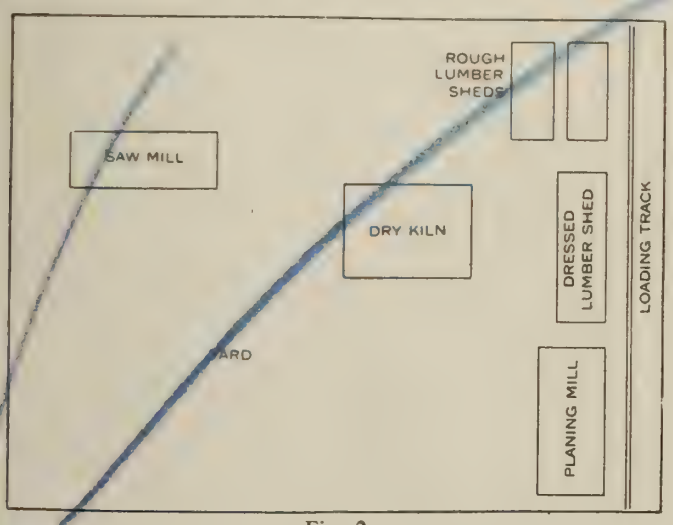

Fig. 2

it harder to log the planer—in fact, increasing the expense of handling to the planer. With a mill plant like Fig. 2 the lumber starts toward the planer and loading track from the sawmill, making a short haul, quick delivery and economical handling from sawmill to car.

And not only can one notice this bad arrangement in the general plant, but it is very frequently seen in the installing of the machinery in both saw and planing mills. I have one mill in mind that was first planned for a single band, then a resaw was added later on. This, of course, jumbled up things some; then, a little later, a "Dixie" circular was added on towards the back end of mill. This made the band a right-hand and the circular a left-hand, causing a congested condition a good deal of the time in getting the lumber across to the edger. It cost about double to manufacture lumber under such conditions. My experience has been that the least machinery one can get along with, and have it labor-saving, the more economical it will be.

Speaking of saw-milling in general, I have observed that not every plant is managed with the skill that is acquired from an intimate and personal contact with the work in hand. The best superintendents and managers are those who know from actual experience all along the line, from stump to consumer. A case in point: A company had a filer for three years, and thought he was a crackerjack until he quit and a new filer came. When the new man got things lined up, the saws quit cracking and making snakey lumber, the cut increased, and the load was taken off the engine because the saws had more hook and throat put in them.

It seems to me the best way for holders of large tracts of timber, who are figuring to manufacture same, to escape having an ill-arranged plant, is not to put in as manager a man with no qualifications as a lumberman or any idea of convenience, but simply because he has a pull or is a relative. I have known these reasons to hatch out just the money-losers I have illustrated.

Then, again, I have seen a few plants that had insufficient boiler capacity, or else the boiler settings were defective. One plant, where three large boilers were installed, had about 100 horse power over the engine capacity, but could not hold steam. For a year it went on that way, till finally the engineer persuaded the manager to let him raise the grates about a foot and slope back the bridgewall, which was about 2 ft. perpendicular from the grates. This allowed a draft to pass over the fire and took away the dead-air chamber at the bridgewalls. Then there was no more trouble about steam.

Another plant has three boilers and one smokestack. They use hollow-blast grates, and at times it almost smokes the fireman out, there is so much back-draft through the doors. There has been the price of several smokestacks lost by shutting down for steam.

It certainly takes a broad-minded man to fill the manager's position, and be able to meet the many problems in mechanics, manufacturing, and to know when he has the right man in charge of a department.

Important Points for Sawmill Managers

Lake Jolly, N.S.

Editor Canada Lumberman:

After reading the article entitled "Leaks in the Sawmill" in the Canada Lumberman of June 1st I felt that the writer had pointed out many of the most serious difficulties in the running of a sawmill. May I be allowed to express some of my own ideas on a few of the important points to be watched?

It is easy to imagine that we can make money with a sawmill if we go in and see a mill cutting lumber. We can find how much it is putting out each day, count the men employed, make a guess at the amount of wages and the supposed amount of other expenses, strike off the total from the daily earning and find just what we are looking for, a good day's pay. If we ran a mill for a short time we would perhaps be able to save some money. My own experience has been to find so many ways for money to escape, and what might be called small strings pulling back, that we must be careful to look for every possible means of effecting a saving and to make the best of all opportunities.

In the first place get a good outfit; the boiler or boilers from the best builders, and know that they are easy to fire and good to steam, with ample heating surface. Have the connection to the engine as short as possible and well put together.

See that the engine is calculated with surplus power as the load is ever increasing. The frame should be well proportioned and strong, the working parts of good metal and what you would call heavy. Have the bearings long and a good oiling device. The belts must be strong enough to not pull out till they are no good. My choice is Balata as it is tight and strong. Get a good mill with each piece well put in and be sure that it will run cool. See that it is straight so that the belts will not hang on one side, or run off.

Have a good man to keep things in order, a sawyer who will keep the saw cutting, and place the log to get the most out of it with the least cuts, or the least number of boards. Then the edger man and trimmer must not waste. The yard man must not leave the lumber to spoil or be broken by teams.

Save all that is sawed. The poor stock will be worth something. Put it on the market in the best possible shape. If the business pays too well give the help a bit more. T.H.W.

According to estimates of the Northern Pine Manufacturers' Association, the timber cut in Minnesota for the year 1912 will total two billion feet. This includes all the hard and soft woods.

CAMP DEPARTMENT

Intelligent Log Purchase

By H. B. Scale*

This subject at the present stage of the veneer business, is one demanding a great deal of thought and careful study. In attempting to treat this subject intelligently I hardly know which is of the most importance, the adoption of a comprehensive, simple cost accounting system, or the intelligent purchase of our raw material, for by the use of a good cost accounting system I believe all veneer manufacturers would soon revert to more careful purchase of the raw material.

It seems to me the vital point in our purchase of raw material, which we should ever have before us, is that our raw material is very unlike that of other businesses, in that it is not being refined or becoming better by careful processes of cultivation or manufacture, but on the contrary is becoming poorer by a gradual reduction of our forest area. We are all no doubt going back to timber tracts and taking trees that we would have left for firewood five, ten or twenty years ago. The result is that either our percentage of flitches or veneer wood from logs, on the average, is decreasing very rapidly, or the quality of our product is decreasing. This not only applies to quartered white oak but to all of our domestic hardwoods. White oak trees suitable for veneer purposes are, generally speaking, a very small percentage of our native forest growth, and as the forests become less dense, the quality will necessarily become less suitable, in accordance with the standard of quality of the present time. The rate of growth of a tree in an open stand is more rapid diametrically than in a close stand and the tree is more apt to be limby. It is, hence, less desirable.

With these few points before us, and the very important point of the difficulty of raising prices on our veneer staring us in the face, would it not be well for every manufacturer of veneer to base well his standard of value when working up the timber buyer's estimate for a price on trees? We all know by long bitter years of experience that logs above the first or second cut of a tree, depending, of course, on the length and size of the tree, density of the forest, etc., are not as valuable as the wood closer to the ground, and though they may be smooth bodied are nevertheless defective. Therefore the price on the upper cuts should not be that of the butt or second cuts, for they are nothing other than lumber logs, and their product will bring only lumber prices. We are all familiar with our cost of manufacture, but how many of us know just what the cost of our raw material is, when it is ready to cut into veneer? I refer now primarily to those of us who manufacture from the trees. For those reasons a standard base price for the different cuts of the tree, established by the experience we have had in the past, will go a long way toward eliminating vicious competition for timber.

Recently I had an experience that you all no doubt have had many times, which impressed me very deeply. The wood was white oak. The trees were estimated by several timber buyers to have 105,000 feet of good logs running from 20 to 40 inches, mostly 24 to 30, for which the party who purchased them paid $8,000, which price the party who sold them admitted to one of our timber buyers was $1,000 higher than the next highest bidder, and a man who had offered $7,000 had a mill within ten or fifteen miles of the trees, whereas the purchaser was said to be a Chicago veneer man who was to ship the logs to a sawmill, then reship the flitches to his veneer factory. For my part I can't see how he can do anything but lose money on that deal, and even should he get his money back, would he have paid that amount of money for that little bunch of timber if he had based his price on experience?

The day of guessing what the other fellow is going to bid and then adding a liberal amount so as to be sure to be above the other fellow, should be banished into the past.

In the matter of flitches, we have eliminated the vast source of chance from our buying to a large extent, and we are not so near to buying a "pig in a poke." The quality, texture of wood and figure are largely laid bare for our inspection, but here, too, an intelligent basis will help to make our business profitable. I am of the opinion that the best basis for prices on flitches is that fixed by actual width and not that based on averages. By this I mean so much for each width or range of widths, such as 6 to 7½, 8 to 9½, 10 to 11½, etc., depending on the prices we can obtain for our product.

I said at the beginning of this paper that business is good, but shall not we all now profit by former experiences? For instance, the demand for poplar panels some two or three years ago by the automobile trade, of which wood this trade uses very little to-day, advanced the price of poplar in the tree from a reasonably moderate price to an abnormal price which has not decreased since to anything like what it should have, price of veneers and lumber of that wood taken into account. We should not allow the farmer, who is without organization or even a price list, to force us to butt our heads against one another and pay him prices for timber that neither the price of our product nor necessity demands.

*Paper read before the National Veneer and Panel Manufacturers' Association.

Sanitation in Camps

By W. R. Hume

It is most gratifying to notice the increased interest that the subject of sanitation is receiving and has received of late, especially as adapted to communities which must work out their own rules of healthful living. In most villages, towns and cities, there are established boards of health who either give their time or are compensated for it and whose duties are to make regulations and see to the enforcement of them, to the end that these communities shall be protected against the ravages of disease or to take means to control it should it once gain a foothold. Of these health officials much is expected and demanded for they are men who have been scientifically trained along the line of prevention and control of disease. But when we come to handling the camp situation we find a different set of conditions. One would hardly expect to go out in the woods in a logging camp and find laboratories fitted up and equipped for work which comes under the head of medical science; nor would it be practical to establish such an institution, for the rules of sanitation have been well worked out, and if the desire on the part of those in control is to apply them, the only thing necessary to do is to point out the way in which they may be applied economically and efficiently.

This subject deals with the laws of health and the rules for hygienic living and is worthy of the deepest consideration from both an economic and humanitarian standpoint; and efficient action upon the principles involved means much to both employer and employee in health and comfort.

It is well known that many of the diseases ordinarily encountered, and especially those which might be a source of danger to a community living as people must in camps, are produced by minute organisms of microscopic dimensions which are capable of being transferred from one person to another and producing the same condition in the one to whom it is transferred as in the one from whom it came. These small organisms multiply with remarkable rapidity and in a very short time a large number of persons may become infected from the one source. And so it is that these organisms become potent factors in the life and health of communities, be they large or small.

Knowing then, that we are in constant danger of being invaded by these bacteria through the medium of air, water supply, personal contact, and by insects of different kinds, the essential thing to know is the most effective way to prevent this threatened invasion either of our persons or our communities. To this end much attention has been paid by investigators and carefully made rules laid down, with the result that sickness has decreased materially in places where large bodies of men are quartered together, especially in the army; and when disease in epidemic form threatens, it is controlled rapidly and effectively. As applied to camps these rules differ but little from those as applied to villages, towns, or cities. There are certain fundamental principles involved that apply the world over, and if carefully observed and strictly enforced, make for healthy communities.

Camp Site

Be careful of your selection of the camp site. It should not be located on a spot that has been recently used for the same purpose. The site should also be frequently changed; in order to avoid the effects of soil pollution which might result from long continued occupation. The site should be selected with reference to several important particulars. The soil of the locality should be dry, sandy in character, and well drained. The soil should also be so located as to afford a plentiful supply of pure and wholesome water. Too much stress cannot be laid on this point. Low-lying, damp, or marshy localities should be avoided for obvious reasons.

The Camp

The camp should be as compact as will be permissible with health and cleanliness. When tents are used, a trench at least 2½ inches in depth should be dug around each tent to exclude surface water; and this should lead, with the trenches from other tents, into a larger one so as to conduct the rain water from the

camp ground. The camp should be laid out in streets and these should be cleaned regularly every day and all rubbish burned as promptly as possible. All kitchen refuse should be collected twice a day and removed from the camp-grounds or buried in trenches dug for the purpose. The tents or houses should be aired every day, and all bedding should likewise be exposed to the air every day unless the weather prevents.

Water Supply

There should be an abundant supply of pure water for all purposes for which it is needed. When the wholesomeness of the water is doubtful, some means of purification should be provided. For this the Forbes portable water sterilizer is now much used. This apparatus is in common use in army camps in the tropics, and good reports are made in regard to its efficiency in preventing the development of typhoid fever and diarrhoea diseases. Provision should be made of ample opportunities for bathing. In the absence of bodies of water large enough for swimming, shower baths at least should be supplied. Keeping the body clean is one of the greatest factors in the prevention of disease and the preservation of health.

Latrines

The latrines should be situated at least from four to six hundred feet to the leeward of the camp and not near the source of the water supply. A deep and narrow trench should be dug for the purpose. It must not be too wide or it will require more earth to cover the excreta. At least three times a day the excreta should be covered to a depth of from six to nine inches with earth or slaked lime. The dry earth readily absorbs the putrifying material and thus renders it inoffensive. This will also protect it from flies and insects, and limit one source of general infection should there be unrecognized cases of typhoid fever in the camp. The excreta of all cases of typhoid fever and dysentery should be disinfected at once, and should never be thrown into the trenches without this precaution. The excreta in the trench may also be burned daily by pouring kerosene upon them and igniting it. New trenches should be dug when the old ones are filled to within eighteen inches of the top, the old ones being completely filled with earth. The latrines should not be near the kitchen or mess-room, nor near the sleeping quarters.

Sleeping Quarters

Besides healthful sites, the essential conditions of sleeping quarters are dryness, warmth, light, amount of floor space, and air supply. Each man should have at least 100 cubic feet of air space and 12 square feet of floor space. There should be more space allowed if the quarters are constantly occupied. This, of course, refers to quarters where many are living together, as in bunk houses.

Ventilation

In frame quarters, ridge ventilation is entirely satisfactory, or it may be accomplished by means of double inlet and outlet tubes in the roof, so constructed that the fresh air enters through the outer tube and the vitiated tube takes its exit through the inner tube. When an epidemic of tonsilitis occurs in camp, deficient ventilation may be suspected, and the accumulation of infective dust, along with vitiated air is frequently the cause of tuberculosis and pneumonia.

Flies and Mosquitos

Since flies and mosquitos are frequent carriers of disease, they should be rigidly excluded from the quarters. They light upon all kinds of filth, and in this manner their bodies become infected and they no doubt carry the bacteria from place to place and contaminate whatever they light upon. During the summer months, therefore, all the doors and windows should be provided with screens or mosquito bars to exclude them.

This briefly covers the conditions necessary to obtain the proper sanitary conditions of a camp. They are not difficult to conform to and neither is the matter of expense of any moment. The camp can just as well and as economically be laid out along the right lines in the first place, and great benefit will result to all concerned in more and better work, better health, and a better frame of mind, if the simple rules of hygienic living are understood and applied.

Snubbing Logs With Air

By Henry A. Kalb*

Handling logs in steep chutes has always been very difficult to do without splitting and it is something that we can't get away from when logging in rough ground without going to a large expense to build railroads and get a good grade to the top of the hills; but in some cases it is even impossible to build railroads, so there is nothing to do but put in the common three-pole chute and keep control of the logs as much as possible.

Of course, there are some places that the logs can be made to chute into a pond. This will work out all right, but the places where you can have enough water for a pond are very few compared to the number of localities where it would be impossible to have a pond to chute into.

In our case the ground has been very rough and it was necessary to build chutes to get our timber from some of the hills. It was impossible for us to build our railroad to the timber. In some cases the railways had to be built right at the bottom of the chute. This, however, was very bad, especially during the wet season. Logs frequently would get away and beyond control, smashing into one another, splitting them up very badly. We have lost thousands of dollars' worth of some of our best timber in this way—splitting it at the bottom of a chute, and there was absolutely no way to avoid it. I think probably that there are a good many loggers here who have experienced the same trouble.

We are now using at the Quinault Camp an Air Snubbing Machine, built by the Smith & Watson Iron Works of Portland, Oregon, snubbing logs in a three-pole chute on a 30 per cent. grade, about 2,000 feet long, which is working entirely satisfactory, and we feel that our troubles from this source are at an end.

This machine is set at the top of the chute and acts as a headblock for the road engine as well as a snubber. There are a great many advantages connected with this machine. First, the proper place to snub the logs is from the top of the chute. Second, you only have the one main line in the chute, which is of great advantage. No doubt a great many of the loggers here have tried to use the old brake snubber, which adds another line in the chute with the trip line. These lines twist together and cause lots of trouble, increasing cable expense.

With this new Air Snubber, we can snub logs down almost any grade and have absolute control of the turn of logs at all times. The machine has a governor which controls the speed of the logs and it is impossible for them to get beyond the speed desired.

This all works automatically, requiring no attention at all. While the main line of the road engine is being tripped back, the pawls release automatically which allows the drum to rotate freely, acting only as a headblock.

Another important feature of this Air Snubber is that in a good many cases during the real dry weather the logs do not run at all in some chutes. In this case, the pawls are set so as to allow the drum to rotate freely all the time, acting as a headblock; but in case it should rain enough to cause the logs to run, you have your machine right there to act as a snubber. We have also used this machine for snubbing cars down some very steep grades, which worked entirely satisfactory.

Long stretches of expensive railroad building can be avoided in this manner through using this machine in connection with a chute direct from the top of the hill to the main line of the railroad.

* Paper read before Pacific Logging Congress at Tacoma, Wash.

Electric Power for Log Hauling

By C. O. Cole

With the passing of the "bull team" and the introduction of the steam driven power haul, with the steel rope to span the distance between the load to be moved and the source of power for moving it, came the question of how to apply the power of the engine or prime mover, to the hauling cable. And this problem of applying the power of the prime mover to the hauling cable has never, until the present day, been anywhere near successfully solved. For, notwithstanding the fact that the steam donkeys have been handling thousands of logs during the past twenty years, the difficulties and objectionable features in the application of the power of the prime mover to the hauling cable have remained; and with at least a part of them at all times, the operators have had to contend.

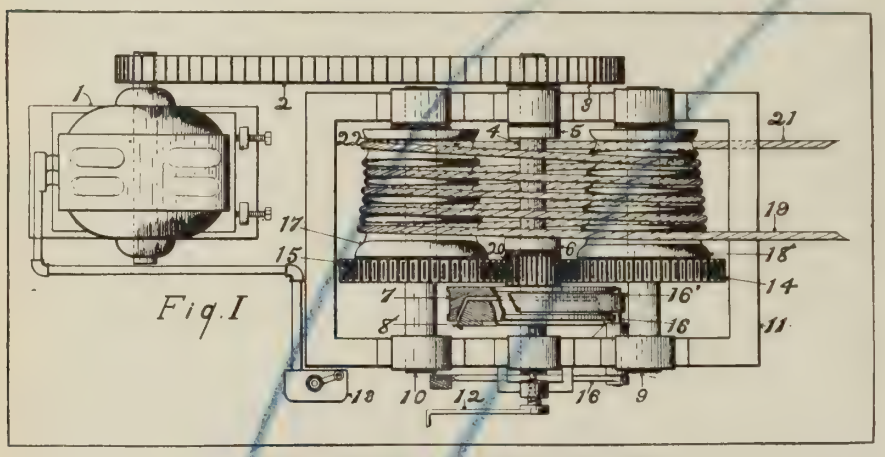
While the early types of steam donkeys, the old Dolbeer vertical spool, with its man spool tender, very desirably allowed the driving engine to be run up to speed and developing its full power when the cable was drawn tight around the spool to start the load, thus making practically the full power of the haul available for starting the load, and while they were able to deliver the power of the engine to the hauling cable at constant leverage throughout its entire length, they were subjected to the very undesirable features of not being able to take care of the cable after having pulled it in, of not being able to pull the cable back into the woods, and of severely wearing the cable as it crowded itself sideways on the spool off the flanges.

With the introduction of the higher power steam engine and the double drum donkey these difficulties mentioned above were overcome; but with their passing came the still very great objectionable features of the cable having to wind in on itself when under full load, the biting into itself causing severe wear, and the reduction of leverage through which the engine must handle the load as the drum fills up with cable and increases in diameter. And while these were very objectionable features they were the only ones which it was possible to contend with and operate extensively at all and in spite of the thousands of dollars that have been spent in the many attempts

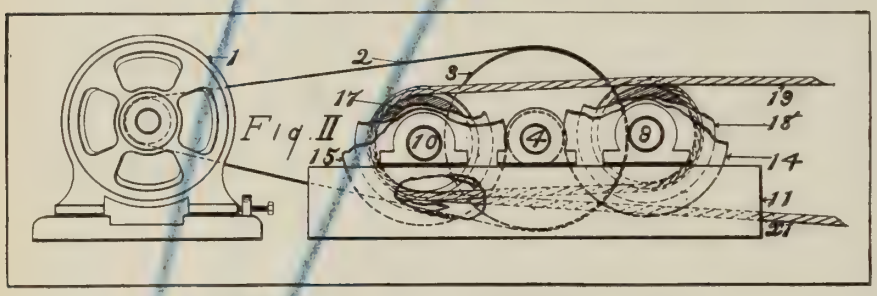
to design and construct a haul which would eliminate them, these objectionable features still remain; so that, several years ago, when the designing engineers commenced to figure on the design for an electrical driven haul for logging purposes, the "variation in leverage," as the drum fills up with cable, was found to be primarily the cause of so many objectionable features in the operations of the common type of motor driven log-hauls as to make their application to logging works impracticable.

However, electricity, instead of not being adapted to logging operations as would seem from the experiments of the past six years, lends itself most admirably to this class of work. And the electric motor when properly constructed presents two available sources of power, in a single prime mover, under such favorable conditions as to make possible a construction which not only makes electricity adapted to logging operations; but in this as in all other classes of work requiring the service of a prime mover, electricity is capable not only of doing the work cheaper, safer, and faster than any other source of power; but it is also capable of furnishing power in such a unique manner as to be able to eliminate the objectionable features in the application of power to a hauling cable that are, and ever have been, so prevalent in the steam driven hauls.

In an article on electric haulage published in the May, 1912, edition of The Timberman, we dealt with this subject, and showed, in



"Canuck" Electric Log Haul (Top View)



"Canuck" Electric Log Haul—(Side View)

the description of the "Chinook" Electric Log-haul, how the attraction and repulsion action between the field and armature of a motor tended to rotate the armature in one direction and the field in the opposite; and that by eliminating the base and legs of a motor and making the field housing cylindrical in shape with hubs extending out from each end to rest in large self-aligning bearings, that the field would rotate in one direction on these hubs at the same time the armature, whose shaft extends out through and is journaled in openings in the field hubs, rotates in the opposite. Thus in a motor constructed in this way there are two rotating elements rotating in opposite directions, constituting two sources of power; one, the inner rotating element driving two simultaneously rotating grooved drums for pulling in the loaded cable, and the other, the outer rotating element driving a common flanged drum for winding up the slack of the cable. And while the forces tending to cause one rotating element to rotate in one direction are acting just as strong on the other rotating element tending to rotate it in the opposite, it will be seen that the gear ratio between each rotating element and the drum it drives, may be made such as to deliver any desired relative amount of pull to the hauling cable at the two points of applying the power. Accordingly in the "Chinook" about thirteen-fourteenths of the power of the motor is applied to the cable at the haul-drums which act as a winch or spool for hauling in the load and about one-fourteenth is applied at the winding-drum which, winding up the cable pulled in by the haul-drums, acts as a perfect mechanical spool tender to them. The cable passing back from the haul-drums to the winding-drum where it is wound up, keeps the winding-drum rotating at the same peripheral speed as the haul-drums; and the gear ratio between each drum and the rotating element driving it, compels each rotating element of the motor to assume the relative number of r.p.m. to keep it in step with the movements of its respective load.

During the past ten years the objectionable features so prevalent in the steam driven haul, the "biting into the turns" as the loaded cable wound in on itself, and the "variation in leverage" as the drum filled up with cable, has inspired many attempts to design and construct steam driven hauls that would eliminate them. Notably among those constructed were the attempts to construct hauls that would operate an endless-cable. And of these there were at least two different kinds that were constructed and tried out in actual working operations. However, the operations of these endless cable hauls were not successful as in each case the machines when put into actual operation created internal strains which wrecked themselves.

In order to show why these machines failed to operate and to show how they may be made to operate with some degree of success, it will be of interest to recall something of their construction.

One of these endless cable hauls which was built and tried out in the vicinity of Bellingham, Wash., consisted of a series of simultaneously driven grooved sheaves of equal diameters arranged one before the other in such a manner as to have the cable take over one and under the next. Thus being adapted to having the cable take sufficient number of turns over these rotating sheaves for their frictional contact with the cable to hold it from slipping when pulling in the load. The slack cable, after passing off the last sheave, passing out through the works, through the required leads, and tail-block, and then returning to the machine; having the load hooked onto it by a cable-grip or "comealong" which was to be removed when the load reached the landing.

This machine, notwithstanding that it had been made with apparently ample strength in all its working parts, created internal strains which pulled itself to pieces.

Another attempt to construct endless cable hauls was made in British Columbia. These machines were quite different from the one just described and consisted of a pair of simultaneously driven grooved cylindrical drums arranged one before the other and adapted to having an endless cable take a sufficient number of turns over their grooved surface to hold the cable from slipping when pulling a load.

There were two of these hauls built and tried out. In one, the first, the haul-drums were mounted on three inch shafts and in the second the haul-drums were mounted on six inch shafts; and when this machine was attached to a donkey engine and hooked onto a load it created internal strains which pulled the drums together with such a force that it bent the six inch shafts on which they were mounted. Thus showing that the machine created more of a pull tending to pull the drums together than it did to pulling in the loaded cable.

The parties who built and tried out these machines seemed at a loss to know just why the machines had put more power to pulling the drums together than they had to pulling in the loaded cable. And simply threw up the attempt, attributing their failure to the cables winding onto the drum in this manner having acted something like a "chain block." However, during the past few months the forces, which acting in these machines, and the manner in which they were applied to put more power to pulling the drums together than was applied to the cable by the haul, to pulling in the load, have been figured out and a very simple remedy for overcoming them has been devised and is herewith described.

In pulling a load with a steel wire cable it is obvious that the heavy strain put on the cable is bound to stretch it to some degree. And also that when the cable is relieved of its load it will tend to shrink with practically the same force that was put on the cable to stretch it. This stretch may be ever so slight. Possibly not over a thirty-second of an inch per foot; but if an eleven ton load pulls a one thirty-second of an inch of stretch into every foot of cable between the load and the haul, this cable will tend to shrink one thirty-second of an inch with a force of eleven tons every time a foot of cable is wound onto the haul-drums and relieved of its load.

It will be recalled that the two gears, driving the two grooved cylindrical haul-drums over which the cable takes its several folds are driven by the same drive pinion so the two half-drums must rotate at the same speed; and therefore, if the first drum, that the loaded cable takes over, tends to wind in 5,236 feet of cable with every revolution of the drums, the second drum the cable takes over will be tending to wind in the same number of feet. Then, if after taking over the first drum, the length of cable, passing from the first drum to the second drum, has been relieved of enough of its load to make it tend to shrink one thirty-second of an inch with a force of one ton, it will be seen that the second drum, in trying to wind on as much cable as the first drum will either have to slip the cable in its groove or be pulled toward the first drum by the first fold of the cable acting in the first groove with a force of one ton trying to move it one thirty-second of an inch; and that every length of cable making a complete fold of the two drums in each succeeding pair of grooves will be pulling the drums together in the same way. However, as each succeeding arc of contact will relieve the cable of proportionately more of its load than the arc preceding it, and as each succeeding arc is trying to wind on more cable than is delivered to it by the arc pre-

ceding it, this shrinking force in each fold of the cable that takes around a pair of grooves is not distributed evenly throughout the length of the fold, but is much greater in one span of the cable passing between the two drums than it is in the other; and acts at practically a double leverage on the drum-shafts, tending to bend them, in the following manner: The lengths of cable, passing from one drum to the other, that have the least tendency to shrink correspond to the "hinge point" of a nut cracker, or the "fulcrum point" of a lever mechanism. Then the radius of the drums, or the distance from the side of the drums between which passes the lengths of cable having the least tendency to shrink to the centre of the drum-shafts corresponds to the "work arm" of the lever. The diameter of the drums, or the distance from the side of the drums between which passes the lengths of the cable having the least tendency to shrink to the opposite side of the drums where the cable has a greater tendency to shrink, corresponds to the "power arm" of the lever. Thus each set of cables passing back and forth between the two sides of the drums constitutes a complete lever couplet with the "power arm" twice as long as the "work arm," and acting on these several "power arms" is the force of the shrinking cable; and this force is repeated with the winding on of every length of stretched cable that is required to make the several folds from where the cable first comes in contact with the drums to where it winds off slack and shrunk to its normal length.

In order to meet the requirements of the shrinking cable as it is wound in and relieved of its load. And in order to construct a haul that would apply the power of rotating drums to an endless cable without creating the internal strains referred to above, there has been designed and we are presenting herewith the "Chinook's" little brother, "The Canuck" endless cable roader, or lowering haul. In this machine the two drums provided for applying the power to the hauling cable, instead of being cylindrical, are grooved conical drums with the drums just enough smaller in diameter at each succeeding groove to allow for the shrinkage of the cable up to where it comes in contact with the drum at that point.

By this arrangement, while the first grooves around which the cable takes, are pulling in the normal length of the cable plus the stretch pulled into it by the load, each succeeding groove being smaller in diameter will be tending to pull in less, and less, length of cable until it has been relieved of its load and is shrunk to its normal length. However, as the amount of stretch pulled into the cable by different loads will vary it will be necessary to make the variation in the diameters of the several grooves sufficient to meet the requirements of the heaviest loads when the cable is stretched to working condition. Then in order to meet conditions when the variation in the diameters of the several grooves exceeds the requirements of the shrinkage of the cable, the last grooves, around which the cable takes, after having been relieved of its load, is provided to be larger in diameter than the ones preceding it. This large groove with its greater diameter will tend to wind more cable onto itself and thence off the drums, than the preceding grooves; and will create a pull on the cable. Thus acting as a spool-tender and keep the cable tight in the preceding grooves, so each succeeding groove in this conical drum construction will assume its proportion of the frictional contact with the cable and deliver its share of the power without creating internal strains in the machine.

The accompanying cut, Fig. 1, shows a top view of the "Canuck," and in this drawing reference numeral 1 indicates a common motor furnishing power to haul through a steel chain drive (2) which takes over a gear (3) on the drive-shaft (4). Numerals 7 and 8 are respectively the loose and tight members of the friction clutch with the member (8) splined to the shaft (4) and provided, when brought into frictional contact therewith, to drive the loose member (7) which is fastened to the pinion (20). Nos. 9 and 10 are the haul-drum shafts. No. 11 is the haul frame. No. 12 is the lever controlling the friction (7 and 8). No. 13 is the electric circuit controller. Nos. 14 and 15 are the main gear on the drum-shafts. These gears are keyed to their shafts and engaging the pinion (20) receive power therefrom for driving the conical haul-drums (17 and 18) which are fastened to their shafts (10 and 9) respectively. No. 16 is a foot-operated band brake which is provided to bring the band (16) into frictional engagement with the outer surface of the clutch member (7) for holding it and the pinion (20) with its engaging gears and haul-drums. No. 19 is the incoming loaded cable, and 21 is the outgoing slack cable. No. 22 is a somewhat enlarged groove provided to receive the last fold of the outgoing cable and designed to create a pull on the cable as it leaves the drums, thereby acting as a spool-tender by keeping the cable tight in the preceding grooves in case the variation in the diameters of the several preceding grooves exceeds the requirements of the shrinking cable.

The motor and controlling apparatus required to operate the "Canuck" are to be of the common type as designed and manufactured for use in heavy service such as will be required of these hauls. And in cases where it may be desirable, a steam donkey may be used to furnish power and a gear train substituted for the steel chain drive as shown.

The "Canuck" was designed primarily to meet the requirements of the shrinking cable when being pulled in by rotating grooved drums. And while its range of usefulness can in no way compare to that of the "Chinook" it does furnish one means of applying power to a hauling cable at constant leverage and is one step in the solution of the problem of adapting electric haulage to logging works. And where operating conditions are such as to make the use of an endless cable roader practicable it will be serviceable as such; and by attaching a third drum it will be able to do the loading. The brake (16) engaging the friction member (7), as it does give it a powerful levering over the load, so the machine will be serviceable as a lowering haul for handling logs off from steep, rough ground where, by making use of a tail-block having sufficient strength and anchorage, the outgoing cable may be used as a hold-back to let the logs down at any desired speed.

The "Canuck" presents a rather unique, yet simple means of applying power to a hauling cable. And it is such a simple little machine, so inexpensive to construct and install, so simple and economical to operate and control that wherever the use of an endless cable system is practicable and desirable it will be a very simple means of introducing electricity in the woods.—The Timberman.

Hoo-Hoo Annual at Asheville

The twenty-first annual meeting of the Concatenated Order of Hoo-Hoo was held at Asheville, N.C., on July 18th, 19th and 20th, and was a most successful and encouraging event. The attendance was unusually large and a number of important matters were discussed and disposed of. The chief of these was the decision that in future Hoo-Hoo should have permanent headquarters at St. Louis, Mo. Another matter of importance was the appointment of a new Supreme Scrivenoter, on account of the resignation of Mr. James H. Baird. The nominations for a successor to Mr. Baird were two in number, Messrs. Wm. M. Stephenson, who had occupied the position of Supreme Representative for two years, and J. C. McGrath, Arkansas. The election resulted in favor of Mr. Stephenson the vote being as follows: Stephenson 4347¾; McGrath 3577¼.

The selection of officers for the ensuing year resulted as follows: Snark of the Universe, F. W. Trower, San Francisco, Cal.; Senior Hoo-Hoo, J. M. English, Asheville, N.C.; Junior Hoo-Hoo, E. D. Tennant, Winnipeg, Canada; Bojum, John Oxenford, Indianapolis, Ind.; Jabberwock, J. F. Wilder, Hattiesburg, Miss.; Custocatian, L. R. Fifer, Seattle, Wash.; Arcanoper, J. B. Baker, Hodge, La.; Gurdon, George J. Michelsen, Rochester, N.Y.

A feature of the proceedings was the holding of an excellent business session and initiation by the Osirian Cloister which had not held a meeting for nearly two years. At the conclusion of the annual meeting of the Order a splendid session on the roof was held at which thirty-three kittens were shown the light, in the presence of nearly 200 experienced old members. The Asheville Hoo-Hoo left nothing undone for the comfort and entertainment of the visitors and the general success of the annual was in no small measure due to their efforts.

One of the pleasantest features of the annual was the presentation of a gold watch and chain to Mr. J. H. Baird, the retiring Supreme Scrivenoter, who had occupied this important position for sixteen years, during which a great deal of the success of the Order had been the direct result of his untiring efforts.

Messrs. Kenneth M. Clark and James A. Conners, of the forestry staff of James W. Sewall, Old Town, Maine, have gone into northern Maine to take charge of the mapping, surveying and exploring of a large tract of land for the Great Northern Paper Company. Mr. Sewall is on a short trip in the upper Penobscot region of Maine, in the interests of one of the timberland owners of that state. Last year Mr. Sewall had charge of the complete mapping, estimating and surveying of approximately 500,000 acres of land, in both Canada and the United States. This year's work bids fair to equal that of 1911, as it has extended from as far south as the Isle of Pines, through Kentucky, North Carolina and Maine into Nova Scotia.

Secretary of the Treasury MacVeagh, of Washington, has decided that wood pulp, print paper, and paper board manufactured from woods of British Columbia, from which the export restrictions were recently removed by the Council of that province, will be admitted to the United States free of duty under the one operative clause of the Canadian Reciprocity Act. The woods affected are on certain leases controlled by the Powell River Company in British Columbia, lying west of the Cascade range mountains. The order is expected to increase importations of free wood pulp and paper to the Pacific coast States, and will be in effect after July 12.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

WANTED—A quantity of 4/4-in. Ontario Plain Red Oak, vicinity of Georgian Bay preferred. Apply Box 535, Canada Lumberman, Toronto, Ont. 14-17

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co., Ltd., Toronto, Ont. 7-tf

Slabs and Cord Wood Wanted

Am open to buy any quantity up to 10,000 cords hard and soft wood slabs and cordwood. Write me. Horace Hartley, 19 Mayor Street, Montreal. 15-19

Square Hemlock Wanted

8 x 8 and up x 10 ft. and up, Merchantable Hemlock. Horace Hartley, 19 Mayor Street, Montreal. 15-16

White and Red Pine Wanted

3 in. x 6-in-7-in. 18 ft. Tank Stock.

Ontario Wind Engine & Pump Co., Ltd.
Toronto, Ont. t.f.

Trimmer Ends Wanted

Price and freight rate permitting we will contract to take your White Pine Trimmer Ends, rotten pieces thrown out, fresh stock and not colored. Write price per cord on car and state shipping point.

The Wm. Cane & Sons Company, Ltd.,
11-17 Newmarket, Ont.

Birch Wanted

Want 200 M. ft. 10/4 1st and 2nds and No. 1 Common Birch. Give average widths and lengths and percentage of 14 and 16 ft. lengths. Want price delivered Philadelphia, Pa. and New York City.

Want 200 M. ft. 6/4 No. 1 Common Birch delivered Boston, Mass.

Want 5 cars 4½ in. and 5 in. 1sts and 2nds. Birch delivered New York City and Philadelphia, Pa. Reply Box 526 Canada Lumberman, Toronto, Ont. 14 T.F.

FOR SALE—LUMBER, ETC.

FOR SALE—200 M. ft. 5/8 No. 1 clear Spruce, cut 1910 and 1911. Also 100 M. ft. Cedar, 8 x 8, 12 x 12. Edouard Ruel, Lauzon, Levis, Que. 16

For Sale

For quick shipment, 100 M. ft. 2-in. Birch, December, 1911, cut. No. 2 C. & B. at $20 per M. on cars. Farm Point, Que. Hall Bros., 174 Mutual Street, Toronto, Ont. 16t.f.

For Sale

100 M. ft. 2-in. Cull Spruce. 300 M. ft. 1-in. Cull Spruce. 15 M. ft. 1¼-in. M. C. White Pine. 50 M. ft. 2-in. M. C. White Pine. Fred T. Smith, 310 Board of Trade Bldg., Montreal, Que. 1.t.f.

For Sale

500,000 feet Band Sawn Birch 4/4, 5/4 and 8/4 in shipping condition, rail or water shipment The Rathbun Company, Deseronto, Ont. 14-17

For Sale

To the manufacturers: Birch, Maple, Basswood and Elm in all thicknesses. Send us your enquiry. The Meaford Lumber Company, Meaford, Ont. 7-20

Lumber For Sale

4 cars 1-in. good cedar for boat building.
100,000 ft. 2 x 6 mill run hemlock.
100,000 ft. 2 x 8 mill run hemlock.
4 cars 2-in. white oak, sound and square edge. Apply to Geo. C. Goodfellow.
Montreal, Que.

For Sale

For quick shipment, 800,000 ft. Birch. All grades and thicknesses.
200,000 ft. Soft Elm M. R. All thicknesses.
100,000 ft. Basswood M. R. inch.
100,000 ft. Maple. All grades and thicknesses.

Send us enquiries. The Meaford Lumber Company. 7-20

FOR SALE—MACHINERY, ETC.

Cowan double surfacer, pipe bender, rope drive, ribsaw, one fifteen horse motor D. C. one twenty-five horse generator D.C. Apply Gold Medal Furniture Manufacturing Company, Toronto. 15-17

For Sale

Locomotive, suitable for yard work, standard gauge, saddle tank,—15 tons. Sheam pressure 140 lbs.; steam boiler. All in good condition. Apply Empire Lumber Co., 1205 Traders Bank Bldg., Toronto, Ont. 16

Saw Mill For Sale

On Georgian Bay, adjacent to North Shore, good two-storey circular mill in good running condition, double edger, trimmers, capacity about 12,000 feet per day; plenty timber available and ready sale for slabs; splendid opportunity for small millman; will be sold cheap as owners have other interests requiring their attention. Box 444, Canada Lumberman, Toronto, Ont. 5-TF

Machinery For Sale

A Waterous No. 4 Band Saw Mill, with Carriage Saws, Live Rolls, and complete Filing Room equipment, also several Good Woodworking Machines, in splendid condition.

J. S. FINDLAY,
2-TF Owen Sound, Ont.

For Sale

Sawmill, in good condition, on Burford Lake, six miles from Wiarton, equipped with 70 H. P. boiler, 60 H.P. engine, new carriage by Long Bros., Orillia, Ont., good trimmers and endless chain attachment for hauling logs out of water.

Terms, etc., apply Massey-Harris Company, Toronto. 4-T.F.

Machinery For Sale

Carver, 4 spindle Rohlman.
Cut-off saw, railway.
Dovetailer, Boults.
Engines and Boilers.
Jointer, chair seat, Jenkins.
Jointer, 16-in., Clement.
Moulder, 2 side, 6", Smith.
Moulder, 3 side, 6", Smith.
Moulder, 4 side, 6", Houston.
Moulder, 4 side, 9", Fay.
Moulder, 4 side, 12-in., Woods, inside.
Mortiser, Smith.
Mortiser, Bit.
Planer, 20-in. Gem.
Planer, 24-in. Cincinnati.
Planer and matcher, 9-in. by 6-in. Berlin.
Resaw, band, American, 48-in. wheel.
Resaw, 42-in. corcular.
Rip saw, circular, self feed, Williamsport.
Sander, 24-in. Perry, power, two drum.
Saw Gummer,—Rogers.
Saw-mill, band, 63-in. wheel, carriage 18 ft.
Shaper, home made, wood frame, 2 spindle.
Shaper, iron frame, wood table, 2 spindle, light.
Shaper, iron frame, wood table, 2 spindle, heavy.
Swing saws, 6 ft.

O. L. Packard Machinery Company,
C Milwaukee, Wis.

Logging Equipment For Sale

100 Russell logging cars, complete with all chains, brakes, etc., in strictly first class condition at exceptionally low price. Full outfit of logging equipment, horses, harness, sleighs, chains, tools, blankets and camp outfit, all at a small fraction of its value. Write for prices and full description to Yawkey-Bissell Lumber Co., Arbor Vitae, Wis. 14-17

WANTED—EMPLOYMENT

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

Experienced engineer accustomed to running and repairing locomotive, wants position. Apply to Empire Lumber Co., 1205 Traders Bank Bldg., Toronto, Ont. 16

Executive position desired by young man capable of handling Southern States imports. Has practical and commercial experience, covering period of twelve years. Replies solicited to Box 553, Canada Lumberman, Toronto, Ont. 16

WANTED—Position as Bookkeeper and office manager with wholesale lumber firm. Ten years' experience; competent to handle all of a lumber office work. Best of references furnished. Apply Box 521, Canada Lumberman and Woodworker, Toronto, Ont. 13-16

Manager and Salesman

Would like to correspond with large first class Hardwood Manufacturers unrepresented in New York territory, who would open office here. Years of experience in all lines of hardwood trade. Well known and draw large business. Employed now and could hold open for 1913. Married; good salary wanted. Box 551, Canada Lumberman, Toronto, Ont. 16

WANTED—EMPLOYEES

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

WANTED—A manager for retail lumber business in Alberta. Apply Box Canada Lumberman, Toronto, Ont. 16-17

WANTED — General Superintendent for Sash and Door Factory and General Planing Mill. One who understands Plans, Cost, Estimate and having good control with men. Good position to the right man. Address Box 552, Canada Lumberman, Toronto, Ont. 16-17

WANTED—Lumber traveller acquainted with Western Ontario wholesale trade. Must be strictly temperate. Apply, stating salary expected and experience. Selling pine and hemlock principally. Box 554, Canada Lumberman, Toronto, Ont. 16

Reporter

We want an energetic representative in each town in Canada to report on building and engineering work—to tell us where machinery, equipment, supplies or materials may be sold. Reports are paid for on the per item basis. It depends upon your own efforts how much you make. This is a profitable side line and there is good money in it for a hustler. Write to MacLean Daily Reports Limited, 220 King Street West, Toronto.

BUSINESS OPPORTUNITIES

For Sale

Retail Lumber Business, situated in central position, Calgary, Alta. Premises for sale or on lease. Stock at wholesale price; easy terms. Wattsburg Lumber Co., Ltd., Wattsburg, B.C. 16 & 17

Timber Limit For Sale

1,200 acres Hardwood, Hemlock and Cedar. Some Pine; 9 million feet for $5,000 cash. Five miles from railroad; two from river. Box 431, Canada Lumberman, Toronto, Ont. 6-t.f.

For Sale

Timber limit, comprising 18 sq. miles, containing 25,000,000 feet mixed timber. Apply Geo. S. Nesbitt, Rupert, Que. 16-19

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

For Sale — Sawmill with Capacity

Of one hundred thousand feet per day. Located in Everett, Wash. Good rail and water shipping facilities. Ten and one-half acres of land with excellent mill pond. Price less than one-third of appraised valuation. 15-18

Address, P. GARDINER, Everett, Wash.

For Sale

Established Lumber Business, with first-class mill, now running full time. Timber limits with 20 to 30 million feet of standing pine timber conveniently located, and all merchandise, etc. Price $55,000. This is worthy of investigation. Address Box 332, Canada Lumberman, Toronto, Ont. 19-22-t.f.

WANTED—Owner of good Portable Mill or two, to take an interest with us in 4,000 acres spruce and birch timber tract in Quebec. Fine mill sites on two streams, level road to station—three miles—good and ready sale of lumber. We own the timber but want experienced men to take contracts from tree to train.

LAYCOCK LUMBER CO.,
16 Ellicott Square, Buffalo, N.Y.

Timber For Sale

Tenders will be received up to and including the first day of October, 1912, for the right to cut white and red pine and spruce, on two timber berths on the upper waters of the Jocko River east of the townships of Garrow and Lockhart, in the District of Nipissing, Province of Ontario, the berths being designated "Jocko No. 1" and "Jocko No. 2," each containing twenty-five square miles more or less.

For maps and conditions of sale apply to the undersigned.

W. H. HEARST,
Minister of Lands, Forests and Mines.
Toronto, July 17th, 1912. 15-18

Important Sale of Valuable Timber Limits

Sealed tenders will be received by the undersigned up to and including the **20th day of December, 1912**, for the purchase of:

Limit No. 194 of 1873-74—River Jean de Terre—tributary to the Gatineau, containing an area of fifty (50) square miles, more or less.

Limit No. 195 of 1873-74—River Jean de Terre—tributary to the Gatineau—Island Lake, containing an area of fifty (50) square miles, more or less.

These limits comprise some of the best pine and pulpwood areas in the Province of Quebec.

Map showing location of these timber limits and report thereon may be inspected at the offices of the undersigned and from whom further information may be obtained.

The highest or any tender not necessarily accepted, and the acceptance of any tender will be subject to the approval of the Court.

Dalhousie Lumber Co. Increases Its Holdings

The Dalhousie Lumber Co., Ltd., which now possesses extensive timber limits in Restigouche County, with headquarters at Dalhousie, N.B., is reported to have closed a deal by which it takes over 100 square miles of well wooded limits located on the York River, Gaspe County, P.Q. The purchase was made from the Gaspe Trading Company and sixty miles of these valuable limits are in fee simple. The new owners will proceed at once to enlarge the plant, which will consist of shingle mill, long lumber and pulp mill. The estimated value of the property after the proposed improvements are made will be about $350,000. The operations at Gaspe will be under the management of the head office of the Dalhousie Lumber Company at Dalhousie, with A. H. Hilyard, formerly of St. John, as manager.

Better Methods in Manufacturing Lumber

With the above title, the Wood-Worker, in a recent issue, publishes a letter signed by a D. C. Grandin in which the writer makes extended criticism of present methods of manufacturing lumber and makes a number of suggestions as to improvements that should be made. We do not believe, says the Mississippi Valley Lumberman, that his conclusions as to the faulty methods of manufacture were reached after a very extended study of what is being done by the modern sawmills of the country, or from a very extensive knowledge of the methods used in the manufacture of by far the larger part of the lumber output. They apply, undoubtedly, to a considerable number of the smaller mills in all parts of the lumber producing sections. His chief criticism is on the methods used for sorting, but practically all of the up-to-date mills, so far as the observation of the editor of The Lumberman goes, have sorting platforms at the tail of the mill where the various grades and lengths of lumber are economically divided and sent to their respective locations in the yard at a minimum of expense. On this subject he says:

"A party of sawmill men were recently discussing ways and means of reducing handling expenses. One of them took the ground that the main trouble at present is the way the logs are handled. He pointed out that in many mills, if not most of them, logs are brought to the saw without regard to their length. They are cut up just as they come. If there happens to be a 10-foot log at hand, it is put on the saw, while the next one may be 16-foot or only 8-foot. It doesn't require much thought to see the amount of wasted effort that is involved here. In the first place, the saw and its accompanying equipment have to be adjusted to the new length, and that takes time that might have been used to advantage in manufacturing. After the lumber is cut it is of all lengths, and leads to the expenditure of a lot of unnecessary labor in assorting for the various piles. Instead of being able to load a truck and have it hauled to the pile of 10, 12 or 14-foot boards, as the case might be, it is necessary to deliver part of it to one pile and part to another, the result being that time is taken and ground covered needlessly and expensively."

As before stated, by far the larger part of the mills have sorting platforms where machinery is provided for just this class of work, and where it is done with the least possible expenditure of time and effort. The alternative would be the sorting of the logs before they go to the saw, either in the mill pond or at the point where the logs are loaded on the logging cars. In either case the process would require a vast amount of heavy hand labor under conditions not favorable for economical work.

Again, he says, "Some operators who are looking for ways to decrease expenses even take the ground that it would pay to assort lumber as to widths as well as lengths. Some of the most successful men in the business are using this system and find that it pays. It means more labor at the saw, of course; but it also means less in the yard, when the orders come in. Buyers of lumber have reached the point where they specify exactly what they want, and the lumberman who has to tear down five or six piles to select the boards that fit into a particular order is not in line to make very much money on that business."

It is a part of the work of the man at the sorting platforms of the modern mills to divide all lumber that comes from the mill into kinds, grades, lengths and widths. This is quickly and easily done, and each is taken to its particular location in the yard. The various classifications are made, in piling; so that in loading out orders, the least possible time is consumed. In the yard of such a mill one does not see different lengths, different grades or different widths in the same pile, and it is never necessary to tear down piles to get at what is wanted by the buyer. Price lists and quotations are made on the different grades, lengths and widths; but there is also a place on the list for mixed widths, but these are only piled together in the case of low grade stock which is usually sold and used that way. The carriages of modern mills are so built as to take either the long or the short logs with no pause for the adjustment of equipment, and no lost time in bringing logs of different lengths to the saw.

If Mr. Grandin's criticism applies to any class of mills it must be the small hardwood mills, or small mills in sections where other kinds of lumber are manufactured, and where the size of the operations does not admit of the expenditure of an amount necessary to provide the latest forms of equipment. Modern mills cutting mixed hardwood timber are able to sort the stock as it comes from the mill and do it with the least possible delay and effort. We can easily see that the mill with only one or two trucks on which to transfer the lumber from the mill to the pile would be handicapped, if it attempted to manufacture several kinds of lumber at the same time. In such a case it would, perhaps, be economical to sort the logs as to kinds and lengths before they went to the saw.

Pioneers in Double Band Sawing

In the Canada Lumberman of August 1st an article was published relating to the first installation of a bandmill in Canada. It was stated that the first double cutting band saw operated in Canada was at the mill of the J. D. Shier Lumber Co., of Bracebridge, Ont., and that the mill was one of the old "Atlas" make. Those who are acquainted with the band mills in use in Canada will have understood that this was an error and that the name of the mill should have been "Allis." The mill in question was the telescopic band manufactured by the Waterous Co., Brantford, Canada, on the Allis patterns and at the time of its installation seemed to be the only solution of the double cutting problem. Some years later the Waterous Engine Works Co. designed their double cutting guides which made double cutting on a solid mill possible. They were introduced in the Conger Lumber Company's mill at Parry Sound in 1901. This mill was therefore the pioneer in double cutting on a solid mill, the arrangement which has almost entirely replaced the telescopic model.

Canadian Woods in Liverpool

Messrs. Alfred Dobell & Co., Liverpool, Eng., in their monthly Timber Market Report dated August 2nd, give the following information:

During the past month supplies came forward liberally and met an excellent consumption notwithstanding the fact that deliveries were again interfered with owing to shortage of railway wagons. Values generally were very firm and in some articles an advance was recorded.

Canadian woods—Waney board and square pine—There was a moderate consumption at firm figures. Oak—There were no arrivals. Stock is light and prices very steady. Rock elm—The import consisted of a small parcel per liner. There was a good demand at unchanged quotations. Birch—Logs continued to arrive on a liberal scale per liners from Quebec and Halifax. The consumption was above the average, but the stock is heavy. Prices were easier. Planks have also arrived freely. The consumption figures include substantial transhipments from Liverpool. Stocks are excessive and values lower. Pine deals and boards—The import and consumption were on a normal scale. Quotations unchanged. New Brunswick and Nova Scotia spruce deals—As compared with this time last year the arrivals to the Mersey ports were 3,870 standards less, the consumption 4,520 standards more and the stock 970 standards less, which is a healthy position. Prices firm.

Measure Your Lumber With the Barkey Lumber Register

The most accurate measure on the market.
Can be instantly adjusted.
Capacity 60,000 feet.
Measures any width and length.
Can be used on any moulding or matching machine.
Will work backward as well as forward, and will not slip on smooth or icy boards.

SENT ON 30 DAYS' TRIAL. RETURN AT OUR EXPENSE IF NOT SATISFACTORY.

Review of Current Trade Conditions

Ontario

The inability of the railroad companies to supply cars for the transportation of British Columbia shingles, owing to the large amount of grain being moved in the West, is causing several Ontario firms no little inconvenience. Several of the firms are behind in their orders and state that they cannot rely on deliveries. No advances in prices have been announced in B. C. shingles to date.

Trade in Ontario continues to be very good with prices about normal, although the scarcity of dry hemlock is causing some annoyance. Dry lath are also hard to get, and firms that are fortunate enough to have a stock on hand are besieged with orders. The pine market is firm with a good demand, and apparently large stocks on hand.

The hemlock market is causing some pessimistic views to be taken by the local dealers, as to the probable cut and source of supply for next year. This year's cut is said to have been from forty to fifty per cent. lower than any previous year, and owing to the large amount of building under way in the larger cities, the demand has been very heavy, coupled with the best of prospects for next year. Bark dealers state that whereas in other years they have been able to get from 25,000 to 30,000 cords of bark per season, this year they have only been able to get about 12,000 cords. It will thus be readily seen that this year's cut has been considerably below the average, but the building trade continues to be good, with expectations that next year will eclipse all records and the mills are preparing to take out a cut this coming winter that will again put the market on a good footing so far as stocks are concerned.

The hardwood trade continues to be good, with fair prospects of further demands. Prices are normal as a rule, with a small advance in basswood and rock elm. Basswood No. 2 and 3 common is selling at $17 and 6/4 and 8/4 common and better at $37.00, an advance of $2 per thousand. Rock elm No. 2 common and better 6/4 and 8/4 advanced to $37, but birch, maple and oak remain about the same.

Taken as a whole the trade in Ontario is good and promises to continue so for some time.

Eastern Canada

Lumber trade conditions at Montreal have been practically unchanged during the last fortnight. There is a good amount of business in progress both with wholesalers and retailers. Prices of shingles, clapboards and ties are higher. Trade with the United States is in moderate volume and conditions are better than they were a year ago. Shipments to Great Britain and Europe are more active than earlier in the season on account of the fear of a tie-up of cars in the fall. The demand from the other side of the Atlantic is good. There is an exceptionally heavy demand for news print paper from the United States.

Trade in Eastern spruce at Boston is fairly active. A few buyers are holding off in expectation of further reduction in prices. Although prices are a little lower than they were a couple of months ago, manufacturers and dealers report that higher prices are to be expected by September 1st. A steady movement is reported in frames, the highest price offered is $24.50. A few mills are still asking $25. Random is firm. Dealers are asking $22 to $22.50 for 2 x 4's and sales at the latter price are reported. For 2 x 3, $21.50 is the price asked. There is a fair demand for boards and the offers of dry lumber are small.

Shingles at Boston are moderately firm. Cedar extras are offering at $3.90 to $4 and sales are reported at both prices. The quotations for clears are from $3.55 to $3.65 and choice stocks are bringing the higher price. Lath are moving moderately well. A slight improvement is reported for 1⅝-in. Prices range from $4 to $4.10. For 1½-in. prices are from $3.65 to $3.75.

At New York, the demand for eastern spruce continues strong and wholesalers are experiencing some difficulty in securing shipments. Most of the yards have fairly good assortments. The building trade is active and is taking plenty of stock. Prices are satisfactory. Hemlock at New York is in strong demand with prices about steady. Stocks are scarce although there seems to be no indication of higher prices.

Hemlock boards are firm at Boston. Dry stocks are light. Eastern clipped boards are firm at $22 to $22.50. Northern boards are selling at $22.

Great Britain

An improvement is reported in the London spot market, the long continued dock troubles having resulted in reduced receipts, and it is expected that an advance in prices will result in the near future. It is reported, in fact, that higher prices are fairly general already. The demand at present is moderate but with the settlement of the strike there is a good prospect of improvement. Deliveries at London docks for the week ending July 27th totalled 5,830 standards, as compared with 6,034 during the corresponding week of 1911. At Churchill & Sim's recent auction sale, Vancouver clear silver spruce brought from £24 5s to £21 10s, according to weight. A parcel of spruce from Montreal was sold at £10 5s for 3 x 9, 3 ft. fourths. Red pine thirds, 3 x 6, 12 to 15 ft., from Ottawa, brought £9 15s, and seconds 3 x 5, 12 to 16 ft., brought £10 5s.

Liverpool reports state that the timber trade is steady and that the labor difficulties have had little effect upon trade conditions. No change is reported in the market for spruce deals and none is expected for the balance of the season unless a slight advance occurs. Some importers are inclined to expect an advance of this nature, on account of the freight market situation. Steamers suitable for carrying deals are scarce and can only be secured by paying high rates of freight. The spruce spot market is not very active, although one would expect consumers to secure their requirements at present prices as there is little likelihood of any decline. Stocks are only moderate. British Columbia and Oregon pine have to a large extent supplanted pitch pine at Liverpool. Stocks of prime lumber of this class are scarce. The lower grades have been coming in more freely, in fact a little more freely than required. The market for birch is only fair although f.o.b. values are high. Imports have been rather extensive compared to the demand.

The timber trade at Manchester is rather quiet but prices are firm all around. Spruce and floorings, particularly the latter, are firm; £10 25s 6d c.i.f. being the price for floorings. British Columbia pine is in strong demand with a likelihood of higher prices. The trade in this is gradually getting into fewer hands.

At Glasgow, spruce continues scarce and in good demand, particularly for 9s and under. Arrivals are light and are quickly taken up. Birch logs have come into the market freely and stocks are ample. Planks, on the other hand, are scarce, and buyers are having trouble in filling their requirements.

United States

A noticeable increase in demand for stocks of lumber throughout the United States is interpreted by most of the trade as the commencement of the fall demand. It is particularly remarkable that there is practically not a single weak spot in the entire lumber trade of the United States and Canada. Retailers throughout the beginning and middle of the present summer were inclined to stand off somewhat, but they have lately realized that they are unable to secure lower prices than those which are prevailing and now they are in the market with extensive requirements. Every department of trade reports a general feeling of confidence so that prices for the commencement of the fall trade are firm, some advance being reported especially in yellow pine. The hardwoods and hemlock, spruce, white pine and norway pine are all firm. Old members of the trade are unable to recall a period where such a general firmness was more pronounced than it is to-day. If one were to seek for the cause of this condition it would be found more than anywhere else in the shortage of stocks. Surplus stocks are practically unknown at any stage from the mill to the retail yard. The demand at present is neither local nor confined to any particular class of trade. Retailers, factory consumers and the railroads are all keen to have their orders filled without delay. This demand is of the hand-to-mouth character, but being so wide-spread, is causing exceptional movement of stocks.

Chicago:—The demand for northern pine, particularly Norway joists, is strong, No. 2 common has recovered from the slight lull of a week or two ago. The demand for hardwood is improved and a good fall trade is practically certain. A number of inquiries are coming from furniture and farm implement manufacturers. Ash and oak are firm, the railroads being in the market for extensive quantities of the latter. The better grades of plain and quartered oak are moving steadily. Hemlock stocks are scarce in the desirable sizes and the demand is firm with prices strong and inclined to advance. Hemlock has benefitted from the improved demand for yellow pine. Spruce and cedar are firm and the outlook is improving as the season advances. Increased inquiries are reported for yellow pine and some concerns are unable to fill orders as fast as required. The railroads are extensive consumers at present. Other consumers who have been out of the market for a long time are coming back. The demand for red cedar shingles is moderate only. Prices have advanced, clears bringing $3.32 and stars $2.84, Chicago basis. Lath continues firm and in steady demand.

Buffalo.—There is a fair trade in the various grades of northern pine and the lower grades are firm. Advances are expected in the

ONE OF THE MANY LARGE RAFTS OF LOGS THAT COME TO OUR MILL AT SARNIA, ONT.

BUY THE BEST

Retailers and woodworking establishments who like to get AI NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

How about PINE LATH? We have a fine dry stock on hand for immediate delivery.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"RUSH ORDERS RUSHED"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

A. F. Holden, Pres. J. M. Diver, Vice Pres. and Gen'l. Mgr. E. C. Barre, Ass't. Mgr.

near future on account of lightness of stock. Good lumber is scarce. The box factories are rather quiet but are expecting improvement in the near future. Trade in hardwoods continues active. Nearly all classes are held at firm prices and many classes are short. The demand for plain oak is good although stocks are extensive. Maple is in good demand and the low grades are disappearing. Orders for hemlock continue numerous and an advance in prices on the part of Pennsylvania mills is not unexpected. A normal demand exists for fir and spruce, with prices well maintained. Prices of yellow pine continue strong and there are plenty of orders ahead. The outlook is excellent, as the building prospects are numerous and the railroads are able to make better deliveries than a few weeks ago.

Bay City and Saginaw.—Northern pine is moving steadily and prices are firm. The box business is active and taking more than the usual amount of stock. Building operations are numerous and are using large quantities of pine.

North Tonawanda.—The demand for northern pine continues steady with prices strong. The trade, however, is largely of the hand to mouth nature. Box and lower grades are in fair supply but are moving steadily.

Market Correspondence

Quebec Timber and Pulpwood Markets

Quebec, August 5th; (Special correspondence of the Canada Lumberman); Although a large quantity of lumber and deals are being shipped from Quebec for the European markets, there are no new sales to report. Nearly all the sales were made during the winter season in Great Britain. Some rafts of square timber have arrived here lately, mostly white pine from Ontario. They are generally on owners' account for shipment to Europe. There is also a good deal of timber and deals being brought down by cars.

The demand for lumber for local building purposes is not brisk at present. While there are considerable building operations going on, particularly large constructions, reinforced concrete is being largely employed in flooring as well as in the concrete walls, etc.

The trade in pulpwood is very large, and almost daily steam barges with pulpwood piled high above their decks pass by here en route to Ontario and United States ports on the upper lakes. This comes from places in the lower St. Lawrence as far east as the Island of Anticosti. In addition to the above a considerable quantity is shipped from this port to the west.

The price of pulpwood is now quoted as follows at Quebec: hand peeled, $7.50 per cord; machine peeled, $9.25. The former is four feet in length, the latter two feet. While the supply along the banks of the lower St. Lawrence is said to be enormous, the demand keeps steadily up and prices are firm.

Montreal Transatlantic Shipments Increasing

Montreal, Aug. 10th. (Special correspondence of the Canada Lumberman).—There is practically no change to report in market conditions. Business, both wholesale and retail, is good, without any great outstanding feature. Shingles, clapboards, and ties are higher in price, and values generally are well maintained. It is possible there may be a lull in the building boom, for although the figures of the permits show an increase over those of last year, some operations are being held up by an order of the Controllers prohibiting the issue of permits until streets have been surveyed by the Department. This work is three months in arrears, but it is probable that more surveyors will be engaged. For last month, the building permits totalled $1,748,550, an increase of $690,789, while for the seven months the total was $9,816,543, a gain of $1,550,645.

There is a moderate amount of business passing with the United States, the general conditions showing an improvement over those of last year. Canal boats to New York are more plentiful than they were. Freights to Boston have advanced and boats are scarce, with the result that trade to that port is hampered.

Shipments to Great Britain and the European ports are being rushed ahead as far as possible, on the fear that there will be a severe tie-up of cars in the fall. The demand from the other side is good, and so far the exports, especially of pine, are ahead of those of last year.

News Print Mills Rushed With Orders

With reference to pulp and paper, the news print mills claim that they have more business than they can conveniently handle. In ground wood there are larger exports to the United States than in any previous period during the last six months, and prices are up one dollar per ton. Owing to the hot weather, the pulp working streams in the United States have been reduced one-third of their capacity. There is very little Crown wood in stock at the Canadian mills and pulp makers on this side fear that they will not have sufficient pulp to cover the United States requirements from this time until the late fall.

As to the proposed changes in the legislation affecting news print and sulphite pulp in the United States, it may be pointed out that the Senate and the Republican minority in Congress endeavored, with the assistance of other interests, to cancel the reciprocity measure now on the United States Statute Book, and with it the clauses referring to sulphite pulp and paper duties. They proposed to cut in two the sulphite pulp duties and to reduce to $2 per ton the duty on news paper and on wood cut from Crown lands. The Mann committee three years ago recommended a tariff of $2 per ton of news paper, and Mr. Mann is now one of the framers of the proposed measure, which was attached to the Excise Bill. When the measure reached Congress, the Democrats refused to ratify it, and after conference it was finally rejected.

Commenting on these events, a prominent authority on pulp and paper states that in his view the action of the Senate indicates that the penalties placed upon sulphite and news paper manufactured from Crown lands wood in Canada have not had the desired effect of compelling the Canadian provinces to remove the embargo put upon Government lands wood, and that the sentiment among high protectionists in the United States is to still further remove the barriers now existing against Canadian sulphite and news print imported into that country.

Firm Prices at St. John—Labor Scarce

St. John, N.B., Aug. 10th; (Special correspondence of the Canada Lumberman): The prices of all wood goods at St. John remain just the same as in my last letter, business is good, and the only drawback experienced by the mill operators in this section is the question of labor, which is at present very scarce for the better class. Of course for ordinary work there is a good supply. The first steamer from London to this port that we have had in over six weeks has just arrived, and it is said that the only space left for lumber was about 300 standards, or comparatively no room at all. This is caused by the strike of the London dock workers which has just been settled. No decrease in freights has been reported to date, and very little tonnage is available. Freights to New York yet remain at $4.00 on long lumber, with 80 cts. on laths. About 25 vessels are now at this port loading and loaded, all for American ports, and are largely tern schooners carrying from 300 to 500 M. superficial ft. Nearly all the laths have been shipped from St. John and the quantity left on wharves at mills is light.

Local business continues to be good and large quantities of refuse lumber are going into consumption.

Logs are not moving very rapidly out of the booms at Fredericton owing to the scarcity of men, many of them departing for the hay fields at this time of year. The boom company have rafted to August 1st about 60 million superficial feet and expect to be done rafting by October 1st. The last drive of 1 million of logs have reached the boom limits this week. This about completes the season's work except for two to three million logs which are being held in what is called Six Mile Island booms just about Grand Falls. This will be sluiced over if the water rises sufficient to make clean driving to booms at Fredericton.

About half of the mills at St. John are sawing for the American market which keeps strong and prices are still where they were a month ago. It is the opinion of the mill men that after September first they will have a better American market.

It is understood that one mill on the river has disposed of its entire cut of English deals to W. M. Mackay at near last season's prices but this has not been verified by the seller.

Shingles are very firm and almost impossible to get, especially for local use. In fact a good many western shingles are being imported into St. John also clapboards, largely from British Columbia. The cedar shingle market is very apt to remain firm as there is a great shortage in the cut of cedar logs.

The St. John River Log Driving Company met on Aug. 5th and sold the unmarked logs which had come into the company's booms. The lumber amounted to 745 M. spruce, 73 M. pine, 74 M. cedar, 43 M. hemlock. The price of the spruce was lower than last year.

The buyers were as follows: York & Sunbury Milling Co., St. Mary's, spruce, $13.40; Murray & Gregory, Ltd., pine, $10.50; cedar, $11; Hilyard Bros., hemlock, $9.25.

The prices realized last year were as follows: pine, $14.50; spruce $10.25; cedar, $9.40, and hemlock, $7.50.

EDGINGS

Ontario

Mr. Benjamin Mundell, Erin, Ont., is advertising his planing mill and building business for sale.

A fire caused damage to the planing mill, lumber and coal yard of Mr. L. E. Hall, Port Hope, Ont.

The Naylor-Osborne Co. Ltd.. Essex, Ont., have absorbed the business of the Naylor Lumber Company.

John J. Hayne, Brigden, Ont., lumber dealer and manufacturer of cooperage stock suffered loss by fire recently.

The St. Lawrence Paper Mills, Limited, of Mille Roches, Ont., have ordered a centrifugal pump from the Smart-Turner Machine Company, Limited, of Hamilton, Ont.

Fire caused damage to the extent of from $20,000 to $25,000 to the sash and door factory owned by Messrs. Peck & Wills at Belleville, Ont. The cause of the fire is unknown.

The Long Lumber Company, 28 James street south, Hamilton, contemplate erecting a large box factory on Bailey street with a lumber yard in connection. The sum of $150,000 is to be expended on buildings and machinery.

Crockett & Tharle have formed a partnership to carry on a contract they have secured for buildings, station and other work on the line of the Transcontinental Railway, as well as carrying on the timber and tie business, with head office at Fort William, Ontario.

The Stone Lumber Company, Limited, with mills at Marksville, St. Joseph Island, Ont., and at Day Mills near Thessalon, Ont., are building a railroad from their mill at Marksville to their timber limits, a distance of about eight miles, so that this winter their logs will be conveyed to the mill over their own road.

It is reported that the Cornwall mill of the Toronto Paper Company will shortly pass into new hands—the same interests that control the Cornwall Paper Mills at Mille Roches, the Barber Mills at Georgetown and the Montrose Mills at Thorold. Mr. Courtney, the manager of the mills, is leaving Cornwall shortly and will enter a company that proposes building a new mill at Beauharnois, Que. This mill will manufacture high grade papers, such as are now made in Canada only by the Roland Mill. If the deal goes through the mills at Cornwall will be enlarged immediately.

The McAuliffe-Davis Lumber Company, Ottawa, Ont., report that they have experienced a very heavy increase in business and recently found it necessary to increase their handling capacity. They have accordingly purchased a block of land on the southern extremity of the city, comprising about 85 acres, served by four railroads, the C.P.R., G.T.R., O. & N.Y., and the C.N.R. It is the intention at that point to construct a large planing mill built on the most modern plan, together with numerous workingmen's houses in which to house the company's employees. The building will be of the most modern type as well as the machinery. Upon its completion the company will be in a position to supply lumber in standard grades from stock and to handle any amount required of transit mill work for shipment over the railroads named and their connections.

Eastern Canada

Messrs. Hamelin & Forget have registered a sash and door factory at Montreal.

The Grier Timber Company, Limited, has been registered at Montreal. Capital $100,000.

Ouellet & Dionne's saw and planing mill, St. Onesime, Que., was recently destroyed by fire.

The Campbell-MacLaurin Lumber Company, Ltd., Montreal, have increased their capital from $100,000 to $250,000.

The Beloeil Lumber Company, Limited, has been incorporated. The capital is $100,000, and the head office is at Beloeil, P.Q.

The Howard Smith Paper Mills, Limited, Montreal, have taken over the business of the Howard Smith Paper Company, Limited. Capital $1,000,000.

Mr. Hunting. of Massawippi, Que., will erect a sash and door factory at Ayers Cliff, Que. The council have granted him a site and exemption from taxes for ten years.

About two million feet of lumber belonging to the St. John Lumber Company, Van Buren, Me., has been rafted at Fredericton, N.B. Owing to the booms at Van Buren not being in position, this lumber came down with the ice in the spring.

Reports from St. John, N.B., state that a new pulp and paper mill is likely to be erected at Grand Falls, N.B. According to the report those interested include Sir Wm. Van Horne, Montreal, Hon. Wm. Pugsley, Col. H. H. MacLean, M.P., and H. A. Powell, K.C., of St. John, N.B.

The Quebec Labrador Pulp and Lumber Company Limited has been incorporated with a capital stock of $300.000 to secure timber limits and manufacture and deal in timber and lumber and all kinds of wood products with head office at Montreal. The incorporators are R. Chenevert, Advocate; T. D. Broker and P. Gregory, all of Montreal.

La Compagnie de Progress de Saint Flavien Limitee has been incorporated with a capital of $49,900 to acquire lumber and saw mills and carry on a general lumber business with head office at St. Flavien, P.Q. The incorporators are L. Ratte, J. Paquet, farmers, and U. Bernard, accountant, all of Saint Flavien.

It is reported that Mr. Gilbert Desrosiers, manufacturer of doors and windows, 135 Lafrance avenue, Montreal, has surrendered his property for the benefit of creditors. The assets consist of the factory premises, with wood, machinery, manufactured articles and stock in trade, and the liabilities total in the neighborhood of $25,000, the principal creditors being: Oliva

Baillargeon, $6,000; Bank of Hochelaga, $4,200; Madame Anby, $2,000; Geo. Goodfellow, $1,702; G. W. Faust & Co., Ltd., $3,570. A number of employees are amongst the claimants.

On July 30th the mill of the Tourville Lumber Mills Company, at Louiseville, P.Q., was practically destroyed by fire. The boiler room and engines were saved. The loss is estimated at $45,000, the insurance being $35,000.

The Dominion Iron and Steel Company are considering the erection of a cooperage plant in connection with their nail mill at Sydney, N.S. H. A. Butz is the engineer. It is expected that the company will shortly be in the market for machinery for the cooperage plant

The Tourville Lumber Company's mill at Louisville, Que., was recently destroyed by fire. The loss is estimated at $85,000. The company will rebuild the mill and will require new machinery for both steam and water power. The head office of the company is at 107 St. James street, Montreal.

The Laurentide Company, Ltd., Grand Mere, P.Q., have purchased a large tract of territory, consisting of 398 miles of forest, from the Calvin and Power Companies, on the Upper St. Maurice river. The Laurentide Company already own over 400 miles of territory in the district. An addition to the sulphite mill is being erected by the directors.

Sealed tenders are being received by the Secretary of the Department of Public Works, Ottawa, until August 26th, for the delivery of creosoted timber. Specifications and form of contract may be seen at the department or at the offices of Geoffrey Stead, District Engineer, Chatham, N.B.; E. T. P. Shewan, District Engineer, St. John, N.B., C.E.; W. Dowell, District Engineer, Halifax, N.S. and G. A. Bernasconi, District Engineer, North Sydney, N.S.

Western Canada

The Cottonwood Lumber Company, Limited, has been incorporated at Vancouver, with a capital of $250,000

The City Lumber Company, Limited, has been incorporated at Vancouver, with a capital of $50,000

The Sayward timber limit, of 2,400 acres, near Creston, B.C., will, it is said, be put on the market at an early date.

The F. & S. Lumber and Trading Company has been incorporated at Battle Lake, Alta., with a capital of $10,000.

The Red Wing Lumber & Supply Company, Limited, has been incorporated at Victoria, B.C., with a capital of $30,000.

The French Canadian Timber, Limited, with a capital of $1,000,000, has been incorporated, and the head office is at Vancouver.

The U. S. Pacific Lumber & Timber Company, Limited, has been incorporated with a capital of $100,000. The head office is at Vancouver, B. C.

The Seattle Cedar Lumber Manufacturing Company, whose head offices are at Seattle, Wash., have registered as a limited company with provincial office in Victoria, B.C.

The Western Canadian Lumber & Fuel Company, Limited, Vancouver, B.C., is applying for permission to change its name to the Coast Lumber & Fuel Company, Limited.

J. W. Foster, Limited, has been incorporated with a capital of $75,000. The head office is at Vancouver, B.C., and the company will carry on business as timber merchants, etc.

The Rock Creek Land Company, Limited, has been incorporated with a capital of $500,000, to carry on business as timber merchants, sawmill owners, etc. Head office, Midway, B.C.

The Lovett Lumber Company's mill at Westley, B.C., has now been completed, and operations will be started as soon as the first shipment of logs arrive from the Columbia River.

The New Wellington Coal & Coke Company, Limited, has been incorporated, with a capital of $1,000,000. The head office is at Vancouver, B.C., and the company will engage in a general lumbering business.

Messrs. Scholtz, of Seattle, Wash., have purchased about five acres of land on the west side of the Stave River, near Ruskin, B.C., and will erect a shingle and sawmill. Eight or nine machines are already installed and this number will be increased to twenty-four.

The Colonial Securities Company has been incorporated with a capital of $100,000 to carry on a general mining, ranching and lumbering business with head office at Winnipeg. The incorporators are J. T. McKaig, banker; Dr. C. R. Dodderidge and Lawrence Rosewald, broker, all of Winnipeg.

The Saint Andrew's Investments Limited have been incorporated with a capital stock of $100,000 to carry on business as a mining, ranching and lumbering company with head office at Winnipeg. The incorporators are A. E. Hoskin, barrister; C. W. N. Kennedy, agent, and J. D. Morice, barrister, all of Winnipeg.

The Howard Vulcanizing Process

Mr. J. Cameron Jenkins, who was last year sent by Columbia University to investigate the Howard Lumber Vulcanizing Process at the Toronto plant of the company, has reported favorably on the system. Mr. Jenkins says that this process will bring into use woods which up to the present time could not be made use of commercially, owing to the fact that other processes have not been able to dry them without either warping or twisting, or they have been very short lived in their durability.

By this process lumber may be taken green from the saw and dried perfectly in twenty-four hours. The loss in weight runs as high as 50 per cent., with an average around 35 per cent. Shrinking, swelling and warping are practically eliminated.

The cost of the process where steam is not a direct charge, as is generally the case at saw mills, resolves itself into the cost of handling the lumber, plus the cost of a man to look after the plant, which amounts to about the same as it would cost to stack the lumber in the yard and the interest on the investment while air seasoning.

Mr. Jenkins states that he is almost certain that this process will enhance the value of the grade over air seasoning from 10 to 20 per cent. In other words much lumber which is degraded on account of air seasoning will be saved to a high grade.

We advise you to write, wire, or 'phone without delay and get the benefit of our low prices.

Thos. Mackarell & Co.

Ottawa
49 Metcalfe Street

Montreal
Canadian Express Bldg.

We have to report a more satisfactory business, and generally speaking a good demand and maintained prices, the adverse fluctuations have been unimportant. The outlook is favorable and the importers are showing more disposition to contract. Pitch pine—The demand has continued to improve, but the advanced prices quoted have tended to restrict business. The upward movement in freights is making shippers cautious. Hewn timber is inquired for, but only first class wood is wanted. Sawn timber is readily saleable at recent values, but buyers are slow to pay any advance. Stocks are light and further supplies are wanted. Prime lumber is in more demand and prices are better, the lower qualities are not so much enquired for, but values keep firm.—U.S.A. Hardwoods—The import has been heavy, but mostly on old contracts; values are firm but scarcely equal to the figures now demanded by shippers. Spruce deals—The stocks continue ample, and as the liners are bringing forward considerable quantities the supply is more than sufficient. The scarcity of tonnage and high rates continue unabated, and serve to restrict cargo shipments. Birch—both in the log and planks has been overdone and stocks are accumulating. Values are materially weaker. Pine deals—There is no change to report. Hemlock—Shipments are unimportant and there is no special call for this wood.

Liverpool and Manchester Stocks

Messrs. H. N. Lightburne & Co., Liverpool, through their representatives, Messrs. John E. Moore & Co., Ltd., St. John, N.B., give the timber market reports for July 1912, as follows:

What the "Howard Vulcanizing Process" Does

Dries lumber in a day direct from the saw. Improves quality of all lumber. Increases the crushing strength. Increases the transverse strength. Reduces the green weight 30% to 45%. It materially prolongs the life of wood. Emphasizes and beautifies natural grain of the wood. Makes fit for commercial use woods not otherwise merchantable. Eliminates the necessity of maintaining heavy stocks of lumber, thereby saving heavy interest charges, insurance and material loss by deterioration.

The above results are accomplished with the refuse of the mill

To-day the Saw Mills, Railroads, Telegraph, Telephone and other Constructing Companies the world over, are looking for an economical process which will quickly dry direct from the saw the better grades still remaining and also harden, preserve and make merchantable the softer and inferior woods. This the "Howard" Vulcanizing Process accomplished.

We have only a limited amount of this stock for sale at a price which we consider very attractive. Call and see us or write.

The Importance of Efficient Mill Machinery

In Millwork, where every portion of the equipment has to undergo the severest treatment with unusually hard conditions only the best machinery will serve. No mill can be run at a profit with inferior equipment. This is an expression of the opinion of men of wide and varied experience in the business.

P. Payette's Improved Mill Machinery, is built to stand all the strain and hard usage of mill work. This machinery is of the special Payette design and embodies many improvements, which add considerably to the efficiency of mill equipment.

The New Patent Saw Mill Dog which operates in soft or hardwood timber of any kind will do good even work in summer or winter with perfect safety.

Payette's Improved Set Works will set even thickness of lumber in all class of timber and will set any size log with perfect ease, Can be changed instantly so as to make either thick or thin lumber and can be put on any make of carriage.

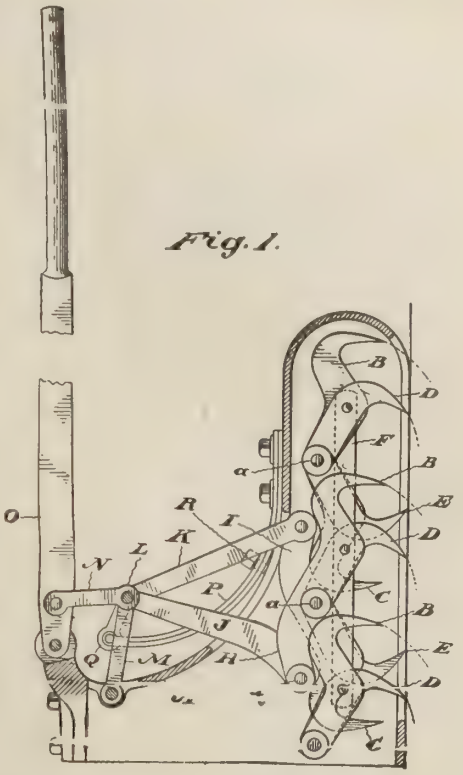

Fig. 1.

We want to prove to you the advantage of this set works in your mill and we are prepared to demonstrate its efficiency and superiority. Full information sent on application. Ask for our booklet on set works.

Buy Guaranteed Chisel Tooth Saws

You need have no doubt about the quality when you buy

SMITH'S CHISEL TOOTH SAWS

No. 2½ Tooth

They are backed by a guarantee as to their durability and will stand up better than any saw made. The shanks are made from a special steel, and we use only the GENUINE "HOE" BITS which are uniform and perfectly true.

Made in several sizes but the following are specially recommended.

NO. 2½ TOOTH—Designed for heavy feeds. Suitable for mills where independent steam feeds are employed, and also for edger saws.

NO. 3—Principally for hardwoods. The best saw where both soft and hard woods are to be cut.

NO. 4—Specially recommended for British Columbia, and for cutting soft, pitchy lumber where more throat room is required.

No. 3 Tooth

Smith's inserted and solid Tooth Saws are specified by the Largest Canadian Manufacturers of Mill Machinery.

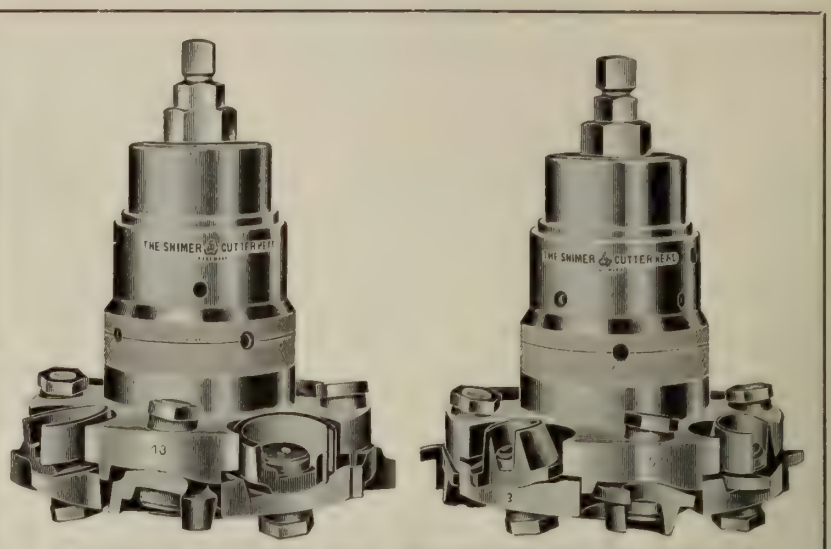
You'll Find It Interesting

to note the different processes in your mill—to measure the *time* given to productive work and that taken in getting ready. You'll be surprised at the amount of time that is needlessly wasted in filing straight cutters to shape and in touching up the shape after each sharpening—in making adjustments to suit the different kinds and conditions of lumber.

The Shimer Cutter Head eliminates this waste of time and gives it to productive work. It also insures accuracy, less spoiled material and inspires the men with the desire to do quicker work, because they can do a good job without so much care and attention to details.



The "Shimer Limited" Cutter Heads, with Expansion. Fig. 627 and Fig. 628.

For the High Speed Matcher

These heads have a chucking device which self-centres them on the spindle and grips firmly thereto when the device is drawn up, overcoming the objectionable set screw as a means of fastening the Head to the spindle. It is reliable and practically perfect in results.

The Bits carry a larger areal surface and the Bit chambers are of greater depth to compensate for the new acute angle given to the Bits for greater relief to the parts coming into contact with the lumber.

They are simple and strong throughout, have no delicate parts to break down or get out of order, and are safe and efficient tools for matching flooring, etc., at high speed.

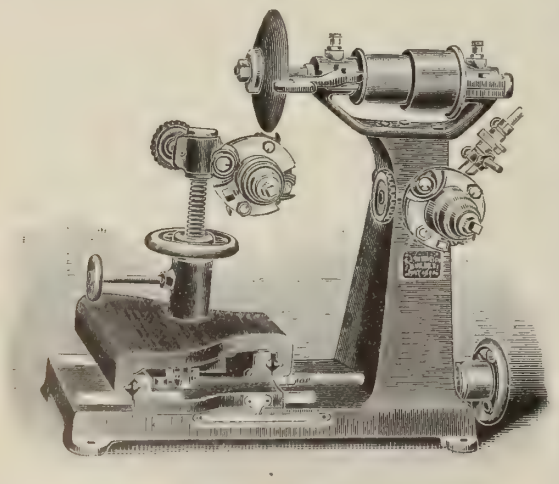
Price, net, for Flooring, $72.46 the set complete.

The Long Life Circular Bits on Shimer Cutter Heads never change when they are sharpened, and they are easily and quickly set by a guage or tracker. The bit seats having a duplex incline, pitch the Bits so that only the edges come into contact with the lumber, causing the diamond shaped point of the Bit to lead into the wood, making on easy shear or shave cut, one that will stand fast feeds without tearing out knots and splinters.

Each type of Shimer Cutter Head has been developed along the lines of durability, reliability and convenience of operation. They increase the output of any planing mill by increasing the efficiency of the men and machines.

When you buy Cutter Heads look for the SIGN OF QUALITY—our Trade Mark, "The Shimer Cutter Head," stamped on each and every Head we send out. It is not only a guarantee of quality, but a sign of the faith we have in our tools—a faith that causes us to go to the expense of making Cutter Heads to fit your machine and cut your patterns and then send them to you on 30 days trial.

We would like to have you meet us half way by sending us specifications for such Heads as you can use with profit. Put the Shimer Cutter Heads to the test. Convince yourself that they will save you money, time and labor. Do it now!



Bit Grinding Machines

For grinding Bits tempered too hard to file, and to lighten and hasten the work in the filing room, we make two styles of Grinding Machines.

No. 1 is a strong and complete machine with every needed adjustment. Price, net, with countershaft, f.o.b. Galt, Ont,, $104.00.

No. 2 machine is lighter, yet sufficiently strong to meet the average need. Price, complete, $45.50 net, f.o.b. Galt, Ontario.

Panel Raiser Heads

For $18.20 you can buy a Panel Raiser Head which will work nicely on any panel raising machine with vertical spindles. It carries a heavy shearing cut and works smoothly across end of panel as well as with the grain.

Box Board Matcher Heads

The Shimer Cutter Heads for Box Board Matching will make a uniform cut and a close fit in every instance, as well after years of use as when the Bits are new. There is no friction upon the Bits, therefore no loss of power, no waste of material. The Bits can be expanded for thicker material, with corresponding change in the thickness of the tongue and groove.
Price for two Cutter Heads with 4 Bits each, complete to match ⅜ to ½ in., $29.15. We also furnish when desired a Yoke Mandrel with self-oiling boxes, boxed f.o.b. Galt, Ontario, for $11.05.

Thin Steel Knives

made from our Bedee Brand of Steel, for planing and surfacing lumber, are recommended by users as the best that can be procured. This special self-hardening steel under our treatment is very dense in grain—strong and tenacious—well calculated to withstand the knots as well as the fibrous cross-grain which is characteristic of the lumber of some localities. They hold an edge from one to five days at a single sharpening, according to the class of lumber they are used upon. We can furnish them in any length or thickness. Write us about your requirements.

Wood Forming Cutters

We manufacture Special Cutters of any shape and size desired after the patterns of our reversible and One-Way Cutters. Let us have your specifications. For odd work not found in our catalogue send a wood sample or drawing.

The Matcher that Pays the Dividends Because of Its Efficient Operation

The topic of all planing mill conversation is the enormous saving that the new Berlin matchers are accomplishing at every installation. Reducing costs from 40% to 60% with each new machine is the verdict of nearly every user.

A saving in grades from 10% to 30% adds profits never before realized. Belt costs are cut in half and every feature of operation adds a profit that brings bigger returns than any investment you can make.

Capacity Unlimited

The capacity of a New Berlin is only limited by the ability of the operator or special feeding device. Producing high grade work at 200 to 300 lineal feet a minute is no longer impractical with our special feeding table. More time may be given in judging the grade while the feeding is taken care of automatically.

Patterns True to Standard

Profile work is done more economically on a new Berlin Matcher than by any other method. Changes from one pattern to another requires the least loss of time and besides, you have insurance against mismanufactured stock. Every pattern made today will match with that made a year hence. That's why your customer today is your customer tomorrow. Its a talking point that adds to the saleability of his stock.

Ease of Operation

Many features that heretofore required the attention of the operator are now done automatically. The slack is taken out of all belts without his attention, giving the maximum pull on both cutter and side heads with the least power expended.

All wear in cutter head and side head boxes is taken up by the new patented *automatic take-up boxes.* They never need be looked after other than oiling. They take care of themselves. And besides, you maintain a perfect cutting circle and a smooth-running head.

On the whole, every convenience for producing the highest quality has been provided for.

Up-keep Expense

Gears have always been the biggest item of expense on *any make* of machine. On the New Berlin there is *no expense* from this source. Only five gears are used in its entire make-up and placed where the least work is put upon them.

Our powerful chain drive has made this possible—a strong, effective mechanism that will outlast the life of the average machine—a demonstrated success for years at every installation.

Guaranteed Efficiency

You should judge the value of this new machine by contrast with other matchers. That's your guarantee of greatest value and assurance of highest quality to your product. The Berlin wil withstand the hardest test you can give it. You should get better acquainted with its advantages and construction

Instead of Repairing That Old Belt Buy a

VI-BALATA

Vast improvements have been made in recent years in the manufacture of Balata belting. No old belt however good or however well repaired could possibly give as much satisfaction as a new one of more recent manufacture.

Vi-BALATA Belting embodies every improvement of importance that has ever been made in Balata Belting—it is the evolution of scientific experiment—the finished and perfect product of the most modern and complete process.

Vi-Balata Belting is preminently the most suitable for outdoor work or in any place where it is impossible to keep the belt dry it is absolutely waterproot and stretchless.

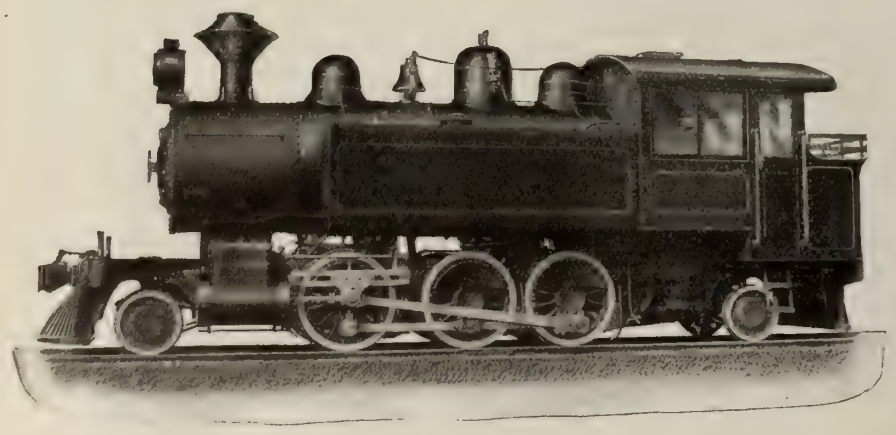
SELECTION OF LOCOMOTIVES

WHAT SHOULD BE KNOWN BEFORE YOU PURCHASE LOCOMOTIVES:—



Nature of the service.
Capacity of the cars and weight of train.
Character of track—is it new or old.
Length of haul.
Is time an important factor.
Do you want a quick locomotive or a big puller.
Distance from base of supplies and quarters for the men.
Water and coal carrying capacity.
All these items and more should be considered.
A careful study of conditions may mean larger profits.
Our experience may be valuable in considering them.
A dollar saved is more than a dollar earned.

Write or wire us, or better still, come to see us.

Dominion Express Building, MONTREAL, CANADA

Makes It's Mark Vivid and Lasting

Marks that remain vivid and wear like iron are a real satisfaction to the man who handles lumber. The metallic pigments, like graphite, of DIXON'S LUMBER CRAYONS offer marvelous resistance to all kinds of weather conditions. Their marks are often visible after six months of severe exposure to sun and storms.

DIXON'S LUMBER CRAYONS

have always remained the recognized standard because of their one, uniform and dependable quality; their convenient and uniform shape and size and because of the careful selection of materials used in their manufacture. DIXON'S LUMBER CRAYONS are made in nineteen grades and colors, including black (six grades), red (two grades), blue (two grades), green, white, yellow, brown, terra cotta, violet, pink and orange. Some are made to fill particular needs—let us tell you more about them. Get acquainted.

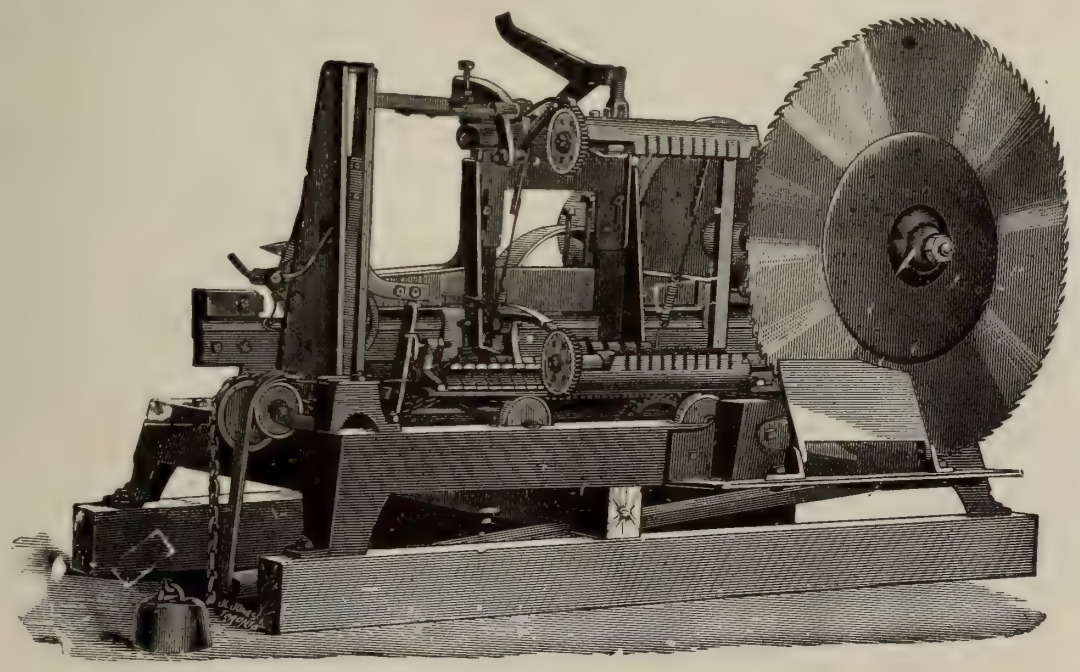
Mowry's Boss Shingle Machine



THIS MACHINE IS ONE OF THE BEST SINGLE BLOCK SHINGLE MACHINES MADE IN CANADA. Wherever introduced it has taken the place of all other shingle block machines. It is perfectly automatic in its action. The stroke is never longer than the cut, thus saving an immense amount of time, and by the touch of a lever the operator can make the machine butt all at one end, so as to bring the knots all at the thin edge. A patent brake relieves the machine of all jar when the carriage is stopped to change blocks. It has a powerful friction feed. It is altogether the simplest in construction of any machine built and combines so many advantages that it is far superior to any machine on the market. We build shingle machines both horizontal and vertical. SIMPLE. CHEAP. DURABLE. If you want a good shingle machine try the "Boss" and you will be more than pleased. One 40 inch saw and one 24 inch collar with each machine.

We also Manufacture all kinds of High Grade Machinery for Saw and Shingle Mills. Write for Prices

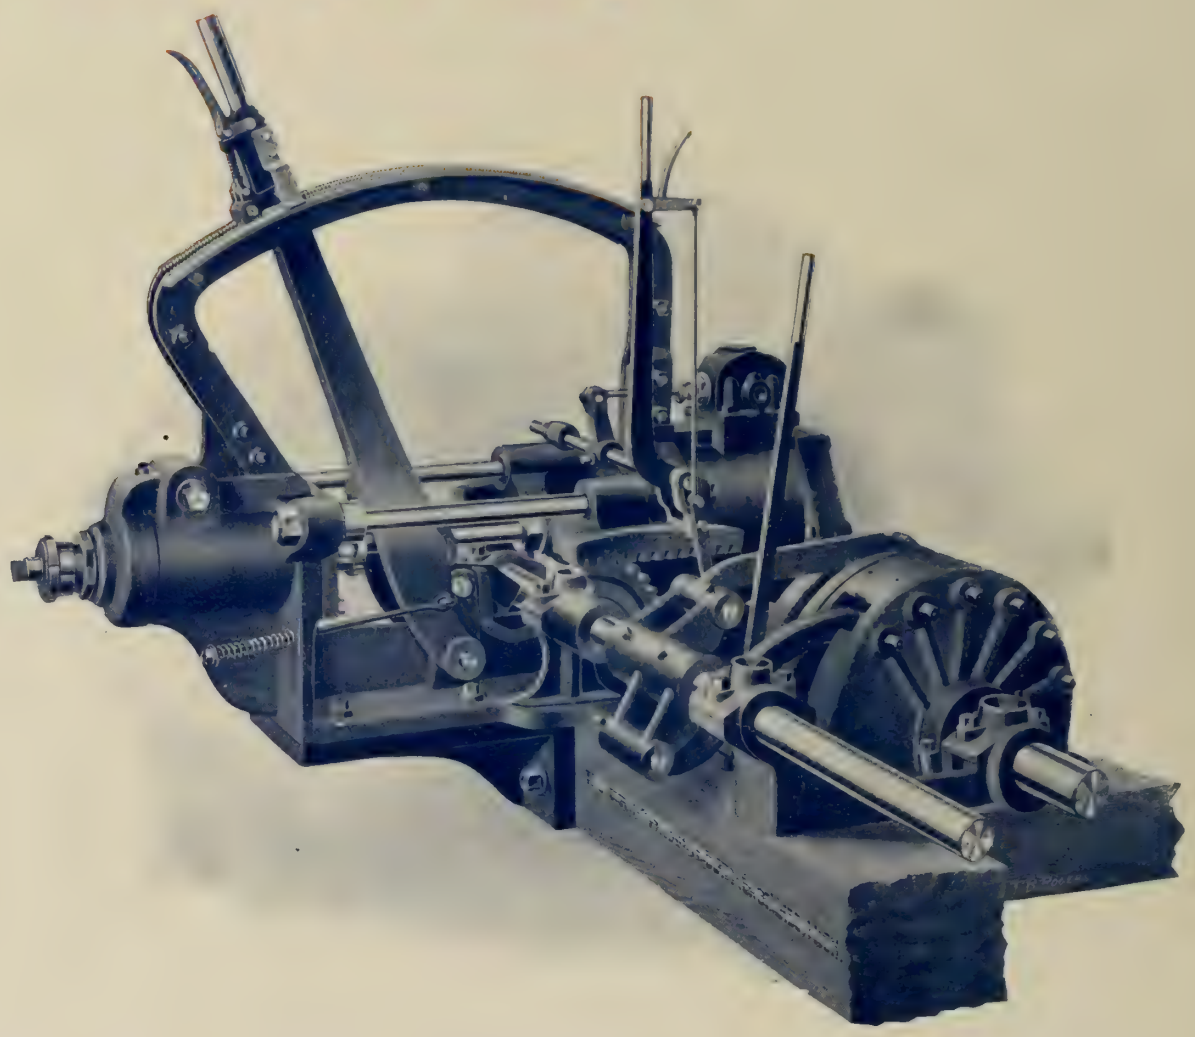
Canada Lumberman and Wood-Worker

ANNUAL and CAMP SUPPLY NUMBER 1912

Toronto, September 1, 1912 Hugh C. MacLean, Limited, Publishers Vol. 32. No. 17

Did you ever really figure what it means to you to increase your cut 2,000 feet per day?



That is, increase it 2,000 feet per day without adding to your cost of sawing.

Or, in other words, what effect will it have on your profits if you can distribute your overhead charges and wages over an output 2,000 feet per day greater than it is now?

If you haven't figured it out, take your pencil and try it now.

You know how much it costs you to run your mill every day—divide that amount by the number of thousand feet per day in your present output—add 2,000 feet to your present output and divide your daily cost by that amount—and the difference between the two results represents the saving per thousand feet in your operating cost.

Then multiply that figure by your total output per season—and we think the result will surprise you, if you have never looked into this before.

This is just one of the ways in which our FOUR INCH STEAM SET WORKS will make money for you, and it will do just this because the users themselves have written us stating that they have increased their cut ***upwards*** of 2,000 feet per day.

May we send you further information about this Steam Set works?

William Hamilton Company, Limited

PETERBOROUGH - ONTARIO

YARD VIEW AT OUR MILLS, CACHE BAY, ONT.

CHOICE PINE

Lumber buyers who come face to face with the consuming public are to-day experiencing a demand for quality products that we anticipated a good many years ago.

Our first move in the production of Pine Lumber was the acquisition of a good supply of timber—not only a good quantity, but particularly a good quality, and the best proof we can offer you of our success in the selection of this kind of timber is found to-day in our

Norway or White Pine Lumber, Railroad and Structural Timbers, Flooring, Ceiling, Moulding, Siding, Cross-arms, etc.

Daily Capacity of Mill 190,000 feet of lumber, 65,000 pieces of lath, exclusive box boards and pickets.

George Gordon & Company

Limited

CACHE BAY - - ONTARIO

Boost Your Profits With These Grades of Lumber

THERE is a constant, never-ceasing demand for lumber of known quality, that stands up under the most trying conditions and that gives the best value for the money. You can find no better or more economical grades than the

WHITE PINE
QUEBEC SPRUCE
AND HEMLOCK

supplied by this firm. We have filled many orders since spring in these lines and in every instance they have given the utmost satisfaction.

It is our endeavor at all times to give prompt shipments and you are thus assured of the quickest possible deliveries.

You are also assured of a wide margin of profit because we always quote the lowest market prices.

Your own eyes will convince you of the fine quality of our lumber—let us fill just one order for you and you'll be ready next time with fore-knowledge of where you can get the best values and quickest shipments.

We have never forgotten the old adage about the satisfied customer—that's why we have yet to hear of a dissatisfied one.

There's money in the grades mentioned above—don't you want some of it ?

Timber Limits for Sale on Georgian Bay

The undersigned offer for sale in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; Tug Scow and other Lumber Equipment, including boom chains, plows, sleighs, etc.

The Limits, part of which have recently been sold, include: 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, $1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

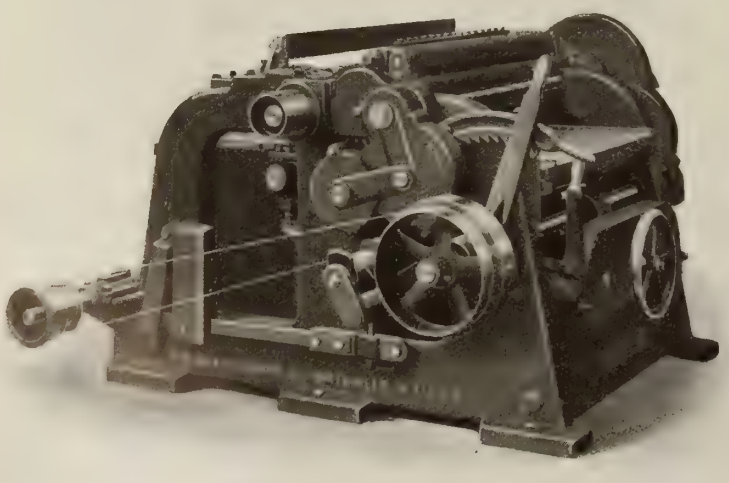
SMITH OF SMITHVILLE

Woodworking Machinery

The **New Cabinet Planer** is fitted with **Round 4-knife Head** and **Self-hardening Cutters** also with **Sectional Feed Rolls** and **Sectional Chipbreakers.**

These machines are made in three sizes, viz: 30, 36 and 42 inches wide, and will plane stock as thick as 7 inches.

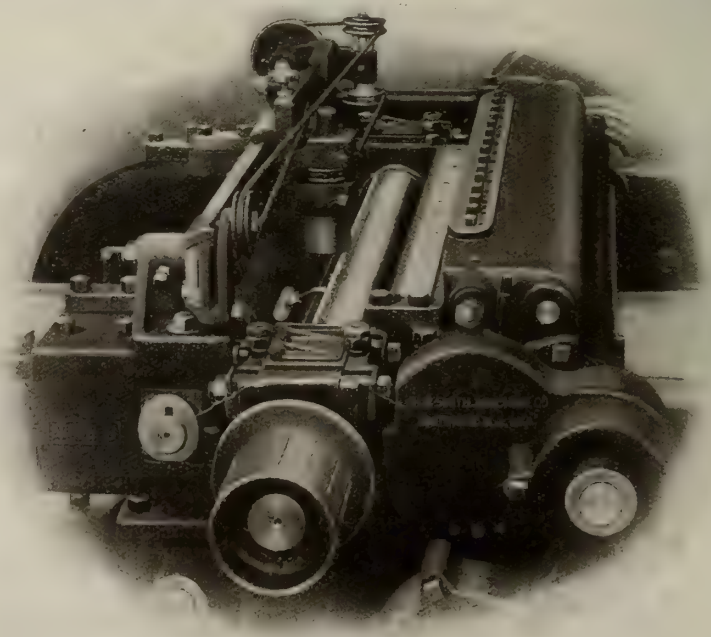


Work-side of New Cabinet Planer

The knives are jointed on the machine so that **all** will cut, and they are ground by the grinding attachment shown annexed.

For full particulars concerning above and more than 150 other Woodworking Machines address;

H. B. Smith Company, Smithville, N. J., U. S. A.
New York, Chicago, Atlanta, San Francisco



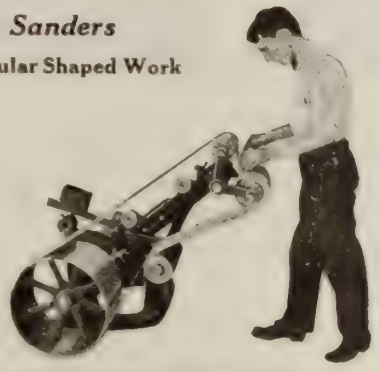
Showing Grinding Attachment and Device for holding the Head while grinding to proper cutting angle after being jointed.

No. 111 Pneumatic Roll Sander

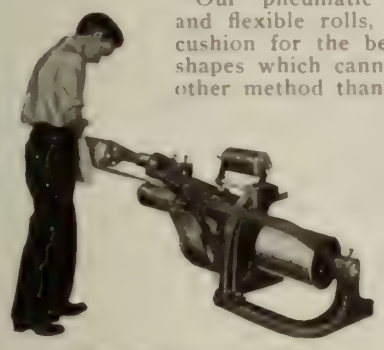
Most Universal of Belt Sanders

Handles an Unlimited Variety of Irregular Shaped Work

The newest wrinkle in sanding machinery, embodying a principle of great value and usefulness in wood finishing, which gives it an adaptability and effectiveness unapproached by any other machine of this type. Extended tests in the largest woodworking factories in the country, clearly show that in actual service it has set a new standard of speed and economy in sanding difficult work of every sort, much of it that no other machine can do at all



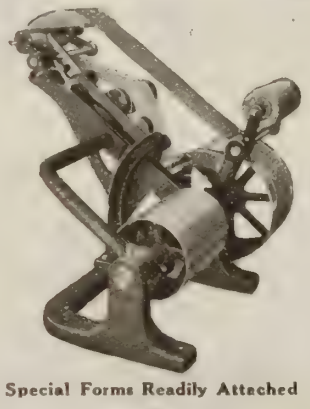
Sanding a Cross Veneered Swell Drawer Front



Using the Pneumatic Roll

Our pneumatic roll is different from other drums and flexible rolls, the air forming a true and yielding cushion for the belt, permitting it to adapt itself to shapes which cannot be sucessfully sanded by any other method than hand work. Lightly inflated, the pneumatic roll conforms to any rounded or oval shape; fully inflated, it forms a barrel-shaped cushion for sanding concave surfaces. In either case it takes the vibration from the operator's hands, enabling him to handle work more easily and therefore more rapidly. Using a long sand belt, in place of tubes or sleeves of sandpaper, is another advantage.

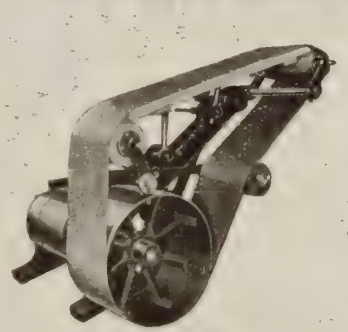
For Sanding Irregular Shapes



Special Forms Readily Attached

Such as table legs, either flat, oval, straight or curved, cross-veneered, swell or serpentine drawer fronts, shelves for cabinets, claw legs, rounded-over toilet frames, veneered posts, chair seats and backs, cross veneered O. G. mouldings, half or quarter round mouldings, mirror frames and standards, closet seats and covers, moulded arms, or in fact anything that can be easily handled, it is unequalled in the perfection of its work, in its convenience for the operator, and in its capacity.

The Main Idea in the Machine Itself



Flat Table in Position

has been to make it thoroughly convenient to work at. In this important respect it is superior to any other belt sander. And the construction is equal to the design. The main column or arm, which is adjustable to any position, is rigidly braced, and hinged on sleeves independent of the shaft. The rolls and drum all run in ball bearings. The travel of the sand belt is instantly reversible, so operator can use either the upper or under side of the drum, have the belt run from him and always sand with the grain.

This Advertisment Should Interest Every Man Who Uses Belting

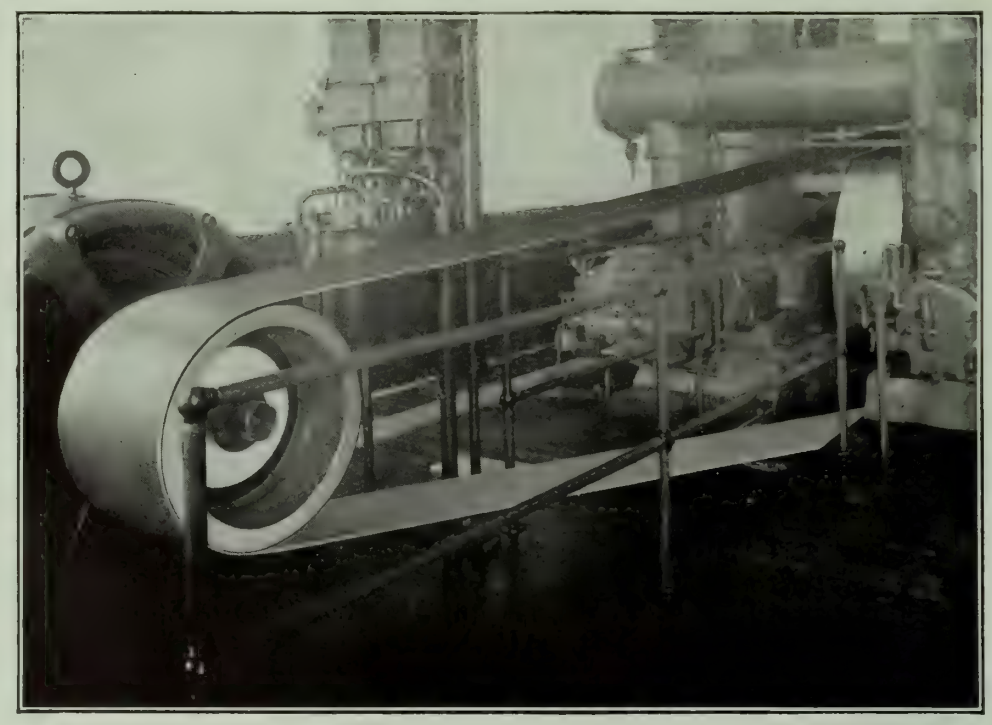
SCANDINAVIA BELTING — FEDERAL ENGINEERING & SUPPLIES LTD. TORONTO

SCANDINAVIA BELTING — FEDERAL ENGINEERING & SUPPLIES LTD. TORONTO

ON ALL your direct drives whether straight or crossed, it will pay you to use Scandinavia Belt. Scandinavia Belt has a good surface for gripping the pulley, its tensile strength is enormous. It runs true. It can be used in either a wet or a dry place. (We do not however recommend it for places where the conditions are alternately wet and dry).

It runs exceptionally straight on the pulleys. Scandinavia Belting will save you money in both the first cost and in the maintenance.

For drives where the conditions of moisture are constantly changing from wet to dry, we recommend our Lanco Balata Belting to which we call your attention below.



TRADE MARK LANCO BALATA BELTING

TRADE MARK LANCO BALATA BELTING

Lanco Balata Belting can be used under almost any conditions except those of heat. This belt is made of 38 oz. duck, woven as tightly as it is possible to weave it, and is then well filled with a Balata solution, and heavily callendered. It is stretched in the process of making, and after being filled with the Balata solution, does not "go back." Lanco Balata Belt is as nearly stretchless as it is possible to make a belt, the maximum stretch being about three quarters of an inch in ten feet.

We carry a large stock of both Lanco Balata and Scandinavia Belting in Toronto and Montreal.

Our Balata Belts can be made endless on short notice.

We have issued some very handsome bulletins on both the above belts, and would be very pleased to send either or both to you on application.

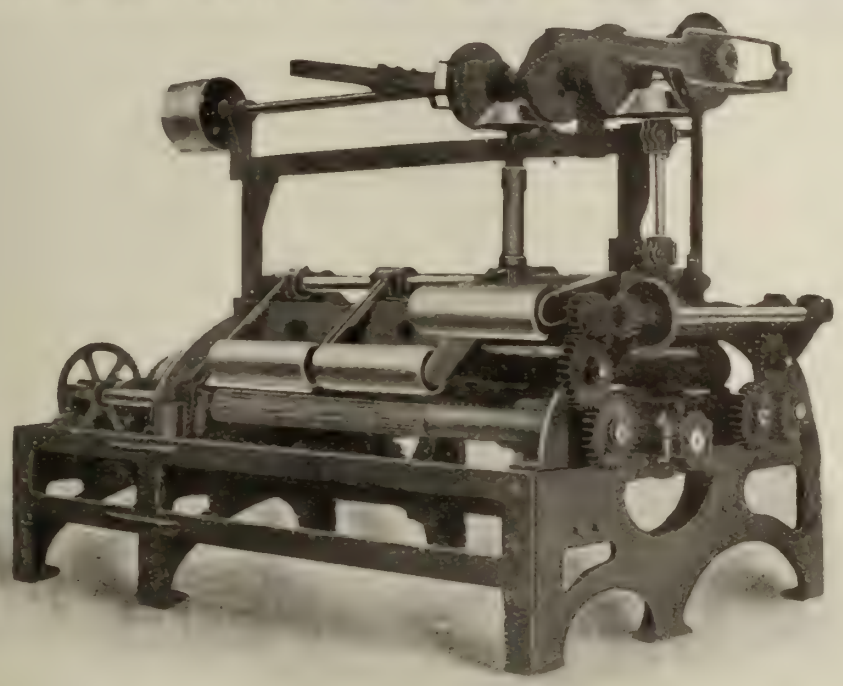
Saw Mill Machinery

For Good Saw, Lath and Shingle Mill Machinery come to Gravenhurst, Ontario, where we have designed it for nearly 50 years



"Jumbo" Combined Gang and Edger

This is a very complete machine and embodies every detail of construction essential to an adequate gang edger. ¶ We have some very flattering testimonials for our "JUMBO."

Mandrel: 4½ inches by 10 feet 6 inches long.

Drive Pulley: 20 inches 20 inches.

Saws: 2 movable saws on edger side (more if desired) 8 stationary saws on gang side, 2 water boxes.

Our latest model is an improvement on the one illustrated here

Let us quote you when you are in the market for Saw, Lath or Shingle Mill Machinery or Repairs

Mowry's Improved Silent Set Works

A new patented machine which discounts anything of the kind now on the market. Strong, compact and accurate. No ratchets, no noise, no lost motion. Grip is positive. Oil or water will not effect. Can be placed on any carriage. Will last a lifetime. Low in price Recommended by many millmen now using them.

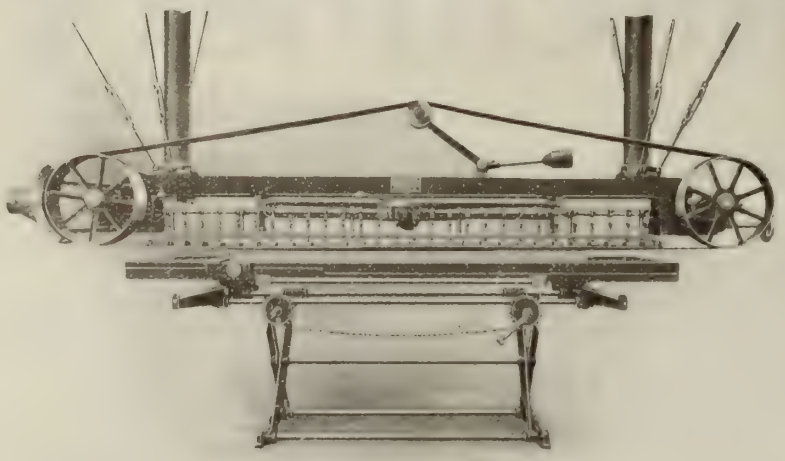
We are confident these Set Works will give satisfaction, and we will send them to any responsible party on 30 days trial, and we will assume the responsibility.

Write for prices. Send size of set shaft and say whether right or left hand carriage.

Mowry & Sons

Gravenhurst, Ontario

The Schimmel Spiral Belt Sander



Suspended Model—Made also in 6′ and 8′ Standard Models.

This machine is designed for the rapid and economical sanding of all surfaces whether flat, curved, or irregular. It will replace six to eight men sanding by hand, and produce a surface superior to hand finish. In sash and door, interior finish, bank and office fixture concerns, it will earn back its initial cost in sixty to ninety days. Installed in the majority of up-to-date wood-working factories in the United States. Over fifty at work in the Dominion.

You cannot afford to be without this master machine.

Butterworth Foundry, Limited Ottawa, Canada.

A Belt which Conveys ALL the Power

Practical men know the drainage of power from a slipping belt, ***and because they know,*** they are buying

GOODYEAR RUBBER BELTING

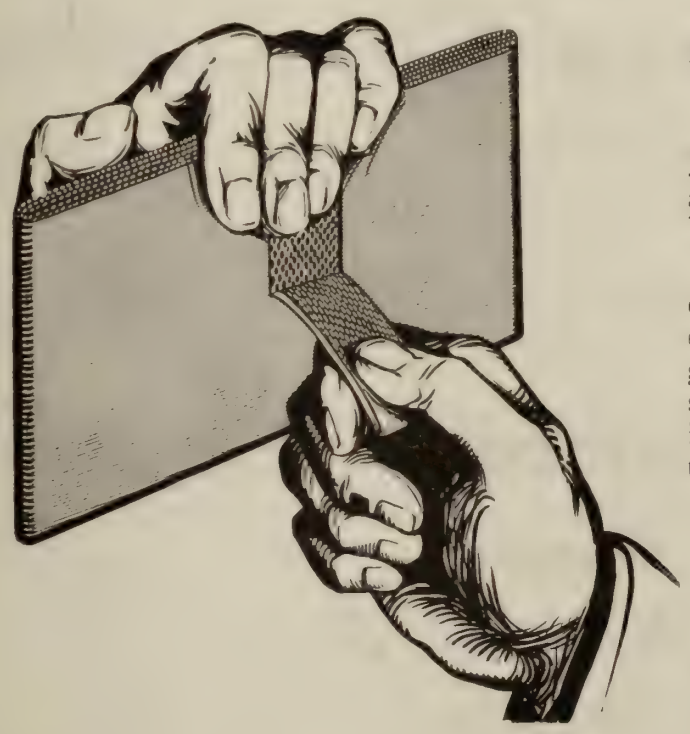
Which Neither Slips Nor Stretches

It is built up, layer upon layer, of close-woven, long-fibre, cotton fabric, rubberized and cured under Goodyear processes. And every Goodyear belt has in it the lowest possible minimum of stretch, because the belt is "cured" whilst stretched to the limit of safety in a special machine.

That is the Goodyear Method of Belt Manufacture

And the result is entirely satisfactory to belt users—a fact to which our enormously increased sales testify. What is the significance of this CONTINUED SALES INCREASE — 50% over last year? Simply that Goodyear Belting more than fulfills the claims made for it by the Goodyear people—who know what a belt should do, and make a belt to do it.

It has cost us less than $200.00 for claims or adjustment of every kind in connection with our total output for the past two years—a remarkable tribute to Goodyear reliability.



Look into the Belt for Yourself—Try to Tear It Apart.

Make a cut in the top layer—and then try to pull it apart. You will get a faint idea of its strength.

That is the result of forcing rubber at tremendous pressure through the fine cotton fabric—separating every strand—thus abolishing all internal friction or grinding. Whilst these layers of fabric are afterwards so compressed as to be almost homogeneous, the finished belt bends easily, the "duck" being so woven as to retain complete pliability in the finished belt.

For Main Drives and High Speed Pulleys GOODYEAR Belting is the Best

It has all the tensile strength necessary to absorb tremendous strain without slip, stretch or rent. The grip of rubber and the prodigious strength of hard-twist cotton fabric are united, and prove equal to every emergency.

Where the power transmitted is high, and great tensile strength is essential, Goodyear Rubber Belting proves its worth.

EVERY GOODYEAR BELT IS SUBJECTED TO A STRINGENT TEST BEFORE LEAVING THE FACTORY, and what is more, the materials used in the manufacture are also tested in the Goodyear laboratory before using.

IF YOU USE A BELT AT ALL IT WILL PAY YOU TO USE A GOODYEAR

Loss of power is loss of profit—and an inferior belt is dropping power all the time. Goodyear belting quickly earns its cost in power saved and trouble avoided.

TWO HUNDRED AND FORTY ROLLS—A TOTAL OF 72,000 FEET

We have just received an order for this quantity of GOODYEAR RUBBER BELTING from one business concern in the west, for the equipment of interior elevators. Such an order shows supreme confidence in the quality of GOODYEAR Belting.
If we have not just the belt you require we will make it for you.
In the choosing of belts our booklet would be of great assistance to you. We supply it free. Write to our nearest Branch for one.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 32 Toronto, September 1, 1912 No. 17

The Annual Issue

In the business world one of the most important and at the same time troublesome events is the annual taking of stock. In one form or another this comes up in practically every class of business. It is the great event which brings into the light of day the results of the years' purchases and sales. It shows more clearly even than financial statements, just where money has been wasted and where it has been made, and it gives those who study its lessons, suggestions of inestimable value for their future guidance. The stock in trade of a journal, so far as its editorial work is concerned, is the good will and co-operation of its readers and friends. That is what it buys by its efforts, and the payment it makes in return is the reading matter which it presents in its columns. The annual stock taking of the commercial world resembles in a measure the annual issue of a trade journal. The present issue of the Canada Lumberman and Woodworker may be considered as representing the results of our annual editorial stock-taking. It shows us and our individual readers the amount of interest which is taken in the Canada Lumberman by the members of the great lumbering industry. At the same time it reflects the developments which have been made during the past year and those which are now in progress. In much the same manner the advertising in this issue shows the results of the interest and co-operation of those who make use of our facilities for publicity. The advertising pages tell their individual stories of important productions in all branches of the trade and they tell the great collective story of the progress which has been made in the manufacturing of many kinds of forest products and the production of wonderful machinery for the lumbering, woodworking, pulpwood and allied industries.

Bearing this general explanation of our annual issue in mind, no further definition of its aims and objects is necessary, beyond saying that it has been our effort to produce a magazine which will give our readers much to study and enjoy, and to encourage them to co-operate with us in the future, even to a greater extent than they have in the past; for, upon their co-operation depends more largely than they can appreciate, the success of our efforts to furnish them with a magazine which is thoroughly representative of lumbering and its allied industries.

For the interest which our readers and advertisers have always taken in the Canada Lumberman we have the utmost gratitude and we live and work in the hope that we may deserve this interest more and more in the future.

As to the contents of the present issue from an editorial point of view, several features, we believe, will stand out prominently. Perhaps the most noticeable of these is the fact that the pulpwood, pulp and paper industries bulk more largely than in former years. No apology is needed for this. It is the logical result of natural developments. Out of the old-established lumbering industry there has sprung up in recent years, a great new industry which promises to make Canada the largest producer of pulpwood, pulp and paper in the world. The last year has seen almost incredible strides in this direction and the coming year promises to show even greater developments. Our position as a pulpwood producing country has become established. As a pulp producing country we are now attracting the attention of the world. The progress of events has been the usual one in a new industry. First of all we produced the raw material, pulpwood. Then capital commenced to come our way for the working up of the raw material into a more finished article. Finally, we see to-day, the first stages of the complete development of our natural resources, viz., the establishing of mills for the production of paper. At first we were anxious lest our raw material should be exploited solely for the benefit of the manufacturing industry in foreign countries. The economic laws of supply and demand, however, have worked in our favor and to-day we find Canada, by reason of its pulpwood resources and its wealth of water power, coming steadily to the front as a producer of the finished article, paper. Under such conditions, those engaged in the lumbering industry have naturally taken a great interest in these new developments and in a great many cases have taken their part in bringing them about. Readers of the Canada Lumberman will therefore unquestionably be keenly interested in the articles appearing in this issue which deal with the surprising growth of the pulpwood, pulp and paper industries of Canada.

In addition to the above features the present issue contains a wide variety of articles dealing with the progress of the lumbering industry in many parts of Canada. It has been our particular effort to present in these pages, articles contributed by representative men in the industry, men who have made a special study of the particular subjects regarding which they write. Several articles of this class appear and the information which they contain can be accepted by readers as the result of long experience and careful study.

From all our readers, of every class, we bespeak a conscientious study of the advertising pages of the present issue. They will find in these pages the concrete results of the life work of scores of successful business men. The arguments, the facts and the figures presented in our advertising pages are the serious and sober expression of the convictions of men of worth. Every advertisement carries an all-important message to its own group of readers. No one who is connected with the lumbering industry or any of its allied industries can afford to lay aside this annual issue without having searched the advertising pages closely for information of special importance to their work.

Considerable discussion has recently taken place in British Columbia regarding a proposition for the establishment of a chair of logging engineering at the new British Columbia University which is to be located at Vancouver, B.C. The "Timberman" of Portland, Ore., has actively espoused the proposal and has received the assurance of the Premier of British Columbia, Sir Richard McBride, that he will have the matter fully considered. British Columbia with its wonderful timber resources would be a most fitting province to take such an important step in the direction of developing a body of trained forest and logging engineers.

Sorting and Rafting on the Restigouche

Over a Hundred Million Feet of Logs Handled During the Year—Methods Used by One of New Brunswick's Driving and Boom Co's.

The Boom Crew—During Lunch Hour

Making the Rafts—A Section Nearly Completed

LUMBERMEN in Canada are familiar with the usual methods of log driving and understand the difficulties which have to be overcome annually when the logs are transported by water from the woods to the mill. The methods of log driving, however, vary greatly according to the nature of the country, the size and extent of the timber and the nature of the water by which the drive has to be made.

In some parts of Canada it happens that a large number of lumbermen are operating in a district which is contiguous to a large system of waterways and that they find it to their advantage to co-operate for the purpose of conducting their log-driving operations. This is the case particularly in Ontario and New Brunswick. Each of these co-operative driving operations has its own peculiarities. Readers of the Canada Lumberman are already familiar with the methods used by the Spanish River Boom Company, and by the St. John River Log Driving Company. We are fortunate in being able to supplement the articles which have already appeared regarding these two companies with a description of the operations of the Restigouche Log Driving and Boom Company, whose headquarters are at Campbellton, N.B. The Restigouche is a large river emptying into the Bay of Chaleur and for some distance forming the boundary between the Province of New Brunswick and Bonaventure County, Quebec.

The Restigouche Log Driving and Boom Company take charge of the logs belonging to their members when they reach the mouth of the Kedgewick River, a branch running into the Restigouche. From that point the logs are driven to the boom limits a distance of 65 miles. The logs have to be taken at a certain date each year, about the first of June.

Generally speaking there are two chief operations in connection with the Restigouche Company's work. The first of these is the driving of the logs to the company's booms and the second is the sorting and rafting so that the logs of each individual owner can be towed away in rafts to the mills. The driving of the logs on the 65-mile stretch from the Kedgewick to the boom limits would be a fairly simple matter were it not for the tendency which the logs have to make for the shore and take a rest on the banks of the river adjoining the private property of the farmers and others whose rights upon the river banks must be respected. Moreover, it is to the advantage of the company to keep the logs continually on the move. For this purpose they have installed what are konwn as sheer booms along the shores of the river where the logs have a tendency to stick. These sheer booms extend from Matapedia down the river a distance of twelve miles, and are fastened by piers. The down-stream end hangs free, with adjustable wings which may be made to project out into the stream at any desired angle. The angle of the wing regulates the direction taken by the logs as they float down the river.

Sorting and Rafting the Logs

After the logs have been sheered into the receiving booms the rafters take hold of them. The logs are drawn up alongside of one another and riders are put on top of them. Then other logs are pulled up so as to overlap the ends of those already arranged and riders are placed on top of them, the process continuing until a sufficient number have been secured together to form a raft. The sorting of the logs before they are made into rafts takes place in much the same manner as in other booming operations. A central channel is boomed off and the logs are drawn from this channel into side pockets, each pocket containing the logs of a particular owner.

Making the Rafts—Drawing up the Logs

Making the Rafts—Ready for the Riders

The logs are identified by the sorters according to the marks which have been put on them by the loggers in the woods during the winter.

The rafting operations are carried on on both sides of the river a few miles above Campbellton. The boom on the south side of the river has been in operation for about thirty-five or forty years. The work at this point was first organized by David Richards, under whose direction it was developed into a most efficient work. The boom on the north side of the river has been in operation only since the beginning of 1911, but it has already proved very useful.

Two years ago the company was organized and secured a Dominion charter. As the river forms the boundary between the two provinces, a Dominion charter was essential. The members of the company are as follows: Richards Manufacturing Company, Campbellton, N.B.; Shives Lumber Company, Limited, Campbellton, N.B.; Dalhousie Lumber Company, Dalhousie, N.B.; Chaleur Bay Mills, Chaleur Bay, N.B.; W. H. Miller, Campbellton; B. A. Mowat, Campbellton, and the Sydney Lumber Company, Dalhousie, N.B. Each of these companies has a voice in the management of the Restigouche Log Driving and Boom Company, and they are permitted to vote by proxy through other members of the company. Each member has one vote for every hundred thousand superficial feet of logs handled for him by the company. The business affairs are managed by a board of directors chosen from the companies which are members of the boom company. Five members are appointed annually and they hold office until the next annual meeting of the company.

The Financial End of the Work

The principal object of the company from a financial point of view is to conduct the driving, sorting and rafting operations as cheaply as possible, without considering the making of dividends. The charges for the services of the company are regulated by a vote of the board of directors. At the meeting which was held on March 26th of the present year, the following rates were adopted for rafting: merchantable spruce or pine, 55 cents per thousand; undersized, 65 cents per thousand; cedar 60 cents per thousand. The charges for driving were fixed at the same meeting at 18 cents per thousand from the mouth of the Kedgewick to the boom limits and a graduated scale for other points nearer the boom limits, the charge for driving from the mouth of the Matapedia to the boom limits being four cents per thousand.

The directors for the present year are as follows: D. E. Richards, president; A. H. Hilyard, D. Champeau, W. H. Miller, W. F. Napier, and M. A. Kelly, secretary.

The operations of the company for the present year are expected to result in the driving and sorting of 108,000,000 feet. Last year the total was about 97,000,000 feet. In 1910 the total was nearly 92,000,000 feet, and in 1909, 81,000,000 feet. The estimated value of the company's plant on the south shore is $49,362, and of the plant on the north shore $63,059. During the year 1911 the expenses of operating were as follows: Driving, $14,647.71; rafting, $45,757.30; total, $60,405.01.

A week's operations result in the rafting of about 7,000,000 feet. During the week ending June 22, for instance; the average daily quantity rafted was 636,333 superficial feet, on one side of the river, making a total for the one side during the week, of 3,818,000 feet. The two sides therefore rafted about 7,000,000 feet in a week or about 12,996 logs per day.

The Employees and Their Work

About fifty-five men are employed on each side of the river on the work of sorting and rafting. They are all boarded on the company's premises in large boarding houses situated near the booms. The camp on the south side of the river includes two cook houses and two sleep houses. The hours of work are regulated by the tides, and as a rule amount to something over ten hours per day. The operations are carried on from the middle of May until about the first of November. One man is in charge of the whole operation at both booms and about five men on each side of the river occupy positions as foremen. These men are actually engaged in the sorting and rafting work, but they have supervision of the various gangs. The wages of the men vary from $1.75 to $4.00 per day, being graded according to the skill required for their work. One cook and three assistants are employed in the work of furnishing meals for the men. The employees are given an excellent variety of foods. Their work is so arduous and long that only by furnishing them with good and palatable food can they be counted upon to do their work effectively. Fresh meat, eggs, butter, bread, milk, rhubarb and seasonable fruits are secured from the farmers round about. Provisions for the men upon the north side of the river are all secured from Quebec farmers. On the south side of the river it is necessary to import a good deal of the fresh foods from other provinces.

The men who are engaed in the sorting and rafting spend practically the whole of the year in the lumber business. As soon as the work upon the river is finished they find employment in the winter camps where the logs are cut. Many of the men employed by the Restigouche Log Driving & Boom Company come from the Miramichi district, it being a difficult matter to obtain from the camps of the Restigouche district, men who are skilled in the work of sorting and rafting.

The up-keep of the booms is a matter of considerable expense. A staff of men are employed all the year round making repairs on the booms, and placing new booms and new piers.

For thirty years Mr. H. D. Sheals occupied the position of foreman and general manager at the booms. Mr. Sheals is now fifty-five years of age and he retired at the beginning of the present season. His successor, David Smith, is a man of many years' experience in the woods and on the rivers. He comes from the Miramichi district and had the benefit of being associated with the retired foreman for a number of years.

When the rafts have been formed they are towed away by the companies to whom they belong. The Restigouche Log Driving & Boom Company own a couple of tugs which they use for work around the booms. Each of the sawmilling companies also has its own tugs for the purpose of towing away the rafts. The rafts vary in size from 5,000 to 14,000 feet.

The work of the men at the booms commences early in the morning. They have breakfast at 6 o'clock and then proceed to the river. At eleven o'clock they come in for dinner. Then they go back to their work till 4 o'clock, when they come in for tea. Another period of work then takes place until 7 o'clock, when the men come in for their supper. These hours of course are varied from time to time, according to the tides.

It happens each year that a number of logs coming into the company's booms have not been marked in the woods and it is impossible therefore to tell to whom they belong. These "no mark" logs, as they are called, are sold by public auction on the first of June of each year, and the proceeds are divided among the different members of the company in proportion to the size of their cut.

The above facts give an idea of the magnitude of the work involved in sorting and rafting the Restigouche logs. Like all statistics however, they fail to give an idea of the picturesque nature of the work. The accompanying illustrations overcome this deficiency to some extent, but it is only by a personal visit to the work that one can gain anything like an adequate conception of the unique and extensive character of the operations.

New Brunswick's Surveyor General

Hon. J. K. Fleming

Hon. J. K. Fleming, Premier of New Brunswick, who is also in charge of the Crown Land Department and therefore responsible for the administration of the forest resources of the province was born in Woodstock, New Brunswick, in April 1868. He was educated in the Common schools of New Brunswick, attended the Provincial Normal School and for a short time was engaged in school teaching. After this, he found his way into mercantile life by securing a position with a firm of lumber manufacturers and dealers. In 1895 Mr. Fleming made his first entry in politics being nominated in that year to represent Carleton county in the legislature. He was also nominated in 1899, but on both occasions he was defeated. In the by-election of 1900 he was more successful, being then elected, and at subsequent elections in 1903 and 1908 he was again victorious at the polls.

In the year 1908, when the Robinson government was defeated, Mr. Fleming became Provincial Secretary in the Hazen administration, a position which he occupied until October 1911, when Mr. Hazen retired from provincial politics to become Minister of Marine and Fisheries in the Dominion Government. Upon that occasion Mr. Fleming succeeded him as Premier and Surveyor General. In the election of June last, Mr. Fleming's government was sustained and accordingly he is to-day in charge of the same department as formerly.

The Crown Land Department of New Brunswick has made an excellent financial showing during the last three years. Its revenue from Crown Lands in 1907 was $321,000. In 1911, the total was $528,000. The Department is one of the most important and busy of the executive branches of the government. It handles not only administration of the timber lands of the province but is charged also with the management of the provincial business connected with mines and mining, game protection, fisheries and fish protection.

Nova Scotia's Domestic Use of Wood

Annual Consumption Amounting to over One Hundred Million Feet—Interesting Details of Industrial Disposition of the Product

Written specially for the Canada Lumberman, by J. B. Whitman, Deputy Commissioner of Crown Lands

To give the exact quantity of native timber and lumber of all kinds used in Nova Scotia in this year of grace 1912, may look to be a very simple matter, but when we take into consideration the various industries that use timber, we are at once confronted with a task that is difficult to accomplish; so much so, that along some lines we can only hazard an extravagant guess. Reasoning, however, from figures known to be correct and from facts absolutely certain, what at first might appear to be only a guess, turns out to be approximately correct.

The entire absence of any record or note being made by the ordinary man as to whether he uses one thousand feet or two thousand feet of lumber in any one year, is the first point of difficulty and the next point is the impossibility of collecting the information. This can only be done by the census man.

The principal domestic use of native timber and lumber is for mining, building, manufactures of wood, barrels and boxes for fruit and fish, and wood for railway maintenance. In addition to this there is a large quantity used for fuel and farm fencing.

In the case of timber used for mining, most of the mines report the quantity as well as the various kinds and sizes that are used and in this way it is possible to get a close approximation of the total.

Forty Million Feet Used in Mines

The quantities contained in the report of the Department of Mines are chiefly if not wholly used in the mining of coal but the writer has been able to get reports of quantities used in many of the mining operations carried on in the province, in mines other than coal. As a very large quantity of the timber used in mining and especially in mining coal is small and is used in its round state, the measurements are given in solid or cubic feet. By following up the various sources of information, it appears that there is now used annually for mining of all kinds of mineral about six and one-quarter millions of cubic feet of small timber, mostly round. This is made up of pit props, ties and booms. A cubic foot of wood should make twelve square feet an inch thick or as it is called superficial feet or board measure, but on account of waste in sawing round timber and also on account of what goes into sawdust, a cubic foot of round timber means, according to circumstance, six or seven feet board measure. Then the quantity of small timber used in mining represents if it were sawn into lumber, something like forty millions of superficial feet.

This quantity represents approximately what can be grown under favorable conditions on forty-five thousand acres, but according to present conditions of cutting and waste, and making allowance for waste portions in any large area of land, it may mean the production of nearly one hundred thousand acres.

It has been impossible to ascertain the quantity of sawn lumber used for mining, but from accurate reports of some of the mines there is good reason for believing that the quantity is more than two million superficial feet.

These figures are open to question and may be quite far from right either way, but if in error are probably too small.

It is interesting to note that if the pit props used in mining in Nova Scotia in one year were placed end to end they would reach a distance of more than three thousand miles.

Building Operations Responsible for Heavy Consumption

To get at the total quantity used in building is absolutely impossible, except by census methods, but by securing accurate knowledge in a few isolated cases, it will perhaps be amusing, if not interesting, to reason along certain lines sufficiently to assume a total quantity. A firm of builders and contractors in a certain town of one thousand people (the census of 1911 says 1,000), used in the year a little over one million feet of native sawn lumber. There are probably fifty towns in Nova Scotia as large as the one referred to and perhaps quite as actively engaged in building. This would mean an annual consumption of fifty million feet without taking into account the building that is being done in the cities of Halifax and Sydney.

While it is true that, especially in Halifax, many of the finest edifices are being built of steel, brick, stone or cement, yet, if any one will take the trouble to notice, he will see that a very large quantity of wood and timber is used while the building is being erected. One large contracting and building firm in the city of Halifax used in one year a normal quantity represented by one million feet of sawn lumber and timber.

So far, this places the consumption at not much less than 90,000,000 superficial feet.

The wood used in manufactures for domestic purposes, while very important, does not represent a large quantity. A crew of twenty men in a lumber camp will probably use fifty axe handles in one season. Then there is the quantity used for wagons, sleighs and furniture. This is chiefly all hardwood such as ash, oak, rock maple and birch.

Eleven Million Feet In Barrels and Boxes

It is rather difficult to state the quantity used for barrels and boxes for fruit and fish, except the barrels used for apples. In the season of 1911 there were about 2,000,000 apple barrels produced, although this represents considerably more than normal. A normal production at this stage of the industry should be rather more than one million barrels, but assuming it is one million, and since an apple barrel contains about eleven feet of lumber, ordinary board measure, then for apple barrels alone we must add to the general total eleven million feet, board measure.

This brings the grand total above 100,000,000 superficial feet. The next large item of consumption of native wood is for railway ties. There are at present in the province about twelve hundred miles of railway and putting the ties at an average of 2,700 to the mile, means that there are in use at any one time 3,240,000 railway ties. Putting the average life of a tie at seven years means that each year there must be supplied for the present railway needs for ties alone, the enormous number of 463,000. The ordinary standard of specification for a railway tie is six inches by eight inches and eight feet long. If this specification is adhered to, it means that each tie contains 32 feet of lumber, board measure. Then if the annual number of ties required is 460,000, this adds to the grand total over fourteen millions.

Statistical Conclusions

The figures given above go to show that the ordinary domestic consumption of timber and lumber is certainly more than 100,000,000 and possibly is fully 125,000,000 superficial feet, for, in the above, no account has been taken of small bridges all over the country.

In addition to this there is the item of wood used for fuel, and no doubt almost every person would be surprised to see by the census the quantity of firewood that is reported as being used. This, of course, is most frequently wood that is not suitable for other purposes, but it all has to go through the same process of growth.

The figures given above as the total consumption might be cut down in a few instances, but in some others they would require just as certainly to be raised, and if the total result were changed, it would no doubt be larger.

This amount of domestic consumption, if added to the quantity that is being annually exported, will give a total not far short of 500,000,000 superficial feet, and in one sense this is something to be proud of. It is pretty generally understood that a large consumption of timber is synonymous with a high grade of civilization, and while in this sense the figures may be regarded with some degree of satisfaction, it is not a good plan to use wood so lavishly and do nothing towards cultivating it.

Spruce Taking Place of Elm for Cooperage

Although elm still leads among the woods used for slack cooperage, spruce is rapidly supplanting it. In the total output of barrels in the Dominion last year, there were used, according to figures compiled by the Forestry Branch of the Department of the Interior, 80,016,000 pieces of elm, in staves, headings and hoops, as against 37,704,000 pieces of spruce. There were, however, over 11,000,000 more spruce staves and 9,000,000 fewer elm staves reported for 1911 than for 1910. In time, elm will probably be used only for hoops, as it is the best wood for the purpose, the supply is fast diminishing, and other species can be used to advantage for staves and headings. The ultimate substitute for elm will probably be birch, which is comparatively plentiful.

Slack cooperage is of vastly greater importance than tight cooperage in Canada. This is because the majority of Canadian pro-

ducts are of a rough and dry nature, such as lime, potatoes, apples, dry fish, flour, cereals, etc., and because Canadian woods are best suited for slack cooperage.

White oak, the only wood which can be used for containing of alcoholic liquids, has been practically exhausted in Canadian woodlands. In 1911 only 2,768,000 oak staves were cut, while 7,293,000 were imported.

A rough estimate on the part of the Forestry Branch places the minimum amount of material used in the manufacture of all classes of cooperage as 62,353,190 board feet, made up as follows: staves, 29,367,714 feet heading, 24,466,666 feet, and hoops, 62,353,190 feet.

Nova Scotia's Forestry Chief

J. B. Whitman, Halifax, N. S.

Mr. J. B. Whitman, Deputy Commissioner of Crown Lands for the Province of Nova Scotia, was born in Annapolis County, Nova Scotia, and at an early age commenced to work upon a farm and also in the old-fashioned sawmill located on the farm. For this reason he became familiar with the lumbering industry from his earliest days. He followed up his experience in the sawmill with lengthy periods of work in practically every situation connected with the lumbering industry. He devoted also a great deal of his time to farming and apple growing and was exceptionally successful at this work. His heart, however, was in the lumbering business, and to it, he devoted the greater part of his attention, making a particular study of the problems connected with forestry. Mr. Whitman also took up the profession of land surveying, and in connection with this work became an expert timber cruiser. The work of land surveying took him into all parts of the Province and he became familiar with Nova Scotia's forests to a greater extent than probably any other man in Canada. His work also took him to New Brunswick and to Newfoundland.

It will be seen, therefore, that Mr. Whitman is a man of wide experience, who has had exceptional opportunities for developing those peculiar instincts with which he was endowed by nature and which are most essential for one who is put in charge of such a governmental department as that of Crown Lands. Mr. Whitman's abilities do not stop, however, with those of a land surveyor, a timber cruiser, a lumberman, a farmer or an apple grower. One would imagine that this was a sufficiently wide field of activity for any ordinary man. Mr. Whitman, however, is not an ordinary man. He is one of those exceptions which are so rare and so valuable to a government. He took a fancy at one time to the profession of civil engineering, studied it, secured the necessary experience and worked for some time at the profession. Finally, however, the call of the forest was too strong, and by degrees his interests were again centred in lumbering and forestry. He took a very active part with the Lumbermen's Association of Western Nova Scotia in urging upon the government the passage of the present Fire Law.

In 1910 Mr. Whitman was appointed Chief Provincial Surveyor for the Province of Nova Scotia ,and on December 12th, 1911, was promoted to the position of Deputy Commissioner of Crown Lands, which he holds at present.

Mr. Whitman has an abiding faith in the importance of the forests of Canada as a great natural resource. Since his appointment as Deputy Commissioner, he has spared neither time nor effort in introducing new and better methods of land surveying, by requiring more uniformity of action on the part of forest rangers, by writing numerous articles for the public press and by delivering forcible addresses at public meetings; all directed to the purpose of inducing the public to realize the importance of forestry for the preservation of this great natural resource.

Until a few years ago the timber lands of Nova Scotia were sold outright by the government, to lumber operators. About the year 1900, a strong agitation was commenced to alter this method and from that date, in most cases, timber lands were leased for twenty years with a renewal clause for twenty years more. Recently, however, the value of timber lands has increased so greatly that the government decided, two years ago, not to sell or lease the lands in future, but simply to sell the timber under a license to cut. The Lumbermen's Association of Western Nova Scotia then urged upon the government the appointment of a man who had a knowledge of the timber of the Province. When the government showed a disposition to adopt this course, Mr. Whitman was recommended by the association. The law passed in 1910 provided for the appointment of a Chief Provincial Surveyor and Mr. Whitman was placed in this position. He commenced at once to devote his attention to the timber situation of the province and with legal assistance drew up the timber regulations which are now in force.

Scant Timber Resources near James Bay

The annual report of the T. & N. O. Railway Commission contains the following reference to an exploration of the country south of James Bay, Ont.:—

The explored area on the coastal plain, for quite 90 miles south of James Bay, is decidedly not a timber country. As a producer of saw logs and of pulpwood, practically the only areas are immediately adjoining creeks and rivers.

There are several reasons why it is difficult to estimate the timbergrowth in the belt of land under consideration north of the latitude of New Post:—

(1) There has been a series of fires over quite 60 per cent. of the country, and these fires have resulted in a series of second growths. The difficulty is that these second growths are of various ages, some dating back to 10, some 20, some 50, and some 75 years. Apart from this, only remnants of the original forest remain.

(2) The edges of these several burnt areas are naturally exceedingly irregular. These areas may vary from a width of 100 feet to 1,000 feet in a very short distance.

(3) The small tributary streams along which a great deal of the available timber is to be found have never been mapped and their extent is, therefore, not known.

Hence the following conclusions have been formed:—

(1) That a large number of piles (all spruce) and sufficient for all railroad and terminal purposes can be secured more or less conveniently to the work, while there is a good deal of scattered tie timber. Its scattered character makes it difficult to say whether there would be a sufficient supply to allow 2,600 ties to the mile, but certainly a large number of ties can be had.

(2) That the country can never hope to export timber products, but can expect sufficient for local uses for some time to come.

(3) That considering the manner in which timber occurs for the most part, namely, in long narrow belts, permanent sawmills can never be used. Portable mills, situated near a line of railway are the only means of handling the small cuts available. Small sawmills operated by the Revillon Co. and by the Hudson's Bay Co., at Moose Factory, have for a number of years had no difficulty in obtaining all the logs they require—about 1,000 logs per annum per mill.

(4) The large single area of pulpwood of good quality and growth was estimated at 1,000 acres. Generally the areas seen appeared to be considerably smaller than this.

(5) There is in the burnt areas sufficient fire killed wood to supply fire wood for settlers for several years.

A Splendid Opening for a Good Trade

An advertisement of unique interest to lumbermen in Canada appears on page 12 of this issue. In itself, the advertisement is unique, as it announces that the advertiser is in the market to buy, not to sell. Pianoforte soundboards are the product that the advertiser desires. It will be seen from the advertisement that Mr. Louis Bamberger, of 2 Broad Street Buildings, Liverpool St., London, E.C., England, is in the market with a large and regular demand for pianoforte soundboards. These articles were formerly manufactured in Europe, but the enterprise of United States manufacturers resulted in their securing the business. Mr. Bamberger believes that Canadian manufacturers could secure this business and he is now on the lookout for some enterprising Canadian who would like to go into it.

There seems to be no reason why Mr. Bamberger's conviction that Canadians could produce good soundboards which would command the English trade, should not be proved correct. It is apparently only a matter of going after the business.

At the present time, if we are correctly informed, there is not a factory in Canada manufacturing pianoforte soundboards. Piano manufacturers in this country obtain their soundboards from the United States, paying 25 per cent. duty on the finished article. The United States also supply the majority used in England.

Soundboards are made from selected spruce, the greater part of which is cut in the Provinces of Quebec, Nova Scotia and New

Brunswick, and enters the United States in the shape of logs, duty free. An average soundboard is about five feet 6 inches long, 4 feet 2 inches wide, has a thickness of three-eighths of an inch, and is made up of lengths of spruce glued together and sandpapered.

It has been estimated that between 25,000 and 30,000 soundboards will be imported into Canada this year, and the English demand will probably be in the neighborhood of 125,000. Taking $3 as the average price of a soundboard, the value of English and Canadian markets combined will approximate $500,000.

Although there may be considerable waste from the spruce in short wood, there are a number of uses to which this short wood can be put. The United States manufacturers use a large quantity of it for making butter boards, egg boxes, etc., and there seems to be no reason why a box-making plant could not be run in connection with a soundboard factory.

There can be no question that Canadian piano manufacturers would prefer to purchase soundboards in their own country, and it is an admitted fact that English buyers, prices and terms being equal, are anxious to deal within the Empire. The advertisement referred to shows that one large English firm is already looking to Canada for its regular supply.

When one considers the possibilities in this business; the fact that the material is right at hand; the necessary plant being by no means expensive, the process simple, and a large and steady trade assured, it looks as though Canadian manufacturers could establish a steady and profitable business in this line.

Parrsboro, N.S.—Busy Shipping Centre

Average Annual Shipments of 35,000,000 Feet—Business with Great Britain Seriously Hampered by High Freights—Interesting Trade Details

One of the most picturesque and at the same time one of the busiest towns on the Basin of Minas, Nova Scotia, is Parrsboro, whence extensive shipments of lumber are made by vessel to the various foreign markets of Great Britain, United States, West Indies and South America. The appearance of the country is scarcely such as to give one the idea that extensive lumbering is in progress round about, but if one were to make enquiries he would find that the shipments of deals from Parrsboro roads have been at an average rate of about 35,000,000 feet per year. During the present year a great falling off in the shipments to Great Britain has occurred on account of the extensive advances which have taken place in the freight rates upon transatlantic vessels. It is expected that the shipments from Parrsboro roads for the present year will only amount to from 15,000,000 to 18,000,000 feet. Shipments of deals from the the various ports on Minas Basin amount in an average year to between 60,000,000 and 70,000,000 feet, to Great Britain and the United States. The average shipments from the Minas Basin to the United States amount to from 30,000,000 to 40,000,000 feet annually. Although the shipments from Minas Basin to Great Britain have fallen off considerably during the present year they are not expected to have increased so far as the United States are concerned, as the cut last year was rather light. In the Minas Basin district there are a number of important shipping ports in addition to Parrsboro, some of them being Hantsport, Windsor, Walton and Five Islands. Practically all the shipments from Minas Basin for Great Britain however, come to Parrsboro Roads where they are transferred by lighters to the large transatlantic vessels.

Parrsboro's Annual Shipments

A comparative idea of the shipments from Parrsboro may be obtained from the following figures for which we are indebted to Mr. Woodworth, the well known harbor master of Parrsboro.

During 1911, shipments of deals, battens, scantling and ends to England amounted to 29,662,217 superficial feet valued at $408,215. The exports of spruce and hemlock boards and scantling to the United States during 1911 totalled 3,829,514 superficial feet, valued at $48,626. 1911 was a very bad year so far as exports were concerned, the foreign markets all being very weak. The shipments during the year previous were nearly double those of 1911 and it is expected that this year's shipments will more than double those of last year.

During 1911 exports of laths to the United States amounted to 12,613,600 pieces valued at $29,322. This total was about 2,000,000 pieces greater than the total of the year 1910.

During 1911, exports of piling amounted to 62,165 pieces valued at $88,944, a considerable increase over the year 1910.

Exports of deals, battens, scantling and ends to Great Britain during 1910 amounted to 24,663,365 superficial feet, valued at $340,-344.

Shipments of spruce and hemlock boards and scantling to the United States during 1910 amounted to 6,360,201 pieces valued at $86,097.

Shipments of laths during 1910 amounted to 10,600,100 pieces valued at $23,952.

Shipments of piling during 1910 amounted to 54,948 pieces valued at $80,835.

During the year 1909, the shipments of deals, battens, etc., to Great Britain amounted to 33,796,746 ft. valued at $456,436.

During 1909 the shipments of piling amounted to 62,715 pieces valued at $96,448.

The total output for the year 1909 was 43,894,807 feet of sawn lumber. During 1910 the output was 33,083,786 feet and during 1908 the total was 32,565,956 feet. These totals do not include the piling which amounts annually to about 40,000 pieces.

Some twenty-two years ago the total shipments from Parrsboro amounted to 44,000,000 feet and all the wiseacres stated that this was just about the end of the lumbering industry in this district. They thought that the lumber was then practically all cut out. In spite of these predictions however, the shipments have varied from 32,000,000 to 43,000,000 feet every year since that time. The pessimists of those days failed to reckon with the reproductive powers of the Nova Scotia forests. An instance of this remarkable power of reproducing is afforded by the case of a timber property not far from Parrsboro which was all chopped over eighteen or twenty years ago. The owners of the property ceased operating upon

J. N. Pugsley's Mill Eatonville, N. S.

Newville Lumber Company's Mill, Newville, N. S.

it and allowed it to rest. Since that time it has fortunately escaped any damage by fire and to-day it is all ready for chopping once more and is held at a price which will effectually prevent anything in the form of speculation.

The shipments referred to in the above statistics are all made from Parrsboro but they come from various ports of Cumberland and Colchester counties. Some of them come from Moose River, eight or nine miles away. The others are from Five Islands some fifteen miles to the east. Quite a number come from Bass River in Colchester county and a few have also been coming of late from ports in Hants county across the Basin of Minas. In the other direction shipments also come to Parrsboro from Port Greville, Advocate Harbor and Eatonville.

The shipments from Parrsboro by vessel do not give a complete return of the output of the district, as large quantities of lumber are also shipped from Cumberland by rail to Pugwash and Halifax.

One of the most picturesque features of the lumber trade in the early days was the number of large square-rigged vessels which came to anchor in Parrsboro Roads to take on cargoes for foreign markets. Twenty-two years ago, as many as twenty-one square rigged vessels were seen in Parrsboro Roads at one time. The shipments to-day are carried to England in steamers, each of which take away many times the quantity that used to be shipped by the sailing vessels. Sailing vessels are still employed in the trade with the United States but these are not the stately square-rigged vessels of the early days. The shipments to the United States are practically all made in two or three mastered schooners.

An off-shoot of the lumber industry at Parrsboro has lately developed in the form of a mill for the production of apple barrels. Dr. Edward Jeffers of the Jeffers Milling Co. has started an apple barrel mill which has now been running for about three months. The indications are that this industry will be quite a success. If this is the case, the firm will export barrel shooks to the Annapolis Valley. The firm expect to get out about 10,000 barrels this year. Practically all of this output will be consumed at Parrsboro for the shipment of potatoes to the West Indies and Cuba. The trade in potatoes with the West Indies, Cuba and South America is steadily growing and the shipments are all made in barrels.

The ship building industry in the neighborhood of Parrsboro was at one time quite extensive. As many as 12 vessels have been building at one time, most of them being schooners and barges of from 100 to 700 tons. The decline in freight rates however, consequent upon the extension of the steamship industry quickly caused a decline in the ship-building industry at this point.

Piling—An Important Side Line

One of the most interesting branches of the lumbering ludustry in this part of Nova Scotia is the taking out of trees which are to be used for piling purposes. Mr. J. Newton Pugsley of Parrsboro has been one of the most extensive operators in this line for some years. He has taken out during the present year about 20,000 spruce trees for this purpose, all of which are sold in the United States at about $1.50 a tree. These are used for piling in foundations of large buildings, wharves, etc. For this purpose, only trees which are growing fairly close to the sea shore are suitable. As the trees are taken out whole they could not be floated down any of the rivers. The operation therefore consists of cutting the trees, drawing them to the shore, surveying, sorting and doing a little finishing. It costs just about as much to do this work as to saw the trees into lumber. The trees are brought out of the woods on sleds in much the same manner as logs. The piles will net an operator about $17 per M. superficial feet, whereas sawn lumber works out at about $13.50 at the mill. Last year there was shipped out from the north shore of the Bay of Fundy and from Cumberland Bay about 95,000 trees to be used for piling. In some years the shipments have been as heavy as 175,000 trees.

In their finished form, ready for the market these trees are 10½ in. at the butt for the smallest ones and they vary up to 16 in. and sometimes as high as 18 in. A tree 10 in. at the butt will sometimes be used if it is about 37 ft. long. A 10½ in. tree at the butt will be 6 in. at the top. One of the most favored sizes is 12½ in. at the butt. This class must be 35 ft. in length at least and it runs up to 44 ft. All trees in this class are known as No. 1 and will bring about 7c. per lineal ft. in New York and Boston. The next class in 12½ in. (No. 2) runs from 44 ft. to 48 ft. in length including the 45, 46 and 47 ft. lengths. These will bring from 7½ to 8c. per lineal ft. The next class (No. 3) 12½ in. runs from 48 ft. to 55 ft. and sells at from 8½ to 8¾c. in New York and Boston, the 4th class running from 55 ft. up will bring from 9 to 9½c. per lineal ft. The 14 in. butts are classed as 40 ft. and up in length and usually sell at about 9c. per lineal ft.

The market for piling has been rather weak ever since 1907, previous to that year the sales were much more frequent and the surveys were more favorable to the seller. Since the decline in the market the surveys have been very unfavorable to the seller. The great majority of piling is spruce though some buyers will take from 5 to 10 per cent. of fir when the market is in good condition. It is expected that during the present year shipments will fall to about 35,000 to 40,000 trees, but it is also believed that the present dull trade is only a temporary condition on account of the small quantity of work in progress on harbor improvements, etc., upon which a great deal of the piling is used. With the present increase in building operations both in United States and Canada the market for piling should pick up in the very near future. An idea of the quantity of trees which will be consumed for piling in the construction of a large building may be obtained from the fact that on one job in Boston a few years ago, no less than 75,000 trees were used. This was in connection with the extension of the yards of some of the large railway companies.

Quite a number of spars and piece sticks are also shipped annually from Parrsboro. The piece sticks are scaled according to the following system:

The first size, 40 ft. long is 10 in. in diameter 1/3 of the way from the butt and 5 in. at the top. These are used for small booms, top masts, etc. The quantity of these demanded by the trade is comparatively small.

The second class, 44 ft. long is 11 in. in diameter 1/3 of the way from the butt and 6 in. at the top.

The third class is 48 ft. long, is 12 in. 1/3 of the way from the butt and 7 in. at the top.

The same ratio is continued as the piece increases in size, 1 in. being added to the diameter for every 4 ft. in the length. Piece sticks are secured as long as 70 ft.

Shipments of spars are comparatively rare. They run from 3 in. to 10 in. at the butt, most of them are shipped to Baltimore and a few go to Bridgeport, Connecticut.

One of the reasons for the present quietness in the market for piling is the fact that Southern pine stock has been used extensively in New York for the same purpose.

Camp on Jones Brook—Newville Lumber Co.

Spruce Saw Logs—Newville Lumber Co.

Piles of the average length of 44 ft. and 12½ in. at the butt bring about 75c. to 80c. per tree on board the vessel, or about 4½c. a foot.

Parrsboro's Leading Lumbermen

Among the lumber men who have been prominently identified with the town of Parrsboro for a number of years Mr. J. Newton Pugsley occupies an important position. His business is both as a manufacturer and a wholesaler. He conducts mills at Avon River in Hants County and at Eatonville in Cumberland County. Mr. Pugsley's shipments include some 16,000,000 to 18,000,000 ft. annually to English markets and from 7,000,000 to 8,000,000 ft. to markets in the United States. Mr. Pugsley's two mills are rotaries each having a capacity of about 30,000 ft. per day. His limits on the Avon River amount to about 22,000 acres and those on the Eatonville River total about 18,000 acres, taking in Cape Chignecto. During the present year Mr. Pugsley expects to ship to English markets only about 10,000,000 ft. on account of the excessive freight rates charged by transatlantic vessels. Freights during the present summer from Parrsboro reached as high as 55s. per standard to the English markets, whereas last year they varied from 32s. 6d. to 35s. Reference to Mr. Pugsley's shipments of piling has already been made in a previous paragraph of this article.

Mr. J. W. Kirkpatrick is another prominent Parrsboro lumberman, operating a mill at Lakeland near Parrsboro which has a capacity of 20,000 ft. per day, turning out about 2,000,000 ft. per annum. This product is largely spruce and is sold both in the United States and Great Britain. Most of the spruce during the present year has been going to the United States on account of the heavy freight rates to Great Britain. The mill also cuts a considerable quantity of hardwood most of which is sold in England and a portion of it in the Maritime Provinces. One of Mr. Kirkpatrick's customers in the Maritime Provinces is the firm of Rhodes Curry & Co., Amherst, N.S., who purchase a large quantity of 1½ in., 2 in., 2½ in. and 3 in. clear birch for flooring and general finishing purposes. The Canada Car Company, another of Mr. Kirkpatrick's customers, buys about 300,000 ft. of birch car framing in 4 in. x 4¼ in., 4¾ in. x 5 in., 5½ in. x 5¾ in. and 8 and 9 ft. lengths. The same firm also purchase such stocks as 2¼ in. x 10 in., 2¼ in. x 11 in., 4 in. x 11 in., and 1¾ in. live sawn birch. The Lakeland mill is equipped with a rotary, edger, slab saw and trimmer.

Mr. Kirkpatrick also operates a mill at Five Islands, Colchester County, about 15 miles east of Parrsboro, located on the Bass River. This mill cuts about 25,000,000 ft. per year, the daily capacity being from 25,000 to 30,000 ft. The product is all spruce and birch, the greater part being spruce. The output is all sold in the English and United States markets. The equipment is similar to that in the Lakeland mill with the addition of a lath machine and planer.

During the present year Mr. Kirkpatrick expects to ship about 4,500,000 ft. During an ordinary season about three-quarters of his output is sold in England.

Mr. Kirkpatrick recently purchased the Eatonville mill formerly belonging to Mr. J. Newton Pugsley, of Parrsboro. The price was in the neighborhood of $100,000. The purchase also includes about 25,000 acres of spruce and birch, the greater part being spruce. The entire property is covered with a good growth of timber.

The Moose River Lumber Company of Parrsboro operates a mill some 7 miles east of the town. The members of the company are B. L. Tucker and Hugh Tucker, the former occupying the position of manager. Their mill cuts about 3,000,000 ft. per year and about 30,000 ft. per day. It is equipped with one rotary saw, edger, trimmer and lath machine, the latter having a cut of 22,000 to 23,000 lath per day. During the present season the Moose River Lumber Company will only cut about 1,000,000 ft.

Burpee L. Tucker of Parrsboro will ship about 5,000,000 ft. to England during the present year and 5,000,000 ft. to the United States. Last year his shipments on his own account amounted to about 2,000,000 ft. from Halifax and 11,000,000 from Parrsboro to the English market and about 5,000,000 ft. to the United States. Most of the lumber which Mr. Burpee L. Tucker handles is spruce although he also ships a small quantity of hardwood. Last year his hardwood shipments amounted to 3,000,000 ft. He also handles a small quantity of hemlock. Mr. Tucker operates a portable rotary mill at Stillwater with a capacity of about 1,500,000 ft. per year, cutting spruce, hemlock and hardwoods.

The Newville Lumber Company of Parrsboro the members of which are Capt. J. Spicer and P. L. Spicer, operates a mill at Newville, about 10 miles north of Parrsboro, which is equipped with a single rotary saw, edger, trimmers, planer and lath machines. Its average cut in one year is 3,000,000 ft., the daily cut being about 30,000 ft. in addition to 25,000 lath. This company's limits are located about 6 miles from the mill on the Halfway River. They dispose of about two-thirds of their cut in the English markets and the balance goes to the United States. Last winter the Newville Lumber Company bought a new property consisting of about 6,000 acres, together with a rotary mill. The lands belonged to the late H. W. McKenna. This property has not yet been operated by its new owners. The company are very fortunately situated in connection with securing their logs as they have only to be driven about 6 miles on the Halfway River until they reach the Halfway River Lake which is used by the company for a log pond. This lake is about ½ mile wide by 1 mile long.

The Newville Lumber Company pay particular attention to getting both a good quality of lumber and as much as possible from their equipment. They consider, in fact, that they have a record cut for an ordinary friction gear carriage. During a single day a few years ago they turned out 64,000 ft. of lumber. The company operates 2 camps during the winter, employing 50 men in all. They employ about 30 men around the mill and also have a farm in the neighborhood of the mill from which they secure much of their requirements for the camps. The farm is about 125 acres in extent and has an excellent crop of hay, oats, and roots.

Newville Mill Destroyed by Fire

Since the above article was written we have learned with much regret that the mill of the Newville Lumber Company at Newville, Nova Scotia, a picture of which appears among the illustrations of this article, has been destroyed by fire. The fire occurred on August 23rd at about 9 o'clock at night, and the mill was totally destroyed with all its contents. About 150,000 feet of lumber and 1,000,000 lath were burned in the yard. The flames also destroyed a carload of lumber, the company's railway siding, a blacksmith's shop containing two wagons, and a lot of tools. The loss is estimated at $20,000, partly covered by insurance. In the mill-pond, the company have 1,000,000 feet of logs, which will be sawed by portable mills. It is understood that the mill will not be replaced during the present year.

Ontario Leases the Abitibi Limit

Messrs. Shirley Ogilvie and F. H. Anson, of Montreal, the Successful Tenders — A Bonus of $105,000

Messrs. Shirley Ogilvie and F. H. Anson, of Montreal, are the successful tenderers for the Abitibi pulp limit offered by the Ontario Government. The amount of the bonus to be paid to the government is $5,000 per year, distributed over a period of twenty-one years, making $105,000. This represents the right to cut pulpwood and timber on the limit and entitles the successful tenderer to obtain a lease, upon the usual terms, of Iroquois and Couchiching Falls for power purpurposes. By the terms of the lease, ten per cent. of the bonus must accompany the tender.

Spruce pulp wood cut on the limit will be subject to the usual tax of forty cents a cord. For timber cut $1 per 1,000 feet board measure will be due the Department. No sum is stipulated for the rental of the power at Iroquois and Couchiching Falls, as this part of the contract will have to be adjusted by the Hydro-electric Power Commission under the legislation of last session.

An additional undertaking, not required by the government, which Messrs. Ogilvie and Anson have inserted in their offer, is that during and after 1913 they will advance for the purpose of being expended or shall expend $50,000 in preparing buildings and land for settlers in the neighborhood of Iroquois Falls. None of the land on the limit goes with the lease, so the conditions under which this money is to be expended will be decided by the Minister or Lands, Forests and Mines, although a lien will be retained on all property sold until the purchasers repay the amount on each farm in easy installments.

The tenderers also agree to buy wood and agricultural products from the settlers and to promote as far as in their power the development and settlement of the district.

A joint stock company with a capital of $1,500,000 is to be organized to carry out the enterprise.

An integral part of the scheme is the construction of a pulp mill costing, with equipment and machinery, not less than $500,000, with a daily output of one hundred tons of pulp and the employment of 259 miles on an average for ten months in the year. This investment is distributed as follows: $100,000 during the first year; $200,000 during the second year; and the balance during the third year. Cutting may commence on the limit so soon as $100,000 is expended on the mill.

The successful tenderer is also under agreement to erect a paper mill on the order of the Lieutenant-Governor in Council, which shall have a capacity of one hundred tons of paper per day and shall turn out not less than seventy-five tons of paper per day.

Spruce, balsam, jack pine, poplar, white wood trees, etc., can be cut by the successful tenderers.

The same parties previously tendered for the Abitibi limit when it was offered on a former occasion. At that time, however, the terms offered did not satisfy the government, the amount offered not being considered sufficient and no agreement was made.

Forestry Methods in Province of Quebec

Careful Oversight of Lumbering Operations By Officers of Forest Service—Timber Owners Cooperating With Government—The Work of the Forestry School

G. C. Piche, Quebec, P.Q.

THE Forest Branch of the Department of Lands & Forests of the Province of Quebec has of late years made great progress in the work of surveying the forest lands of the province and in protecting its timber resources. With so large a country to cover and such extensive timber resources, the work of the Department is necessarily of the most difficult nature and requires the expenditure of a large amount of money, together with the efforts of the most efficient staff that can be brought together. The policy of the department of Lands and Forests has been to employ in the work of the Forest Branch, only men who have shown themselves thoroughly versed in matters of forestry. In the first place they inaugurated this policy by securing as the head of the Branch, Mr. G. C. Piche, a man who has made forestry his life work and who has that fortunate combination of business ability and tact which are essential in one who is to take charge of the forestry work of such a large province as Quebec. Mr. Piche's work is often of a nature requiring the utmost tact and knowledge of human nature, as it constitutes him a go-between whenever the interests of the Department and those of the lumbermen, or the interests of the lumbermen and the settlers, appear to be at variance. That he has been successful in gaining the co-operation both of the settlers and the lumbermen is attested in many quarters and speaks volumes for his fitness for the position which he occupies. One hears occasional criticism of the department in connection with individual details of its work, yet on the whole Mr. Piche has been able to secure the co-operation of the lumbermen and has brought them to feel that the interests of the province and their own interests are in many cases identical. The natural result has been that the regulations which he is called upon to enforce and the recommendations which it is his duty to make to the lumbermen as to the management of their operations are received with goodwill on practically all sides, and that the province and the lumbermen are already finding that their mutual interests are being rapidly advanced by Mr. Piche's work.

The Forest School at Laval

Following out the same policy which led to the appointment of Mr. Piche as head of the Forest Branch, the Government of Quebec, on Mr. Piche's recommendation, has established a Forestry School in connection with Laval University, the students of which, both as undergraduates and graduates, are employed in the forest service. In this manner there is being built up a service which has already shown splendid results and which, in the years to come, cannot fail to play a most important part in the preservation and development of the timber resources of the province. The Forest School has this year commenced to see the fruition of its work, as the first graduation of students took place on June 18th, when seven students obtained their diplomas. These men are now being employed by the government in field work. The forest branch is using them in connection with ten parties which are being sent out on the work of exploring and classifying the land and timber in various parts of the province, extending all the way from Abitibi to Gaspe.

Front of Sand Dune Creeping over the Land

A large percentage of work done by the Forest Branch consists of preventing bogus settlers from deunding the timber lands of the province. An indication of the extent of this work is afforded by the fact that, during the past four years $200,000 has been collected from bogus settlers in the form of fines. This is as large a sum as had been collected in the fifteen years preceding.

An important work of the Forest branch is in connection of superintending the lumbering operations throughout the province. They pay particular attention to prevention of waste and the lumbermen in the majority of cases are working in harmony with the government. The Forest Service requires lumbermen to furnish lists of their operations, each year, before the first of December. The statement also shows the name of the foreman of the camp and the name of the scalers, together with the quantity of timber which it is intended to cut and the location of the cutting. The government uses this statement in deciding upon the location of its forest rangers. Each forest ranger has to make one visit to the camp and report upon the progress of the cutting each time that he visits the camp. The forest ranger is expected to visit each camp once a month. It has been found that one man can visit from fifteen to thirty camps during a month, according to their location. Upon receiving these reports from its rangers the Forest Service writes to the lumber operators, either congratulating them upon their work, or asking them to make

Plantation made at Oka, Que., in 1887

Forest and Soil Destroyed by Fire

alterations which are considered necessary. These letters and recommendations have been received by the lumbermen in the spirit in which they are sent, and have been the cause of a number of important improvements being made in lumbering operations.

Each foreman in the lumber shanty is required by the Forest Service to keep a shanty book, in which he records daily, the number of logs cut and other information regarding the different operations. This book is also checked up by the forest ranger. The government scaler makes his report in the same book, this report is also checked up by the forest ranger. At the end of the season the foreman makes

A Quebec Lumber Camp

his declaration in the book as to the amount of timber cut and the scaler makes a similar declaration. A margin of five per cent. is allowed for variations in the estimate of the two different parties. If the variation is greater than five per cent. the Forest Service looks into the matter more closely.

The work of the forest rangers is checked by forest agents. Each forest agent is in charge of from three to ten rangers, and is supposed to visit each of them and to see that their work and other reports are properly attended to. In addition to the above, the department employ a staff of expert scalers whose work takes them from one end of the province to the other. Last year the Service had in its employ ten inspectors, nine expert scalers, fifteen forest agents, fifteen students, and fifty-four forest rangers.

An important part of the Forest Service is now connected with the township forest reserves, which were recently established. There are seven of these, aggregating 120,000 acres. The object of these reserves is to furnish timber to the farmers upon payment of stumpage dues.

Checking up the Lumbermen's Reports

Lumbermen are required to furnish their detailed reports of their operations to the Forest Service before the 30th of June each year. These reports cover all their operations on timber limits and upon

Forest Students Leaving for Camp

all other lands. The reports are sent in to the timber agent, whose duty it is to prepare the account for stumpage, etc. The agent's account is then submitted to the Forest Service for revision. It is in this manner checked up according to the reports of the Forest Service. The Service has thus been able to put a stop to the stories that used to prevail, regarding alleged arrangements between timber owners and the agents of the Forest Branch. The Forest Service now believes that the amount which it looses through incorrect reports is practically negligible. In some sections of the country the government gets more stumpage even than it is entitled to. In such cases it makes a point of advising the lumbermen to that effect.

The students of the Forest School are employed by lumbermen during their holidays as scalers and also for doing general work in the woods. In addition to the work as outlined above the Forest Service carries on an educational campaign among the farmers and lumbermen. Lectures are delivered frequently to farmers and others.

The work of reforestation is also attended to by the Forest Service and the students of the Forest School. A nursery is conducted at Berthierville, where 1,000,000 young trees are raised annually. Berthierville is a place of considerable historic interest to the lumber industry of Quebec. In 1712, about 500 cubic feet of red oak was cut there and rafted to Quebec, to build the first wooden ship constructed in Canada.

Mr. Piche and His Work

Mr. G. C. Piche, the chief of the Forest Service of Quebec Province, was born on December 2nd, 1880, in Montreal, where he was educated in the primary school and at St. Louis College, from which he graduated in 1897. It was then his intention to take up the profession of civil engineering. Lack of funds, however, obliged him to go into business at once. His first position was secured with the C. P. R. in the passenger department, where he remained until the end of 1900. In the latter year he secured a position with the Belgo-Canadian Pulp Company at Shawinigan Falls, Quebec. Mr. Piche was connected with this company until 1903, and during this period he had a very wide experience, including all kinds of work in the woods and at the mill. In 1903 he left the Belgo-Canadian Company to enter the Ecole Polytechnique and take up the study of civil engineering. During his course at the Polytechnique School Mr. Piche took great interest in studying the forestry methods in use in France and this led him to urge upon Sir Lomer Gouin, Premier of Quebec, the wisdom of adopting similar steps in connection with the forests of the Province of Quebec. Sir Lomer Gouin consulted Monsignor Laflamme, who was then known as the Apostle of forestry in Canada and who occupied the chair of Natural Sciences at Laval University. Monsignor Laflamme approved of the suggestion and Mr. Piche, together with Mr. Avila Bedard, were sent to Yale Forestry School in 1905, graduating in 1907. Since his graduation Mr. Piche has been continuously associated with the Department of Lands and Forests of the Province of Quebec. In 1908, upon the death of Mr. Langelier, who had been Superintendent of Forest Rangers for the Province, Mr. Piche was put in charge of the whole Forest Service.

In 1909 Mr. Piche and Mr. Bedard were authorized by the government to take in a number of student assistants. This step was adopted as a preparation for the establishment of a Forestry School at Quebec. In the year 1910, when the school was founded, ten students were available who had in this manner gone through their preparatory work and in the present year the Forestry School graduated its first class. The school is affiliated with Laval University and the government gives it an annual subsidy of $5,000. Candidates who wish to enter the school must be twenty years of age, must be able to speak French and English correctly and must pass the entrance examination. This examination takes the form of a contest, as there are ten scholarships to be granted. There is no restriction put on the number who can attend and pay fees at the school. During the three years' course the fees amount to $200. The course at the forestry school lays particular stress upon mathematics, the aim being to equip graduates as far as possible for engineering work. There is also a course in construction of sawmills, pulp mills, etc. A number of other courses are included, one, for instance, being a course in medicine, particular attention being paid to first care in cases of accident.

It will be readily realized from the above outline of the work of the Forest Branch, that Mr. Piche's hands are pretty full and that he has a great field in which to show his worth. The work of the Branch has been largely of an organizing nature in the past, but definite benefits have resulted from the first. Other provinces are watching the work closely and its success is likely to result in similar work in the other provinces. There is no question about the urgency of the demand for work of this nature and it is greatly to be hoped that Quebec's example will prove contagious.

Fred. Dayton, of Edmunston, ...B., recently visited Fredericton to make inquiries as to the amount of logs owned by the St. John Lumber Co., of Van Buren, Maine, which came down to the booms here this season. Already about two million feet of this lumber have been rafted, and it is expected that the season's total will be about three million feet. This lumber was in the ice in the main river during last winter and came down with ice in the spring before the booms at Van Buren were in position. The spruce among the American lumber will be sawed at Warner's mills at St. John, while the cedar will be manufactured by John A. Morrison at the Phoenix mills, this city.

The Pulp and Pulpwood Trade of Quebec

Factors Which Have Brought About the Recent Important Developments in This Great Industry — Quebec's Strong Position in The World's Trade

(Specially Written for the Canada Lumberman)

All indications point to an increasing request for pulpwood, ground wood and chemical pulp, with advancing prices. From various causes, principally that of a small labor supply, there is not sufficient wood to meet the demand, and as the consumption of paper naturally tends to expand, quotations are more likely to rise than to fall. Domestic requirements will certainly improve, as Canadians are putting more and more capital into paper mills, with the result that there will be a dimunition in the amount available for export. News print paper is in splendid demand, and prices are firm. Manufacturers and purchasers foresee their requirements sometime in advance, and although large sales are frequently reported, they have been expected and therefore have very little effect on price conditions when they occur. A well-known authority, speaking on the subject to a representative of the Canada Lumberman, declared that Canadians are able to dispose of their news print as fast as they can produce it, and at good prices.

Reduced Shipments and Their Meaning

The average monthly shipment of ground wood pulp from Canada to the United States during 1911 amounted to 22,000 tons. The shipments for the month of February, 1912, amounted to only 6,000 tons, those for March were 9,000, those for April were 11,000, and those for May 16,000. This is accounted for by the fact that pulp mills in the United States have had a very plentiful supply of water during the present year. Last year they were very short of water power, and their stocks of logs accumlated enormously, so that this year they have had both heavy stocks of logs and lots of power for turning them into pulp. The result is, that they have not needed to buy so much wood pulp from the Canadian mills. Canadian mills, however, have been exceptionally busy turning out pulp, and there is a splendid demand for practically everything they can produce. There has been a very scarce supply of ground wood pulp in Europe during the past winter. They now have plenty of water in Europe and have been experimenting similar conditions to those of the United States. Probably the largest dealer in pulp in the world recently purchased 500,000 tons of ground wood at present mill prices, to be delivered during the next ten years, at the rate of 50,000 tons a year. This dealer certainly is clearly a believer in prices holding up, as he would not make such an extensive contract covering so many years to come if he were not confident that prices are lower than they will be at any time during the next ten years.

Strong Markets for Ground Wood

Ground wood to-day is selling at $18 at the mill at the very lowest. No one will accept less than this. The stocks from Norway are not cutting any figure in the United States at present, as they are able in Norway and upon the European continent to take up practically everything that is produced in that country. Newfoundland is selling ground wood at about $16.00 to $17.00, and the manufacturers moreover, are able to reach New York on a somewhat lower freight rate on account of the all-water haul.

The demand for chemical pulp is better than it has been at any time for the past six years, and prices are up anywhere from $3 to $5 per ton, as compared with eight months ago. The advance seems to be the result of world wide conditions in connection with the industry.

There is a difference of opinion among paper and pulp manufacturers as to the effect of the policy of the Gouin Government in prohibiting the export of pulp wood from Crown lands. Probably the difference is to some extent explained by the way the policy affects people; but there would appear to be a majority in favor of the continuance of the policy, on the ground that it tends to compel the manufacture of pulp on this side of the border. It is objected that the act is very easily evaded, and that Crown lands can be quickly converted into private lands by the simple expedient of settlers receiving grants, and selling the wood to various manufacturers. This is no doubt done to some extent, but probably not to the degree that some who oppose the prohibition state. It is certain that there will be wood from private lands for sale for many years to come, and we are informed of one firm which has been offered 150,000 cords per year of privately owned pulp wood for a period of 20 years. The price of pulp wood cut from privately owned lands has advanced about $1.50 a cord during the past six months. It is about $8 to $8.50 for peeled wood on the cars at the point of shipment.

Naturally, the political situation in the United States, is of great interest to those identified with the paper and pulp industries, as the result of the election may affect the tariff on those articles. It may be pointed out however, that no material changes could be made in the tariff for a year, because the elections will take place in November. Congress will meet in March, and would not adjourn until the middle of the summer. No contentious bill could be carried until the middle of next summer, and it is quite possible that any bill for removing tariffs would be delayed until the end of the session, and perhaps carried over into the next session. It is generally thought that the Democrats would like to put into effect a world wide tariff giving free entry for pulp and paper in the United States. If this were done Canada would then simply be on an equal footing with all other countries, and our paper or pulp, whether taken from Crown lands or private lands, would have to compete with that from other countries. We would probably be able to meet this competition successfully and to do a large business under such conditions.

An Important Manufacturing Experiment

An interesting experiment is about to be tried at New York in the way of the manufacturing of paper at a tide-water mill. The idea is that sulphite pulp and mechanical pulp can be imported to this mill, and there manufactured into paper. A large saving is expected, because there would be no rail freight rates upon the raw material or manufactured paper, or outlay for forest lands or for the extensive machinery necessary for the manufacture of pulp. Sulphite pulp would be brought from such countries as Norway, and chemical from Canada, and the two combined at Brooklyn, where this experimental mill has been erected. If it is successful, other mills are proposed at Cleveland and Chicago.

A Half Century in the Timber Trade

Mr. Edward Harper Wade, Quebec

Edward Harper Wade, Quebec

One of the most genial, widely known and at the same time successful lumber exporters in the city of Quebec is Mr. Edward Harper Wade, manager of the Harper Wade Export Co. The accompanying portrait will be recognized by his friends as an excellent likeness of Mr. Wade. The Harper Wade Export Co. was formed and commenced its business career in 1910, devoting its attention to the shipment of wood goods. Mr. Wade had previously occupied the position of manager for the McArthur Export Co. Ltd. from the date of its foundation, and previous to that, had been manager of the export business of the McArthur Bros. Co. Ltd. for a number of years. These companies completed their business careers and Mr. Wade then inaugurated the business of the present Harper Wade Export Co.

Mr. Wade was born in Liverpool in 1846, being a descendant, on both sides, of Liverpool business people. Samuel Mosley Wade, his father, and Samuel Wade, his grandfather, were for long years engaged as brokers in the cotton trade of Lancashire. His mother was a daughter of Richard Harper of Law Hill, Liverpool.

Mr. Wade's connection with the Canadian timber trade dates from the year 1862 when he entered the Liverpool office of Messrs. Sharples, Jones & Co., who then carried on a large wholesale importing business in Quebec timber, in connection with their Canadian house. Mr. Wade's father had been lost at sea and the son was apprenticed by his guardian to the firm of Sharples, Jones & Co. in the good old-fashioned style, binding the apprentice to five years' service, in consideration of being taught the trade of a timber merchant. This

engagement was faithfully carried out on both sides and every opportunity was given for the acquisition of such knowledge of all the timber mysteries as the Canada Dock Quay or the town office of the firm afforded. The lessons of straight-forward and truthful dealing and literal fulfilment of all business obligations and promises were duly incalculated and those who know Mr. Edward Harper Wade, however slightly, know better than anything else, how firmly he has clung to these principles of business life throughout all the intervening years.

When his term of apprenticeship had expired, Mr. Wade remained with the firm for three years, after which he was transferred to the Quebec office of C. & J. Sharples & Co. Shortly after this, the Quebec firm became known as John Sharples, Sons & Co., and the Liverpool house was styled, Henry Sharples, Sons & Co. All the senior partners of this firm had passed away before Mr. Wade left its employ in the year 1877. For several years previous to this date, Mr. Wade has travelled on contract business for the firm in all parts of the United Kingdom, particularly in Ireland and North Wales, districts at that time importing large quantities of Quebec goods. Such responsible work scarcely ever fell into the hands of so young a man at that time, but the high standard and careful shipments of the firm served Mr. Wade well, and enabled him to advance and extend the connection of his house into the districts which were especially left to his care.

At the end of the year 1877, Mr. Wade entered into business arrangements with the old and well-known Quebec firm of Roberts, Smith & Co., continuing with them as a salesman for three years and enjoying a percentage of the profits of the business. When Mr. Joseph Roberts retired in 1880, Mr. Wade was admitted into partnership by Mr. R. H. Smith, and the firm name became Smith, Wade & Co. Mr. R. H. Smith retired at the end of 1886 and Mr. Wade continued the business under the old name, until he took charge of the McArthur export business, as mentioned above. In the month of May of the present year, Mr. Wade completed a half century in the timber trade.

Pulpwood Situation in Quebec Province

A Minute Consideration of the Statistics from the Point of View of Those Who Disapprove of the Prohibition of Export

Contributed specially to the Canada Lumberman

The statement so frequently made by the public press of Quebec Province, that the law enacted in 1910, prohibiting the exports of pulpwood cut on Crown Lands after May 1st, 1910, has already proved of great benefit, by materially reducing these wood exports, and by compelling United States pulp and paper mills to come to Quebec, because they have been cut off from their former wood supply from Quebec, does not seem to be substantiated by facts and figures.

A superficial examination of the wood, pulp and paper exports from the Province of Quebec during the last few years may have led to a conclusion in harmony with the purposes of the restrictive policy, but a careful analysis will prove that the restriction has not materially restricted, hence has not seriously diminished the wood supply of United States wood importers. Nor, has it had the effect of compelling United States pulp and paper mills to abandon their plants and to locate in Canada. On the other hand, it is perfectly apparent that pulp wood limit owners, subject to the restrictive law, when unable to establish pulp or paper mills of their own, have suffered a serious loss, through the diminution of the value of their holdings, because unable to make use of them. More than this, a direct loss has resulted to Canadian exporters of pulp, because compelled to pay a duty on all of their pulp, manufactured from wood cut on Crown lands, which would have been avoided but for the restriction placed on the exports of wood from the same lands.

A statement of wood exports for the years from 1900 to 1912 and for the six months periods of the years from 1909 to 1912 will best show the correctness of these conclusions; moreover, will give an excellent idea of the growth of the wood exports from this district. A statement of the number of cords exported cannot be given, but statements of values will afford as reliable a means for comparison as cords, inasmuch as there has not been a material advance in the value of wood since 1909.

The following tables are prepared from reliable sources, those of pulp and paper exports being added as of considerable interest in this connection:

Exports of wood and wood products to the United States from Quebec Consular District for the years from 1900-1912.

	Pulp Wood, Value	Wood Pulp, Value	Paper, Value
1900	$ 22,294	$ 19,992	.....
1901	28,908	1,113	$ 2,203
1902	90,302	.....	3,437
1903	246,536	48,218	.....
1904	302,440	121,515	1,250
1905	281,819	29,704	640
1906	239,726	22,951	1,354
1907	385,941	209,538	299
1908	636,181	230,362	45,200
1909	1,180,029	264,558	98,029
1910	1,702,642	765,133	173,561
1911	1,290,500	1,273,868	211,616

Six months' periods for the years 1909-1910-1911-1912:

	Pulp Wood, Value	Wood Pulp, Value	Paper, Value
1909	$230,757	$105,135	$ 41,243
1910	580,596	107,167	51,616
1911	318,067	350,969	106,781
1912	456,089	571,733	125,255

It will be seen from the above tables that the exports of pulp wood from the Quebec district in 1911 decreased in value by about $400,000 from 1910, when these exports amounted to $1,702,000. This, however, was to be expected, as United States importers were anxious to stock up prior to the enforcement of the restrictive law after May, 1910. This is clearly shown by the fact that such importations for the six months from January to July rose from $230,757, in 1909 to $580,596 in 1910.

The fear, however, of an impending shortage of pulp wood was apparently groundless, as is best shown by the figures of these exports for the first six months of 1912, which show a value of $456,089, an increase of $138,000 over the same period of 1911, and of over $225,000 over the corresponding period in 1909.

Judging by this, it may safely be assumed that pulp wood exports from the Province of Quebec, despite the law prohibiting their exportation when cut on Crown lands, will not suffer a serious diminution this year, and probably not for years to come, as the private forest lands of the Province, augmented from year to year by settlers' lands, free from restrictions after five years of settlement, are able to furnish on a conservative estimate from 800,000 to a million cords of wood annually.

It might have been assumed, however, that the great increase during the last few years in the exports of wood pulp from Quebec would naturally have caused a decreased demand for pulp wood, but apparently it has not, both kinds of exports having increased side by side, those of pulp at a wonderful rate of late years.

The growth of pulp exports must, of course, be most gratifying to home manufacturers, for an increase in the value of this product from only $29,000 in 1905 to $1,273,868 for 1911, bears eloquent testimony to the growth and prosperity of this branch of industry. That this is likely to continue, and that pulp exports will soon outstrip all others from the Province of Quebec, is shown best again by the figures for the first six months of the present year, which give a value of $571,733, as against $107,167 for 1910, and $350,969 for 1911.

All things considered, therefore, and in the light of actual figures, that do not lie, and which are not influenced by ulterior motives and considerations, the conclusion seems entirely justified, that the restriction placed on the exports of pulp wood by this and other provinces of Canada has not materially reduced the volume of such exports, nor is it likely to do so in the near future; on the other hand, that a removal of the present duty on the exports of paper and pulp, when manufactured from wood cut on the Crown lands, subject to export restriction, would prove of the greatest benefit to the pulp and paper industry of this and other Provinces of Canada, for the greater facilities afforded these industries, the greater their freedom from onerous restrictions and burdens, the greater will be their power of production at a minimum of cost, hence their power to offer their products in the markets of the world, in competition with all other producers.

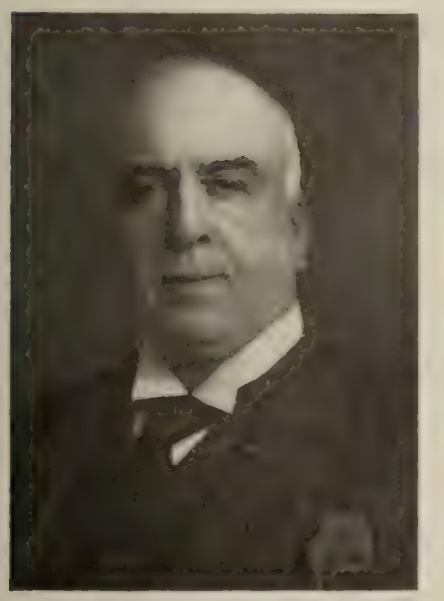
In other words, give the Canadian manufacturer the chance to produce his pulp and paper at a cost less than that in other countries, which can be done, with practically unlimited natural resources at his command in the shape of raw material and water power, and it would soon become unprofitable for manufacturers elsewhere to import raw material from Canada, which, when manufactured into pulp and paper would make these articles cost more than if imported from Quebec or other producing Provinces of Canada.

Prominent Montreal Lumber Exporters

Mr. Eustache Lemay, of Montreal, claims distinction as the largest individual lumber merchant in Canada. His activities are widespread, for in addition to doing an extensive wholesale Canadian trade, he is a large exporter to Great Britain and to the United States, and also ships to South America and South Africa. Last year he occupied the position of seventh on the list of exporters to the United Kingdom, shipping some 7,200,000 feet, while he is the leading Montreal exporter to the United States.

Mr. Lemay is of French and Scottish parentage, and was born some 64 years ago in the Quebec Village of St. Martins. He received a business training with E. B. Eddy, of Hull, and eventually was appointed manager of that firm's Montreal branch. Then, about 27 years ago, he decided to go into business for himself, and that he has made a success is testified by his extensive dealings. At first his capital was small but gradually he was able to widen the limits of his trade. He is known as a hard worker, and a very shrewd buyer. Mr. Lemay was the pioneer in bringing to the east Idaho white pine on a large scale, and to-day controls the entire output of Idaho white pine cut at Elk River by the Potlach Lumber Company, amounting to forty million feet per annum. In addition, he has the entire output of white pine of McLachlin Bros. Company, of Arnprior, Ont. The control of the output of several spruce mills in the Province of Quebec is also in his hands.

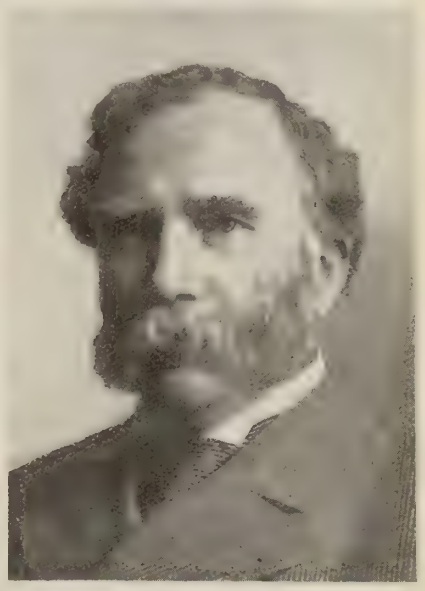
For twelve years Mr. Lemay was on the Board of the Montreal Harbor Commissioners, and to-day is a director of the Banque de Hochelaga and the Montreal "Herald."



E. Lemay

E. L. Todd

Arthur H. Campbell



G. A. Grier

Edgar Lawton Todd

Mr. Edgar Lawton Todd, the Montreal manager of Watson & Todd, Ltd., is in the true sense of the word a practical lumberman—he knows the business "from the stump." He is one of the many Englishmen who, putting aside their early prejudices, have made good in this country. Born in Yarm, Yorkshire, he came to Canada in 1891, at the age of 18, and having been connected with the lumber business on the other side, decided to learn the practical side here. This he has done, at the cost of considerable personal discomfort, for in those days camp life was not exactly a bed of roses. It has its discomforts now, but the life is tolerable as compared with the days when Mr. Todd entered the employment of the Canada Lumber Company, of Carleton Place. But he stuck to the business, even although he was early disillusioned as to its environments. He was for some time trail maker for the log cutters, and then steadily advanced until he obtained a position in the sawmill, eventually becoming timekeeper and then salesman.

In 1895 Mr. Todd represented Messrs. Watson & Todd, of Liverpool, in which his uncle is a partner, in Newfoundland; and later was promoted to the charge of the Montreal office, on the retirement of the late Mr. Martin Power, who went into business on his own account. The firm of Watson & Todd was turned into a limited liability company in 1909, when Mr. E. R. Bremner, of Ottawa, became a partner.

Mr. Todd is, in the season, one of the busiest men in the lumber trade, as his firm is the largest exporter in Canada of lumber to the British Isles. Early and late he is either in the office or superintending the shipment of lumber to the other side. He is by nature an optimist, a characteristic which has stood him in good stead in many a difficult situation.

Arthur H. Campbell

Mr. Arthur H. Campbell is the managing director of the Campbell-MacLaurin Company, Limited, Montreal, which does a large exporting business in spruce with New York City and State and the New England States. Two of the directors, Mr. DeWitt C. Culver, vice-president, and Mr. George L. Ryon (of the Skillings, Whitneys & Barnes Lumber Company) are lumbermen in the United States, and the company have also a New York representative in the person of Mr. Maurice H. Gatchel. Mr. Campbell is a native of Toronto, having been born there in 1874. He was educated at Upper Canada College and at the University of Toronto, where he was prominently identified with sports, being captain of the Varsity baseball team and a half back in the rugby team, which won the championship of Canada in 1895. On leaving the University, Mr. Campbell went into the lumber business, joining the staff of W. C. Edwards & Company at Rockland, Ont. Later he became salesman for the Robinson-Edwards Company, and afterwards manager in New York for that concern. During the ten years he resided in New York he naturally obtained a thorough knowledge of the export side of the business which has proved of great value to the Campbell-MacLaurin Company, which he organized when he left New York and went to Montreal. Most of the company's export trade is done with New York City and State.

G. A. Grier

Mr. G. A. Grier, founder of the firm of G. A. Grier & Son, Limited, is the oldest lumberman in Montreal, and a man of many activities. He was born in Cumberland, Ont., in 1849, educated at Ottawa College, and commenced his business career with Lyman & Sons, whole druggists, Montreal. But lumber proved more attractive than drugs, for after a year or two, Mr. Grier started, in 1870, in the business in which he has made such a success. He still remained in Montreal, and while doing a wholesale trade there and having a yard (which the firm still maintains), he branched out into the export business with the United States, doing a very large turnover.

In 1885 he secured a large white pine limit, with mills, in the Ottawa Valley; after running the mills for three or four years, he sold out. Mr. Grier also operated plants at Sorel and New Richmond, P.Q., and sold the latter plant and limits to Edwards & McLean. During the last ten years he has confined his attention, so far as lumber is concerned, to his wholesale business in Montreal. In this he was assisted by his sons, Mr. G. W. Grier, taking a very active share in the conduct of affairs. The firm still figures in the list of exporters to the United States. Besides being interested in real estate, Mr. G. A. Grier is president of the Diamond Glass Company, president of the St. Lawrence Flour Mill Company, and a director of the Dominion Textile Company.

Logs Ready for the Saw—J. B. Snowball Company, Limited, Chatham N.B.

Raw Material and Finished Product

Typical Lumbering Scenes at J. B. Snowball Plant, Chatham, N. B.

Lumber Ready for Shipment—J. B. Snowball Company, Limited, Chatham, N.B.

Pioneer Lumbering Firm of Chatham, N.B.

J. B. Snowball Co. Limited

One of the best known lumber manufacturing companies in the province of New Brunswick is that of the J. B. Snowball Co., Ltd., of Chatham. The industry was established by J. B. Snowball in 1872 when he constructed a mill at Chatham. In addition to occupying a prominent position as one of the chief lumber manufacturers of the province, the late Mr. J. B. Snowball took a great interest in public affairs. He was at one time member of Parliament for the County of Northumberland and also occupied at successive periods the positions of Senator for the Dominion and Lieutenant-Governor of the Province of New Brunswick.

The J. B. Snowball Company prospered from its inception and on December 13, 1899, it was incorporated as the J. B. Snowball Company, Limited, under which name it has continued ever since. The late Mr. J. B. Snowball occupied the position of President of the company and Mr. W. B. Snowball was its secretary-treasurer. Upon the death of the former president, Mr. W. B. Snowball became president and his brother, Mr. R. A. Snowball, secretary-treasurer. The company handles annually about 30,000,000 ft. of lumber, most of which is shipped to British markets in the form of deals, boards, and scantlings. The output of shingles and lath is practically all shipped to markets in the United States. Of late years a market has opened in Montreal and other Quebec and Eastern Ontario points for pine and spruce boards, as well as for low grade stock to be used in box making. This is all shipped to Montreal by rail.

The principal mill of the J. B. Snowball Company, Limited, is located in the town of Chatham and is one of the most efficiently equipped to be found in the Maritime Provinces. The equipment includes an 8-ft. single cutting band mill, manufactured by Clark Bros. Co., Belmont, New York; 7-ft. band resaw, twin rotary, manufactured by William Hamilton Co., Ltd., Peterboro, Ont.; a large gang saw which is used when there is a heavy rush of business, 2 circular resaws for taking bolts out of slabs, a 2 saw trimmer, edgers, a 5 saw bolter manufactured by the Diamond Iron Works, Minneapolis, Minn., and 2 lath machines of 60,000 and 40,000 daily capacity.

A box manufacturing plant is also conducted in connection with this mill, the equipment being as follows: one Perkins automatic splitter, one Fisher heading machine, one Berlin equalizer, one Berlin jointer and a cutting-up saw. This plant is equipped to manufacture all kinds of rough shooks for the fishing industry.

The mill and box plant are run by steam power, the equipment including an inclined double engine capable of producing about 450 h.p., a horizontal double engine capable of about 250 h.p., a battery of 6 boilers 18 ft. long and 72 in. in diameter, dutch ovens and a refuse kiln at the end of the dutch ovens. A covered burner is installed with a brick chimney 400 ft. from the mill.

Conveyors Carry Stock to Yards

One of the most interesting features in connection with this will is the conveyor system by means of which lumber is carried to the yards. Lumber is taken from the mill by conveyor running the full length of the yard. The conveyor makes a right angle turn and carries part of the stock across the street where it is also piled. All of the lumber is piled according to widths. After it has passed the turn in the conveyor it is selected by hand and dropped to the different piles. Portable runs are used for conveying the lumber from the piles to the vessels.

The J. B. Snowball Company, Limited, also operates a mill about a mile up the river from Chatham. The equipment consists of 2 boilers 5 ft. in diameter and 16 ft. long, a Leonard engine of about 200 h.p. capacity, rotary saw, edger, trimmers, slasher saws, 2 shingle machines, a Berlin planer, and a lath machine. The output of this plant is about 30,000 ft. of lumber, 15,000 lath and 26,000 shingles per day.

A third mill operated by the J. B. Snowball Co., Ltd., is known as the Derby mill. This is still further up the river and has practically the same equipment as the mill previously described.

At Tracadie, about 45 miles down the river, the J. B. Snowball Company, Limited, operate a mill equipped with a live gang saw, with capacity of about 50,000 ft. per day. A rotary of the same capacity, edger, trimmer, wood cutters, 3 shingle machines with total capacity of about 42,000 per day, a Goldie McCulloch planer, etc. The power plant consists of a double inclined engine with capacity

Where the Lumber is made—Twin Rotary and Gang, J. B. Snowball Co. Ltd., Chatham, N. B.

Vessel at Dock—J. B. Snowball Co., Ltd., Chatham, N. B.

of about 400 h.p., dutch ovens, and three boilers. In all of the mills the boilers are of the tubular type.

Unique Manufacturing Conditions

A number of interesting features in connection with the operations of the mill at Chatham have been introduced by Mr. Snowball. One of these, which is a most important factor in the economical running of the mill, is the installation of a hand resaw which is used for removing the bad side of any log and thus saving all the merchantable quality.

Another feature is the fact that in running the edgers two men are stationed on one side of the machines as it is important that the edger-men should be given ample time to inspect and take the most out of the lumber which passes through their hands. A similar practice has been adopted in connection with the trimming. Two men are stationed where the manufactured lumber passes through the first saw, to handle it and trim it to the best advantage. On the surveyor's side 4 men are stationed to mark the length and breadth and class of the lumber and indicate the point at which it is to be trimmed.

Extensive Timber Resources

Another feature of great importance in connection with this mill is the fact that the timber limits are so located that logs can be conveniently brought to the mill at all times. Part of the timber comes from the north and south west branches of the Miramichi and a large portion comes from the Tabusintac on the north side of the Miramichi, and from the Bay Du Vin on the south side. The timber limits controlled by the company cover some 412,160 acres all of which is well wooded, produces an excellent class of logs and is held under lease. The greater part of the timber is spruce with a small amount of pine, hemlock, cedar and hardwood. The woods operations are especially favored inasmuch as the limits are surrounded by good farming districts from which capable labor can always be secured. The products of the farms moreover are bought at reasonable prices for camp supplies, thus saving heavy expenditure in transportation. The limits are capable of producing 30,000,000 ft. per annum upon their natural growth.

All the mills of the J. B. Snowball Company, Limited, have railroad sidings by means of which shipping can be done direct from the mills by rail.

The company employ at their various mills about 505 men.

The shipping facilities by water at each of the mills are excellent. At the Chatham mill for instance 55 ft. of water is available at the wharf, so that the largest vessels can load alongside without any difficulty whatever.

It will be realized from the above description that the company have an excellent series of plants for the production of lumber and that their manufacturing methods are worked out upon the most modern lines. The accompanying illustrations give a good idea of the extent of the plant at Chatham and of its excellent shipping facilities and booming grounds.

Reports from Ottawa state that a material increase has been made by United States railroads in their lumber rates on shipments to Ontario and Quebec points, and also to a number of points in Western Canada. The increases vary from 1c to 5c per hundred pounds and the ratings have been filed with the United States Interstate Commerce Commission. The Canadian Lumbermen's Association are giving the matter their serious attention. It is probable that, upon their recommendation, the question will be taken up by the Dominion Board of Railway Commissioners. Considerable difficulty is experienced in dealing with a case of this nature which involves a through rate, because the authority of the railway commission applies only to Canadian railways. Recurring cases of this nature have suggested the advisability of forming a joint international commission to regulate through rates. Negotiations looking towards this end have been held between representatives of Canada and the United States. Unfortunately, they have been, so far, without results. It is expected that the proposal will be brought up again this Fall.

A pulp mill with a capacity of 400 pounds a day, is expected to be erected in Renfrew shortly by M. J. O'Brien.

Montreal as a Lumber Shipping Port

Distributing Canada's Output of Wood Goods to Many Foreign Markets—Its Extensive Shipments to Great Britain—The Influence of Foreign Competition

(Specially written for the Canadian Lumberman)

From its position as Canada's greatest commercial port, Montreal naturally does the largest export lumber business with Great Britain. Of late years, owing to various causes, the tendency has been towards smaller shipments, those of 1911 showing a falling off of 12,882,176 feet, with a total of 103,473,220 feet. There are three main reasons for this continued decline in exports—the impossibility of getting the higher grades, a stronger domestic demand, and competition of Baltic goods.

The firms doing the largest trade—Watson & Todd, Limited (who have been for several years at the head of the list) and Robert Cox & Company—have their head offices in Liverpool, while Cox, Long & Company have their head office in London. W. & J. Sharples, J. Burstall & Company, and Dobell, Beckett & Company, are all city of Quebec firms with offices in Montreal; T. Mackarell & Company have their head office in Ottawa; while Mr. E. H. Lemay and Mr. E. N. Nicholson are big shippers with their own offices in the city. With the exception of the firms mentioned with British offices the Montreal exporters ship their goods to the other side to wood brokers who sell on a commission basis.

A Wide Variety of Shipments

White and red pine and birch comprise the great bulk of the cargoes sent to Great Britain. At one time a good deal of spruce was exported to Great Britain, but this trade has declined and is now done chiefly from Quebec and St. John, N.B. In the last few years Canadian woods have been subjected to strong competition, particularly our red pine. The rise of the Russian trade has meant decreased shipments from Montreal, as Baltic red pine is sold at a price which makes it very difficult for Canadian descriptions to compete. The freight is cheaper, lumber more abundant, and labor poorly paid—three factors of vital importance. In special lines Canadian red pine holds its own, while our white pine practically has the market to itself, as it cannot be touched by other woods. The falling off in general shipments has been largely confined to British Channel ports.

In birch, boards, planks, and logs are exported to the United Kingdom and a little to South Africa. So far this year there has been a good supply, and prices have stiffened; our lumber has to meet competition from European countries, but as Quebec birch is, as a rule, of superior quality, there is every probability of quotations being sustained. As a matter of fact, Quebec birch commands higher prices than other descriptions, including those which come from the Lower Provinces. The chances are all in favor of higher values in the future, as the lumber will cost more to produce, owing to all the standing timber within easy access of the railways having been cut. This involves going further back for supplies, which naturally adds to the expense. While planks and boards have gone up in price in recent years, birch logs have not appreciated to extent. The principal reason for this is that logs will not keep in Canada, and that when, as sometimes happens, more logs are got out than are wanted, they have to be thrown on to the market, with the result that prices are not sustained.

Difficulties Confronting the Trade

Apart from outside competition, Montreal shippers have difficulties of a local nature to contend with. To begin with, some general merchants on the harbor front are woefully behind in their warehousing accommodation, which makes for delay in the shipping of goods, and thus to a certain extent handicaps lumber dealers and others who are anxious to get prompt shipment. Then, too, lumbermen complain that they are not given sufficient facilities for unloading cars at the harbor. When a car of lumber is consigned to an exporter, it is shunted on to an outside siding at the harbor, involving time and cost for the goods to be unloaded and carried either inside the shed or on to the wharf. It is contended that the cars should be run alongside the sheds, and then unloaded right into the sheds, instead of the lumber having to be carried across the harbor front. Through consignments are allowed to be unloaded at the sheds.

Up to this year, the big shippers were discriminated against in the matter of steamship rates. With the object of encouraging small consignments from the West, the steamship companies gave a rate per 100 lb. which was denied the large exporters, who had to pay the rate per standard. This resulted in small amounts of lumber being carried at a lower rate than the large consignments; naturally protests were made, and this year the 100-lb. rate has been abolished and the rate per standard substituted for all lumber.

So far this year trade has been good, with indications of exports keeping up to the level of 1911. In the early part of the season there was a good deal of difficulty, on account of the lighter troubles in England, and also on account of the great advance which has been made in ocean freight rates. This matter of ocean freight rates has been a most detrimental factor in connection with the Old Country lumber trade. Freights to-day are some 10s. higher than they were a year ago, shippers being obliged to pay 40s. a standard, whereas a year ago they had to pay only 30s. It is clear that this charge has to be added to the cost of the goods, and that it is a serious item, having regard to the keen competition of Russian lumber with certain of our products. It increases the disadvantages under which we are fighting this competition; and although the consumer will have to pay in the end, the additional cost of the goods tends to lessen the consumption.

The trouble with the lighter men entirely crippled the transport business to London for a time. The C. P. R., which, during normal periods, has a vessel a week from Montreal for London, was unable during the second week of June to offer a vessel out of Montreal for London until the end of the first week in July. At that time many vessels were reported at London lying idle with their loads of lumber on board. These vessels being withdrawn from trade for the time being, stopped the shipments for the port of London. Liverpool, fortunately, was not so seriously affected by the lightermen's strike, and shipments continued to that port at a steady rate. The car shortage was also a disturbing factor, as it was impossible to get goods for some time, while the wet weather in May retarded shipments for a short period.

An interesting feature in connection with the export trade from Montreal is the business which is being done by some exporters with European ports. Vessels from Montreal, for instance, frequently leave, which are to call at London and Antwerp; this makes it possible for Montreal shippers to look for business in Antwerp. One firm of exporters in Montreal is now selling to Antwerp about 1,000,000 feet a year of the highest grades of lumber, having been able to work up a very good demand for Canadian lumber.

Export Trade to the United States

Although no figures are available showing the total amount of the export trade in lumber from Montreal to the United States, inquiries show that it is of very considerable importance. Apart from the lumber re-shipped from the city, there is a large trade—in fact the far greater proportion—which is done through various wholesalers, the orders being executed at the mills and sent direct to various points outside the country.

This year trade with the United States has shown a welcome revival. The market is in a very healthy condition, with prices very firm. The principal exporters report that the demand this year is abnormal, and that it has not been confined to any particular descriptions of lumber. Following the panic in 1907, business dropped off, and continued to decline, with smaller prices, until this year. One effect of the poor state of business over the border was the importation here, at low prices, of Southern lumber, the home market being unable to take care of its products. Since January, however, a more cheerful feeling has pervaded markets, and there has been a growing demand for Canadian lumber in the United States. Quotations for spruce have advanced, while white pine, Norway pine and hemlock have been on a firmer basis. Although the increased inquiries have exercised a certain influence on the upward range of values, the chief cause is the closing down, during the lean period following the crisis of 1907, of a number of Southern mills, which were unable to operate at a profit at the prices which obtained. Another cause contributing to the advance was the severe cold weather during the past winter, which interferred with the Southern mills operating, thus reducing the output. Further than that, the high water and floods during the spring caused a lot of trouble to Southern manufacturers. This reduced their cut materially, the result being that quotations of Southern wood advanced from two to five dollars per thousand feet as compared with last year. Canadian exports to the United States comprise chiefly, spruce, white pine, lath, and cedar shingles. Greater New York is naturally the largest market, the lumber being shipped during the season by canal boats. These are towed down the St. Lawrence to Sorel, and from there up the Richelieu River to Chambly, where they strike the Chambly Canal. They are then towed by horses, and go through Lake Champlain to the Northern Canal, on to the Hudson River, and so to New York, the journey taking from 18 to 21 days.

Lumbering and Pulpwood Operations of the Davison Lumber Company, Limited—Factors of Success

EIGHTY miles from Halifax, on the line of the Halifax and South Western Railway, one comes to the delightfully situated town of Bridgewater, a busy and prosperous manufacturing and distributing center. Among the chief products of the town are lumber and pulp wood, and among the numerous firms manufacturing these, the largest and most important is the Davison Lumber Company, Ltd., which took over in 1903, as a going concern, the business of E. D. Davison & Sons. The stock of the company is held entirely by Pittsburg capitalists, the president being Mr. J. M. Hastings of that city. Mr. Hastings is also president of the J. M. Hastings Lumber Co., and of the Commercial Sash and Door Co., both of Pittsburg, Pa., and is also a director in several banks and other large concerns.

The company own large timber resources, including over 200,000 acres of timberland in the counties of Kings, Queens, Annapolis, and Lunenburg, all in Nova Scotia, the timber upon which consists chiefly of spruce and hemlock with a good percentage of white pine and good hardwood. Their manufacturing plants include the following:

Two water mills at Bridgewater, N.S., with a daily capacity of 30,000 and 40,000 feet respectively.

One steam mill at Hastings, N.S., with a daily capacity of 140,000 feet.

One pulpwood rossing plant at Bridgewater with a daily capacity of 60 cords.

The two water power plants at Bridgewater are equipped with gang mills and are said to be the most cheaply operated plants of their kind in the country. The output from these mills is rafted and towed about one mile down the Lahave River to the company's large lumber docks where it is piled and seasoned for shipping direct from the piles to the vessel.

The steam saw mill at Hastings is equipped with one single cutting band; twin bands for slashing for the gang; one large gang saw, and one band resaw. The machinery in this mill is modern and up-to-date in every respect. It includes also planers, short boxboard cutting-up machinery, and lath mills. The plant is provided with a complete sprinkler system and other modern fire fighting appliances; a battery of 6 boilers of 125 h.p.; one 600 h.p. engine, and one 150 h.p. engine driving the gang. The equipment also includes a complete electric light system for the mill, yard and houses, as well as machine shops for making all necessary repairs. Thirty million feet of lumber can be piled in the yard, and railroad switches at the back of the piles provide convenient facilities for loading.

The lumber is conveyed on cars over the company's own line of about one mile, from the mill to Hastings Junction where it connects with the Halifax and South Western Railway. It is then transported 27 miles to Bridgewater where it is loaded upon vessels for shipment to foreign markets.

Near the mill site are located the company's offices, 31 houses for the use of employees, a large cook and sleeping house to accommodate 150 men, and church and school buildings. The mill is located on Springfield Lake which has a storage capacity of forty million feet of logs. All the logs are delivered to this mill by rail over the company's logging railroad.

The woods department is located at Crossburn which is 10 miles above Hastings and 37 miles north of Bridgewater. This department

Shipping Scene—Davison Lumber Company, Bridgewater, N.S.

Hastings Sawmill—Davison Lumber Company

is in charge of Mr. J. W. Cross, woods superintendent. At this place are also located large warehouses, commissaries, machine shops, roundhouses, large storage houses for construction equipment, and twenty dwelling houses.

The Davison Lumber Company operate over 40 miles of their own logging roalroad, which is equipped with three straight-connected locomotives and two general locomotives, three steam log loaders, one steam shovel for construction work, one snow plow, sixty standard logging cars, and other modern equipment.

For their logging operations and for use about the yards, the company keep 150 horses. They also own a number of cattle, pigs, etc., and are raising on their own farm, grain and vegetables in addition to hay, all of which simplify greatly the problem of securing supplies for the employees in camps and at the mills.

All the camps located along the line of the railroad, and the houses at Crossburn, are built on the portable plan and can be loaded on cars and moved where desired. An interesting feature of the company's method is the fact that they operate their own telephone system which permits of communication between headquarters and the mills and camps. The towns of Hastings and Crossburn have every facility which the average small sized town possesses, such as post offices with money order and registered letter departments, churches, schools, athletic associations, circulating libraries, etc.

At Bridgewater, about 12 miles from the mouth of the Lahave river, the company own a large number of shipping docks which will accommodate vessels drawing 20 feet. Vessels of deeper draft are loaded about a mile below these docks where about 30 feet of water is available.

The Davison Lumber Company export from six to ten million feet of spruce to South American ports annually. The hemlock and a large portion of the pine is shipped to the United States, and pine and spruce are also shipped to the West Indies. The annual output amounts to from forty to fifty million feet, the production of which gives employment to from 800 to 1000 men all the year round in the different departments. The headquarters of the company are located at Bridgewater where Mr. D. H. Foresman is resident manager.

Newfoundland's Timber and Pulp Trade

Wonderful Story of the Ancient Colony's Recent Development Briefly Told in Facts and Figures — Value of the Industry to the People

By M. S. Sullivan

AT the present time two mills only are manufacturing lumber in Newfoundland for the export trade. While not wishing to be looked upon as possessing unparalleled timber resources, yet this little colony holds undoubted forest wealth, whose development in the past, as well as the present, has helped to increase the quantity and value of its exports,—at the same time catering for all local requirements.

The lumber industry has been a source of employment for hundreds of men during a time when they were not required at their other avocations. Quite recently it has been demonstrated that large timber tracts unsuited for lumbering can be advantageously used in the pulp and paper business.

The best timber is found chiefly in the valleys and around the lakes. As one goes back towards the high land the timber becomes of a smaller and more stunted growth. Where timber has been thinned by judicious cutting in thick groves the remaining trees grow much better and attain to a greater height. There is a considerable variety of timber, including white birch, yellow birch, black spruce, white spruce, red spruce, fir, juniper, witch hazel, aspen, pine, etc.

The pine is of a very superior quality, and is really the backbone of the lumbering industry. Newfoundland pine brings good prices in the United States, English, and South American markets. Spruce is used locally for rough building work, and is now being cut in enormous quantities for pulp wood. The Newfoundland spruce is supposed to be just as good as the Canadian and United States varieties for the pulp and paper business.

Statistics of the Lumber Industry

The government returns for the fiscal year 1910-11 show that during that time 286 lumber mills were in operation, with a total output of 53,187,000 f.b.m., valued at $797,805. Of this 53,187,000 feet, fifteen mills cut 23,342,000 feet; the remaining 271 mills only 29,845,000 feet. The 286 mills employed 4,000 men for about six months. Allowing an average wage of $26, we find that the lumbering industry paid out in wages $624,000. Add to this the amount of $584,000 expended by the Anglo-Newfoundland Development Company, Limited, for cutting pulp wood, and the amount expended by the A. E. Reed Company, Newfoundland, Limited, of Bishop's Falls, for their pulp operations, and the very considerable amount is reached of $1,208,000 paid out to the laborers of this colony in six months for one industry alone, in a country which has only a population of 250,000 people.

According to the official statistics of lumber exports there has been a decline since 1906-7. The totals for five years are as follows:

	Lumber Exported Feet	Valued at
1906-7	18,614,000	$326,581.00
1907-8	16,235,000	236,914.00
1908-9	5,896,000	84,459.00
1909-10	7,707,000	144,666.00
1910-11	6,085,000	125,279.00

This is not the result of the timber suitable for export being cut out. The reason is, that the product of several of the areas which were formerly cut for lumber has now been diverted into the pulp and paper business.

At a rough estimate, the value of the lumbering industry to the colony must be in the vicinity of $900,000; and the pulp and paper industry nearly $2,000,000 annually.

Growth of Pulp and Paper Business

In Newfoundland to-day there are two of the finest, if not the finest, pulp and paper mills in the world. The plant at Grand Falls (which is owned by the Anglo-Newfoundland Development Company, Limited) is capable of turning out 60,000 tons of newsprint, and 33,000 tons wet weight ground wood pulp annually. The pulp mill at Bishop's Falls (owned by the A. E. Reed Company Newfoundland, Limited), which is financed by English capital also, has a capacity of 60,000 tons wet weight ground wood pulp annually.

The Anglo-Newfoundland Development Company will cut annually about 130,000 cords pulpwood for their plant at Grand Falls; and probably 30,000 cords will be required by the A. E. Reed Newfoundland Company at Bishop's Falls.

Other pulp mills are being talked of. One is now under construction at Campbellton, Notre Dame Bay. It is owned by the Horwood Lumber Company, Limited, of St. John's, Newfoundland. They have lumber mills at Campbellton and Dog Bay, and intend using their new pulp mill at Campbellton to take care of wood from their limits which would be of better value made into pulp than manufactured into lumber.

Another very large pulp and paper mill is expected soon to start construction work at Deer Lake, on the west coast of Newfoundland. Legislation has already been passed, conveying certain rights to a United States company who propose to go into the pulp and paper business there.

Seven years ago, where the mills and town of Grand Falls now stand, there was a wilderness, without an inhabitant. To-day it has a population of over 2,000 people, living in comfortable homes, many of them with all modern conveniences. A splendid system of sanitation has been established and electric light and filtered water are provided in every home. The pluck and foresight of the Harmsworth Brothers of London cannot be too highly commended for embarking on such an undertaking in what was then an unknown country. Their example has since been followed by the A. E. Reed Newfoundland Company. These two companies have now made manifest to capitalists that their enterprise in starting the pulp and paper industry in Newfoundland was amply justified.

Newfoundland's Industrial Advantages

One of the reasons which doubtless influenced English capitalists to come to Newfoundland to start their enterprises was that Newfoundland was one thousand miles nearer to England than the parts of Canada and the United States where news-paper is manufactured. It was also ascertained that there was practically an unlimited supply of pulpwood,—principally spruce and fir,—a very large percentage being spruce. Also, there was an abundance of labor to be had for pulp and paper making, and for other industries.

It was claimed, when the project was first discussed, that they could not make paper in a country where the people were fishermen only, as they would never give up the fisheries to become mill men; and, even if they did, would never be successful at it. At the present time 97 per cent. of the employees of the Anglo-Newfoundland Development Company are Newfoundlanders. The work they have done

since the mill started proves that these untrained Newfoundland fishermen can become first-class workmen in every department of the plant.

Previous to 1909 there was no pulp and paper exported. Since then it has added considerably to the colony's exports. In 1909-10 there were exported 13,993 tons pulp, valued at $76,304; 1909-10 there were exported 7,866 tons paper, valued at $357,155; 1910-11 there were exported 21,170 tons pulp, valued at $251,048; 1910-11 there were exported 21,064, tons paper, valued at $943,699.

The export of pulp and paper in 1912-13 should be, approximately, $2,500,000.

Newfoundland possesses many fine water powers yet undeveloped; and several hundred square miles suitable to the pulp and paper business. The time is probably not far distant when the colony will take a leading place in supplying pulp and paper to foreign markets.

Porcupine Trail Timber Resources

Spruce the Most Extensive Growth—White Pine, Jack Pine, Birch and Poplar also Found in Moderate Quantities

The timber resources along the trail line between Gowganda and Porcupine, Ont., are referred to in the annual report of the T. & N. O. Railway Commission as follows:—

Except in parts recently burned the district is well forested. Stony areas or those with a soil composed of glacial material containing many boulders, which in this district are the most extensive, produce a mixed growth comprising the various conifers together with birch and poplar. The sand plains are covered chiefly with jack pine. Flat areas and the parts along the water courses are wooded chiefly with spruce and cedar.

White and red pine are the most valuable trees, but their distribution is not extensive, and they grow only on the high ground where they are most liable to be destroyed by fire. Some good blocks found on the ridges about Duncan lake have already been partially destroyed. Similar blocks and patches on the high ground in the western part of McArthur township have suffered from the fires of the last two summers. Scattered trees are to be found among the other timber on most of the higher ground. Jack pine has the widest distribution of all the trees, growing as it does with the poplar and birch on the high stony ground and with spruce on much of the low ground. Spruce grows everywhere, but is most plentiful along the streams and lakes. Strips of country wooded chiefly with birch and poplar are probably burnt areas of half a century ago. A strip one to two miles wide, west of Mount Sinclair in the townships of Montrose and Hutt, extending as far as the recent brule alone the Grassy river is likely one of these areas.

The largest area of spruce lies along the North branch of the Grassy river. At the boundary of Hutt and Zavitz townships, this area has a width of a mile on either side of the stream. From the top of Mount Sinclair the whole country from Seven-inch lake northwest to the Redstone, as well as that along the Grassy to the south appeared wooded with conifers. As there was no opportunity of examining this part in detail, it is difficult to form an idea of the proportion wooded with jack pine and that wooded with spruce.

The north-western part of Zavitz township, for a mile east of the Redstone and north to the lakes on the boundary is mainly old brule and windfall. The central part of the township is wooded with spruce and mixed timber in alternating strips according as the ground is high or low; but for a mile west and north-west of Kitchimine lake in the north-eastern part, the timber has been burned or blown down.

The country about the south end of Mushkasenda lake, for two miles to the east and two to the south, consists of sand plain wooded with jack pine mostly under a foot in diameter. The canoe-route leading to Sinclair lake was followed to the south through eight or nine miles and the connecting portages, starting with two small lakes and portages of twenty, ten and five chains. On the shore of the next lake which is irregular in shape and two miles long, the only rock seen out-cropping through this glacial sand occurs as a hill of greenstone. About this lake in the southern part of English township, there is a good growth of mixed timber, with some patches of thrifty young red pine. The lakes on the route in Semple township are surrounded by a sand area, timbered chiefly with young birch and poplar.

The part between Peter Long's lake and Mushkasenda was burned in 1908. This burning may have extended through Musgrove into Bartlett and McArthur townships, as brule of about this age crosses the Musgrove-Bartlett line and extends for about six miles northward along the lakes and creek. The advent of the prospector has greatly extended these burnt areas in the last two years. So fierce have been the fires of this year that in the townships of Deloro and Shaw even the timber in the swamps has been destroyed. It seems unfortunate that such large areas of timber should be burned for lack of that knowledge of woodcraft which has preserved them as forest for so long a time.

A very small proportion of the timber of this district is of mature age. On the eastern slope of the Mount Sinclair ridge, white pine thirty inches in diameter and spruce a century and a half old are quite numerous. In the ravines running down the slope the cedar are also of large size. Many of the pine trees scattered through the other timber on the high ground, and occurring as clumps among it, appear to be remnants of an earlier forest growth, for none of the other trees are over a century old. The scattered nature of the pine, and the fact that in the northern townships where it is most accessible, the best has already been destroyed, greatly reduces its value. On the whole, the areas of spruce must be considered the best resource in timber of the district.

Two water powers are being developed to supply power to the mines at Porcupine; one on the Mattagami river at Wawaitan Falls, and the other at the High Falls on the Grassy river. Both of these provide a head of 100 feet, and an ample supply of water for the development of a larger number of horse power than will be required for some years to come. The thirty-foot fall on the Grassy in Musgrove township and Kenogamissee Falls on the Mattagami, thirty miles above Wawaitan Falls, are other available sources of power. The areas of spruce timber suitable for pulpwood along the Grassy river and its tributaries, and in lesser extent along the other rivers of the district, are a source of wealth immediately available with the aid of these water powers.

Cooperage Conditions During 1912

Stocks Reduced by Bad Weather and Scarcity of Timber—Only 75 per cent. of a cut—Changes in Woods Used for Stock

Written specially for the Canada Lumberman by James Innes

Cooperage stocks put in at the mills throughout Canada last winter were very light, partly owing to the bad weather in February and March, and partly owing to the growing scarcity of timber, suitable for cooperage stock, in proximity to the mills. Quite a number of mills have gone out of commission entirely this year, that were running last year—while we do not know of a single new mill having been built. As near as can be estimated, there will not be over 75 per cent. of the amount of cooperage stock manufactured this year that was made last year.

Elm, which is the principal timber used for staves and heading, is becoming scarcer every year on account of there being a good demand for elm lumber. Prices of standing timber and logs have advanced nearly 50 per cent. during the past three years. While the output is decreasing, the consumption is increasing. The consequence is, that very little stock is now being exported, in comparison with what was shipped out to the United States and foreign countries a few years ago, the home market consuming the bulk of the stock that is made, whereas a few years ago the exports were double the amount of home consumption.

Experiments are being made with other woods for the manufacture of staves and hoops, and undoubtedly birch will cut a considerable figure in future, in the cooperage business. Basswood is almost a thing of the past for heading, but there is still plenty of other timber suitable for heading which makes just as good heads if properly manufactured. Balsam, spruce, maple and birch will be used almost exclusively for heading in the future.

There is more flour being put into wood at the present time than there ever was in the history of Canada. The use of barrels for sugar, which had dropped considerably, is increasing again, as the barrel is found to be the best possible package for sugar, especially where it is to be shipped any long distance and is in danger of contamination from other products. There is also more lime and more cement being put into barrels than in any former year, while the apple trade is also using more barrels. The estimate of the Chief of the Fruit Division at Ottawa this year is that a million more barrels for apples will be required than were used in 1911. While British Columbia ships most of its apples in boxes, the other provinces barrel their apples almost entirely. As for winter apples, it has been found that the barrel is the only safe reliable package that will carry the apples in good condition and preserve them for winter use. The present prospects are that the consumption of cooperage stock will go on increasing, and it is therefore necessary for the manufacturers of stock to obtain a substitute for elm for their staves and hoops, the same as they have done in getting a substitute for basswood for heading.

There is ample timber in the north for the manufacture of cooperage stock for years. It is only a question of having it properly manufactured, and put on the market in good condition, and there is no reason why the northern woods will not take the place of elm almost entirely.

Behind The Moulders—Estate James Davidson Plant, Ottawa

A Great Woodworking Industry

Estate James Davidson, Ottawa

A Nest of Machines—Estate James Davidson Plant, Ottawa

Notable Ottawa Woodworking Firm

Remarkable Achievement in Industry Building as Illustrated by Plant and Equipment of Estate James Davidson—History of the Business

In the passing of James Davidson in October last, Ottawa lost one of its most prominent manufacturers, and a citizen who was held in high esteem by all classes. The life of Mr. Davidson was a fine example of what may be accomplished in Canada by a young man's unaided exertions. Buoyant, courageous and enterprising, he began life amid many obstacles to success, but, blessed with a cheerful optimism and unfailing energy, he had risen while yet in the prime of life to be one of the most prominent and successful public men in Ottawa. In addition to being head of one of the largest manufacturing firms of its kind in the country, he was and had been for years past one of the four controllers of the city.

Born in Ottawa in 1855, the late Mr. Davidson was found early in life working in the sawmills of that place. In 1874 he started in the milling business at Mount Sherwood with his brother and stepfather. It is worthy of note that in this first venture the wheel operating the saws was turned by hand. Even though its appliances were primitive, the business began to grow, and soon a greater market for its larger output was needed. In 1878 the late Mr. Davidson left for Liverpool, where he remained seven years; advancing the interests of the firm. Meanwhile, the factory had been extending and the work of door and window making was commenced, which, to-day, is the principal part of the business. Three times the factory was wiped out by fires which entailed direct losses of over $250,000, but, nothing daunted, the late Mr. Davidson and his brother-in-law, the late Wm. Thackeray, rebuilt it three times. After the 1903 fire the factory was moved to its present site, at the corner of Albert and Rochester streets. It was operated for a time by the firm of Davidson & Thackeray, but upon the death of the latter member, seven years ago, was carried on by the late Mr. Davidson alone.

On Mr. Davidson's death, the management of the plant was taken over by the eldest son, Mr. Grant P. Davidson, a young, energetic man, who will carry on to further success the extensive business his father founded. He is ably assisted by two trustees, who have had long experience in this class of business, Mr. Leander Henderson, superintendent of the sawmill and factories, who has been connected with the firm for twenty-six years, and was the late Mr. Davidson's right-hand man. He was formerly in the employ of Wm. Cane & Company, of Newmarket, Ont. Mr. A. G. Rose, the secretary-treasurer, has been connected with the firm for over twenty-eight years, having always attended to the financial end of the business, and being an expert accountant.

The timber limits now owned by the company consist of some 150 square miles, situated on both sides of the Coulonge River and heavily timbered with white and red pine, spruce, cedar, basswood, oak, birch, maple and ash.

The sawmill is situated at Davidson, Pontiac, Quebec, at the junction of the Coulonge and Ottawa rivers and on the line of the Waltham Branch of the C. P. R., about eight miles above the City of Ottawa. This village was established in 1900 as the result of the lumbering industry carried on by Davidson & Thackeray, of Ottawa, and now controlled exclusively by the Estate. Here are located the buildings and other necessary facilities, including saw, shingle and lath mills, offices, workmen's house, stables, ice-house, blacksmith shop, boom house, private railway station, railway sidings, etc., all built in a sixty-acre reserve. Outside the mill property is the general store, post office, Dominion Express office, hotel, etc., controlled by private parties.

The mill is equipped with two circular saws and a gang as well as lath and shingle machinery, with an output of 85,000 feet per day. Power is furnished by a battery of four boilers 6 x 16 feet, one 250 and one 125 h.p. Waterous engine.

The Factory

Most of the lumber manufactured at Davidson is utilized in the immense woodworking plant at Ottawa. The factory at Ottawa, as it stands to-day, was completed in 1905 and is a monument to the enterprise and genius of the late Mr. Davidson. It is without doubt one of the largest and most modern woodworking establishments in Canada. The capacity of the door department is a door a minute. This, however, is only one branch of the business, as the manufacture of sash, blinds and mouldings, flooring, sheeting, boxes and box-shooks, clapboards, stair work, refrigerator and toboggans is very extensively carried on.

Four acres of ground are occupied by the factory and warehouse buildings, including lumber and stock sheds. It faces on the tracks and terminals of the Canadian Pacific and Grand Trunk Railways, giving ample opportunities for unloading cars. The mill, dry-houses, and engine and boiler houses are constructed of brick and are as nearly fireproof as it is possible to make them. The plant and offices are also equipped throughout with an automatic sprinkler system, installed by the Vogel Company of Canada, Limited, Montreal.

The power house is of brick, 40 x 60 feet. It contains a Goldie & McCulloch latest improved Corliss 25 x 48 engine of 750 h.p. and five large boilers 6 x 16, manufactured by W. G. Campbell, of Ottawa, is equipped with Fleming Hollow Grate Bars and a special design of furnace for burning shavings, cuttings, etc. A part of the power house consists of a shavings vault 60 feet high and 40 x 30 feet. On top of the shavings vault is a separator eight feet in diameter and 16 feet high and another on the main mill is 12 feet in diameter. These separate the sawdust from the shavings. The sawdust goes into bins directly over the boiler.

The mill proper is 300 x 200 feet, with an "L" 75 x 200 feet. The dry-houses are 75 x 100 feet. One lumber shed is 22 x 400 feet, while the moulding building is a double shed 80 x 200 feet. The stable is 24 x 70 and has accommodation for twenty horses. There are private

A. G. Rose, Secretary-Treasurer

Leander Henderson, Mechanical Superintendent

Door Department—Estate James Davidson Plant, Ottawa

Main Corridor—Estate James Davidson Plant, Ottawa

sidings on the Canadian Pacific and Grand Trunk railways. From these sidings wagons are loaded with material incidental to the sash and door business, which goes directly into the dry kiln. This dry kiln, which, like the mill and office, receives its heat from steam supplied by the boilers, has a capacity of 100,000 feet. It was installed by Sheldons, Limited, of Galt, Ont. From the kiln, the doors of which open immediately into the factory, the lumber passes through a No. 90 new Berlin Fast Feed Double Surfacing Machine. From this machine it progresses rapidly to others, all set and arranged so that the material is handled without loss of time or waste of motion. Passing from the planers it is transferred to some of the several rip or resaws via automatic tables where cut-off saws divide it into desired lengths, and from there to others of the numerous machines which fill the main floor of the building. Much of the finished produce is manufactured almost entirely by these machines, tended by skilled machine hands. Other work may, however, be so elaborate and delicate in its nature that it must be executed mostly by hand and for this work a large number of skilled bench hands are required.

The blower system, installed at a cost of $7,500, consists of numerous pipes so arranged that the dust, shavings, etc., are drawn into them directly from each machine and by suction drawn into main pipes leading to a reservoir known as the "cyclone," from which the waste is automatically fed to the furnaces. Heat goes through all buildings and office. The heating and blower system was installed by the B. F. Sturtevant Company of Boston. It includes a standard 150-inch fan of the three-quarter housing type, driven by horizontal centre crank engine having seven-inch cylinder and arranged to draw the air through a heater containing twelve standard four-row sections. The air is distributed first through an underground tunnel and thence discharged into an overhead system of galvanized iron piping, carried in each wing of the building. The most important feature of this system is that all of the heating surface is massed in a single casing placed entirely outside the building, and a forced circulation of warm air is secured through an extended system of overhead piping with its downward discharging pipes.

In the "L" on the main floor are located the heating and glue rooms. These are equipped with more than the ordinary amount of steam heated pipes, warmth being a requisite for successful glue work, of which much is done in the production of fine veneered material.

The Planing Mill

The equipment of the planing mill consists of one No. 90 Berlin Fast Feed Planer and Matcher with complete equipment of profiling attachments, and one special hardwood flooring machine made by Hoyt & Brother, Aurora, Ill. Connected with this machine is a self-operating cross-cut saw and an end matcher. In this department are also a large re-saw made by the W. B. Mershon Company, Saginaw, Mich.; an S. A. Wood double surfacer, as well as a Gregor-Gourlay gang-rip saw, two Berlin Machine Works Stickers, dowel pin machine and two power feed rip saws for ripping the moulding stock for the stickers.

All the moulding comes uncut from the kiln to the power feed saws. This does away with any additional handling whatever, as the operators take the lumber from the cars as they are wheeled out of the kiln, thus saving a large amount of work every day that would otherwise be necessary. All lumber for the department is sorted under cover or in the mill proper. Lumber coming up for the kilns is loaded direct by off the sleighs or wagons on to the cars or in the dry

Interior of No. 1 Lumber Shed—Estate James Davidson Plant, Ottawa

Corner of Box Shop—Estate James Davidson Plant, Ottawa

kiln, and after drying, these cars are taken on trucks into the mill and to the particular department for which the lumber is intended.

The Door Department

In the door department, as in all other departments, economy in production has been secured. From the drays, the lumber is loaded on to large trucks in the kiln and, after being seasoned, passes through a dry-shed to the main building and to the door department without having been handled again. The lumber is planed by a No. 186 double surfacer made by the Berlin Machine Works, of special design for dressing up door stock. From the door planer the lumber passes through rip-saws, after which it goes to self-operating cut-off saws made by E. B. Hayes of Oshkosh, Wis. All the material is handled from trucks to machine to trucks thus ensuring a minimum of handling. The equipment for manufacturing doors, consists of two complete sets, one of dowel door machinery and the other for all other classes of doors. These machines are so placed that the material passes from one to the other in natural sequence. Thus when the lumber is finished it is handy to the clamping machine.

From the cut-off saws some parts go to the double-end borer, made by the E. B. Hayes Company. The stiles go to the stile borer, where they are bored, and the rails to the rail borer. The latter then go to the automatic glueing and dowel driver where the dowel pins are inserted automatically, and glued. The operation leaves them ready for the door power clamp machine. After clamping, the doors are all handled by a Berlin 48-inch latest type of six drum sander. This machine sands the doors on both sides with one operation which means a great saving in handling. The better class of doors, as odds, go through a single end tenoner, door sticker, chisel mortiser,

Sawmill at Davidson, P. Q.

chain saw mortiser, relisher and door clamp. These, with the exception of some lighter saws, include the equipment of the door department.

The Sash Department

The material for sashes goes through almost the same process as that for doors. The equipment includes single and double end tenoners, chain-saw mortiser, sticker, relisher and boring machine. The machinery in the window and door frame department includes cut-off saws, rip-saws, window pocket machine groovers, beaders, and a large double headed machine for checking the head and jambs of door frames at one operation. Besides these, are a drum and disc sander, combination iron saw tables for mitering, leveling, etc., three buzz planers or jointers and a 30-inch double surfacer, also a number of carpenters' benches for the manufacturing of office and shop fittings, counters, etc. The material of this department is sanded by a Berlin 72-inch three-drum sander.

A cabinet and joinery department has just been completed as an extension to the joinery department, at a cost of $10,000. This building will be used for cutting up various kinds of hardwood, also for storage of kiln-dried hardwood.

The Box Factory

The box factory is a building 100 feet square. The machinery in this department is all of a special nature, the most noticeable of which is a box nailer from the Morgan Machine Company, Rochester and a box nailer from the Doig Est., New York; a machine for driving corrugated fasteners; a Berlin Horizontal re-saw, hopper feed; a Berlin power feed double cut-off saw; a Connelly and Dengler printing press, as well as one from the Morgan Machine Company; two power box board squeezers from the Mereen Johnson Company, of Minneapolis; six sets of rip and cross-cut saws; two Morgan power tongue and groove machines, and a Morgan complete set for making beer and ginger ale cases, of which the firm make great quantities, both nailed and in shook form in carload lots. In connection with this an 8-foot Linderman dovetail machine is used for making ends for boxes.

The Filing Room

The grinding and sharpening equipment is in keeping with the modern ideas followed throughout the entire plant. Besides smaller machines, there are to be found here, a band re-saw grinder, automatic circular grip grinders, a large machine for grinding planer knives and an automatic grinding and setting machine for small band saws used in scroll work. A machine shop has also been added, equipped with two iron working lathes; one large power feed drill; one high-speed shaper and one horizontal planer. Five men are constantly employed and all the repair work of the mill at Davidson is done here.

The Lumber Sheds

The quantity of lumber carried in stock is well over a million feet, all of which is under cover. The sheds occupy the two sides of a rectangle 300 x 400 feet. They are 18 x 20 feet deep and 20 feet high. In the centre is another, 100 x 25 feet, with a plank driveway through the centre, 22 feet wide. One side of this shed has been finished for stock sash and stock doors. The other side is double decked, principally for dressed stock such as mouldings. This shed is one of the best of its class in Canada.

Electricity is used to light the various buildings, lumber sheds, etc., upwards of 500 lights being required for the purpose. Every detail about the whole plant has been worked out so as to secure the maximum of production at the minimum of cost. All the machinery in the entire wood-working factory was installed under the supervision of the superintendent, Mr. Henderson, one of the most competent superintendents in Canada.

Insurance Company Extending its Field

The Toledo Fire and Marine Insurance Company, who claim to be the oldest lumber specializing stock fire insurance company, and who have successfully conducted their business for ten years upon a capital of $10,000, have decided to adapt their company to new conditions by an increase of capital and surplus. The object is to enable the company to take advantage of the opportunities of a broader field than has been open to it under its smaller capitalization. The new stock will be offered to lumbermen and millmen in Canada and the United States. The plan for enlargement contemplates a $500,000 company, with capital of $250,000 and a surplus of $250,000.

The company on entering the Dominion of Canada will make the customary deposit with the Dominion authorities of $50,000. As it is the desire of the directors that the new stock be well distributed throughout the field in which the company will operate, only an amount equivalent to the Canadian deposit will be held open for subscription in Canada.

The opportunity to subscribe to this portion of the new stock is being offered exclusively to Canadian lumbermen who have in past years done business with the company or its underwriting managers, the Lumber Insurers General Agency, through their Canadian office, 42 Central Chambers, Ottawa.

The Berlin Wood-Working Magazine

An attractive and interesting woodworking magazine comes monthly to the writer's attention under the name "Berlin Quality." It is stated to be a Bulletin of Improvements, and fully merits that title, as far as the woodworking industry is concerned.

The most improved ways of doing things about the mill or factory are told in articles by national writers on woodworking topics, mill superintendents, and employees of long experience in their particular field of work. The magazine is, in fact, a regular clearing house for ideas on improved woodworking methods and equipment.

The Berlin Machine Works are constantly improving woodworking machinery efficiency. Several machines that cut manufacturing costs to about one-quarter of what they now are, for certain kinds of work, have recently been designed and are being manufactured by them. One or more such machine achievements of the Berlin Engineers is recorded by picture and description in nearly every issue of the magazine.

The interior views so extensively used in illustrating the magazine, take one mentally into the plants of many of the largest and most progressive woodworking concerns in the world. They show the reader the machines and methods employed therein and how others in his line are solving the problems that confront him.

A small subscription price of 24c a year is charged for "Berlin Quality." This amount merely pays the postage. The publishers feel that they are rewarded for their effort and expense in getting up a helpful magazine for the woodworking trade by the publicity gained for Berlin machines. Subscriptions—either stamps or cash—should be sent to the Publicity Bureau, The Berlin Machine Works, Beloit, Wis.

Paper Making In the Saguenay District

Price Brothers and Company's New Mill at Kenogami, Quebec—Splendid Equipment Installed—Operations to Commence Early This Fall

EARLY this autumn the new pulp and paper mills at Kenogami, now being erected by Price Brothers & Co, Limited, will be in operation, making the second plant in the Saguenay District of the Province of Quebec to transform the log into news print paper. The first plant of the Jonquiere Pulp Company on the same river has been in operation a number of years and for some time back has been controlled and operated by Price Brothers & Company.

Mr. Wm. Price, president of Price Brothers & Company, is well known to every lumberman in Canada. He enters, in this enterprise, a field almost new to him, though he has been connected with the pulp and paper cardboard business for a number of years and the firm's lumbering operations have been as wide as the province.

Mr. Price's right-hand man in the paper end of the business has been Mr. O. A. Porritt, the general manager of the Kenogami Paper Mills, and also vice-president and manager of the Jonquiere Pulp Company. Becoming connected with Mr. Price at Rimouski ten or twelve years ago in the operation of the pulp mill there, Mr. Porritt was later placed in charge at Jonquiere, and the credit for this new development lies largely at his door.

Imbued with a keen appreciation of the great future which the manufacture of news print holds in store for this section of Canada, he threw himself body and soul into the work of building this fine plant, and it stands to-day a monument to his genius for organization and his ability to handle a great undertaking.

Location of Mill and Limits

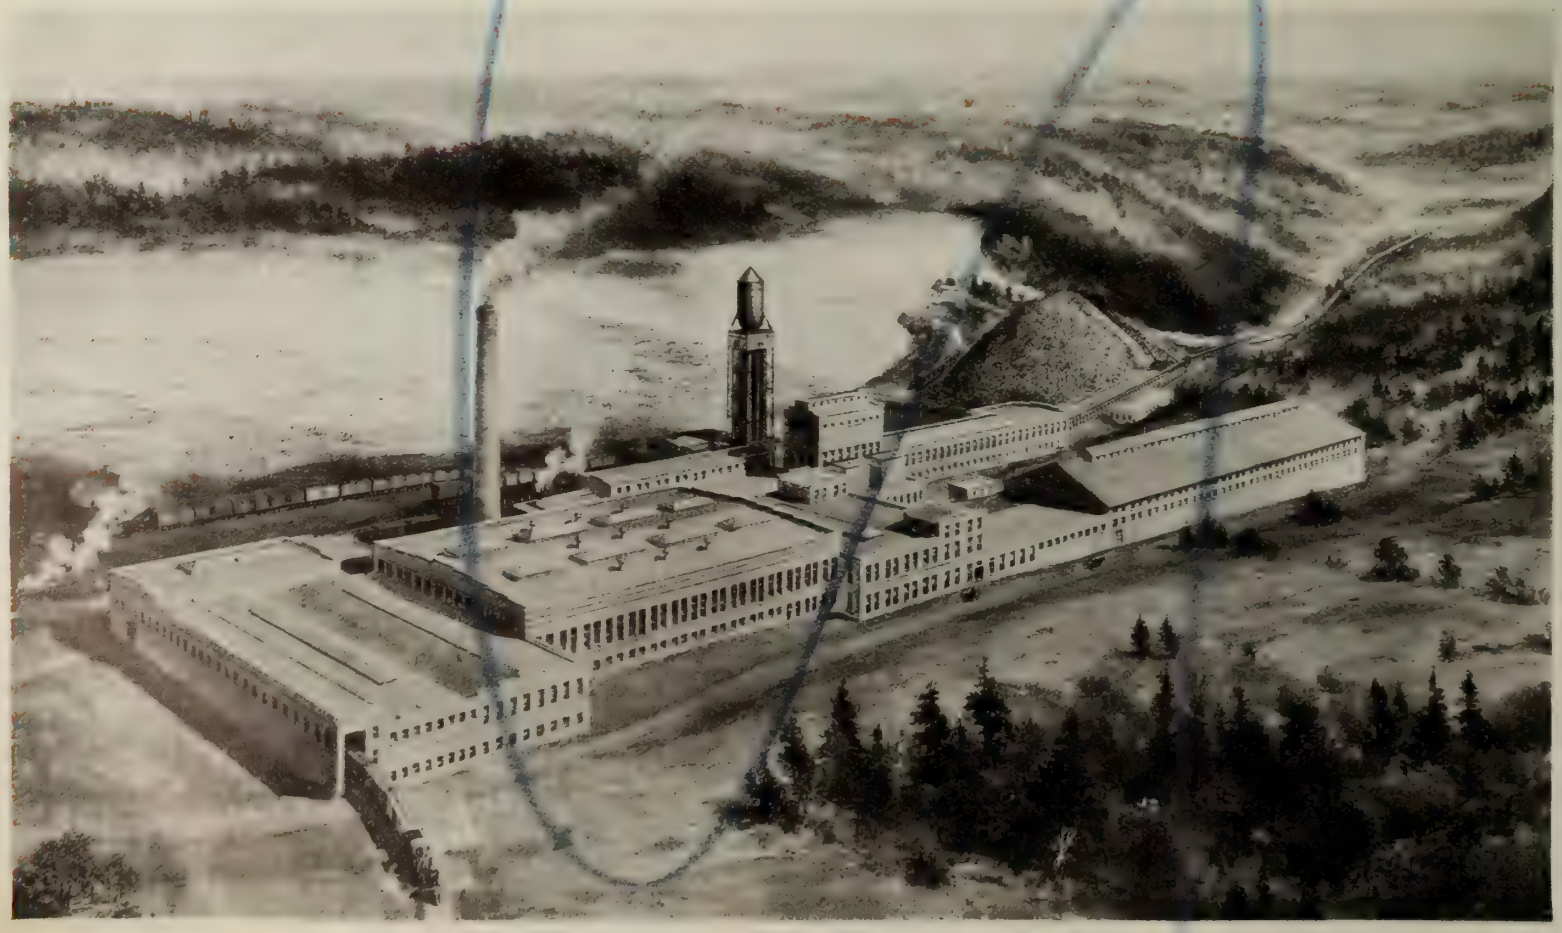
The new mill is situated one and a half miles from Jonquiere, a little above the point where the Riviere aux Sables enters the Saguenay, the site being one of great natural beauty. In the vicinity there has already grown up the thriving little town of Kenogami. This town and the mills are named after Lake Kenogami, which serves not only as a storage reservoir for power, but also, on account of its depth, forms a natural settling basin, ensuring a continuous supply of clean water for use in the actual manufacture of the paper.

Back, or south of the lake, are some of the timber limits owned by the company, which have been cut into in a small way in the last few years, and which provide a portion of the spruce used. Other limits are located on the Belle Riviere and the Metabetchouan, flowing into Lake St. John. The cut on these rivers is boomed at the lake and transported by the Quebec and Lake St. John Railway to the mills. Then, across the Saguenay, a little east of the mill site, is the mighty Shipshaw River and the vast limits of the company tributary to it, some of them not yet explored. In all there are about 4,000 square miles to draw on, giving enough timber to supply the present consumption of 225 cords per day twice over for all time to come. The extent of this territory is so great that the ground is not cut clean, but enough seed trees are left to secure continuous reproduction without resorting to replanting.

It will be readily understood that to cut and drive enough logs to supply a daily consumption of 225 cords involves considerable work and no small capacity for organization. Mr. J. Mc.D. Grosart, who has been in the employ of Price Brothers & Company a great many years, is in charge of this work. Starting with the company as a junior clerk, on his arrival from England, where he was born, he has steadily made his way upward, proving by his ability and capacity for hard work, his fitness to take charge of this immense stretch of limits.

During the season just ended there was cut and driven by the company 30,191,022 ft. board measure of spruce and balsam, all 8½ ft. and 13 ft. logs, averaging 7 inches in diameter. For future years the cut is estimated at a minimum of 45,000,000 feet board measure.

The drive was a particular success this year, taking only about twenty-one days to complete, and was not marred by accident of any kind. The spruce is of a very good quality, free from knots of any kind, which prove so troublesome to the pulp maker, and the percentage of balsam is small. No hemlock was cut, there being none of this wood in the limits. A fire patrol of twenty-five men with telephonic communication has been organized to form the nucleus of a fire fighting force to cover in course of time all the limits, and as a further protection to the company, Lloyds, of London, have written a policy to cover serious fire losses in the woods.



New Pulp and Paper Mill at Kenogami, Quebec—Price Brothers and Company, Limited

William Price, President

The logs cut on the Rivers L'Abbe, Ecorces, Morin and Pikauba are boomed in Lake Kenogami at the mouth of the Pikauba and are rafted across to the Riviere aux Sables and then floated down to the mills. The logs coming in by rail from Lake St. John are skidded from the cars and hauled into the wood preparing room by the same bull chains as the floated logs. Coming up sideways in bunches, they run against the "slashers," which cut them into two feet lengths and drop them on to conveyors, and very quickly now they begin to lose their identity as wood.

Along both sides of the room are the barkers, thirty of them, made by the Waterous Engine Works Company, Brantford, Ont., and run in sets of two by motors. They are fed continuously and conveniently by a system of endless chains. On one side of the room the conveyors for the barked blocks run to the block sluice and on to the grinder room or piling ground as required. On the other side the conveyor is reversible, going sometimes to the sluice and sometimes to the chippers. There are two chippers and crushers combined, made by Baker & Shevlin Company, of Saratoga, N.Y., and these shred up the blocks into small pieces suitable for use in the sulphite mill digesters. The chips are screened in a Ryther & Pringle screen and conveyed by belt to the chip loft in the digester house. This loft is made of concrete and is fireproof, which is something of a novelty in paper mill construction. There are two digesters made by the Portland Company, each approximately 12 feet internal diameter and with a combined capacity of fifty tons a day. The centrifugal pumps are made by the Lawrence Pump Company, and other pumps by Smart Turner & Company, of Hamilton.

The acid tower, as may be seen from the illustration of the plant, is an imposing structure of steel and with the tank on top is 214 feet high. It contains a stairway and an elevator for hoisting the marble and other supplies.

The wet machine room, which contains also the screens for both ground wood and sulphite mills, is most interesting, not so much on account of the machinery installed as for the neat compactness with which the whole is designed. There are 14 centrifugal horizontal screens, Quiller & Stubbs type, built by the Waterous Engine Works Company, twelve of which are placed over the same number of ground wood double wet machines, also built by the Waterous Company. The screened stock is discharged into the wet machines and any overflow goes into a concrete stock tank and is pumped from there to the deckers. The sulphite stock is run through a concrete riffler tank and also a worm knotter and is screened on sixteen flat screens built by the Waterous Company. There are only three single wet machines for sulphite, most of this stock being pumped direct to the sulphite decker chest.

The Grinder Room and Its Equipment

The grinder room is situated at the mouth of the river 3000 feet from the dam and about 300 feet lower than the paper mill.

The penstock was built by the Petroleum Iron Works and is 12 feet inside diameter, 2900 ft. long, made from ½-in. steel boiler plate at headgates, gradually increasing to 15/16 in. at outlet to allow for increased pressure due to the great head of 280 feet. The headgates are operated by electricity.

There are 24 grinders of the International type, built by the Waterous Co., 3 pockets on each, and they take a stone 54 in. in diameter and 28 in. face.

The turbines were built by the Allis-Chalmers-Bullock Co. and are all of the Francis type. Four of them, each developing 4,000 h.p. at full gate, are directly connected to the grinders, one wheel to 6 stones, three on either end. These are designed to run 225 r.p.m. and at full gate the grinding plant will make 168 tons every twenty-four hours.

O. A. Porritt, General Manager

To handle this large amount of material there is a turbine pumping unit, built by Allis-Chalmers-Bullock Co., consisting of a Francis type turbine directly connected to two Worthington type 2 stage 12-in. centrifugal pumps which use 600 h.p. and deliver 4000 U.S. gallons per minute to the wet machine room against a head of 340 ft. The pipe line connecting is 24 in. inside diameter and 3000 ft. long.

One end of the grinder room building is set apart for the hydro-electric development. The equipment consists of two turbines of the same type as the grinder turbines and built by the same firm. These two turbines are fitted with oil governors and directly connected to two Westinghouse generators forming two independent units. The generators are 3 phase, revolving field, and 1875 kw. capacity at full gate. The pressure is 6600 volts which is stepped down in the transformer house to 550 volts for operating the power and lighting circuits in the mill.

The whole electrical lay-out is the most perfect in the world as far as paper mills are concerned, no less than 139 motors being used for various purposes throughout the plant.

The beater room is equipped with 6 beaters, 2 for each paper machine and each pair of beaters is driven by an electric motor with silent chain drive. There are also 2 broke beaters in the basement each chain driven by motor.

There are 3 Jordan engines, one for each paper machine, directly connected to electric motors. All the beaters and Jordans were supplied by E. D. Jones & Sons of Pittsfield, Mass.

There are eight Waterous Ground Wood Deckers put in over a concrete decker chest which is 17 ft. x 70 ft. x 10 ft., and on the sulphite decker chest 30 ft. x 17 ft. x 10 ft., there are three pneumatic thickeners by the Sherbrooke Machinery Company.

The save-all plant is isolated from the mill and contains 6 pneumatics, as well as the water filtering plant. The water is taken from the river and is already so well settled in Lake Kenogami as to require little filtering, but, to make absolutely certain of its cleanness, it is run through wire screens being distributed to the mill by two pumps.

Machine Room Equipment

The three paper machines were built by Chas. Walmsley & Co., Bury, England, and all are 156 in. wide trimming 145 in. of paper.

New Mill Dam, Price Brothers & Co., Limited

Rossing Plant and Wood at L'anse au Cheval, Price Bros & Co.

Log Driving Scene—Price Brothers & Co., Limited

Each machine has three presses, 75 ft. wide and measures 199 ft. 10½ in. from breast roll to reel. The calendars were made by the Farrell Foundry Co. and the Bagley & Sewall Co. built the winders. Each machine is run by its own steam engine and the exhaust steam is used in drying the paper.

The output of finished paper is 150 tons a day and the speed of the machines 600 ft. per minute.

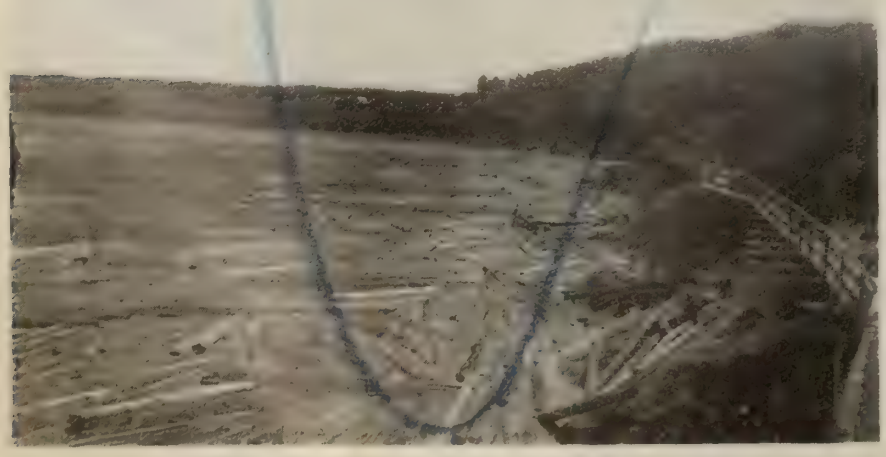
The boiler house contains eight 600 h.p. return tubular boilers by the Robb Engineering Co., which are fed by Murphy Automatic Stokers. The smoke stack is 125 ft. high and there are also 2 fans for induced draft, and one Green Fuel Economizer.

All the buildings housing the plant are of steel and concrete construction, the general contractors being the Canadian Stewart Co. The entire plant was designed by Mr. G. F. Hardy, the well known paper mill engineer of New York City, and his representative on the work was Mr. H. Bennett. Mr. R. S. Kelsch of Montreal was the consulting engineer on the hydraulic and electrical work.

A further hydro-electric development is now being made on the River Shipshaw which will be ready and finished for use on January 1, 1913. The power developed will be 7,500 h.p. on a head of 90 feet. The turbines and generators are made by the Allis-Chalmers-Bullock Co. and the Canadian Westinghouse respectively, and are similar to the one in the grinder room. The transmission line runs to the same transformers and is 2¼ miles long.

This development has been made to allow for an increase in the production of the paper mills, and electrically driven grinders will be installed at Kenogami as occasion calls for them. Until more paper machines are put in, the Shipshaw power will be used in the event of low water in midwinter in the Riviere aux Sables, so that the production of the pulp mill can be maintained at the highest possible level the year round.

Among the recent new advertisers in the Canada Lumberman are Messrs. J. M. Clifford & Company, of Detroit, Mich. This company carries a very large stock of hardwoods, ninety per cent. of their supply being obtained direct from hardwood mills in Kentucky owned by the president and vice-president of the company. They are in a position to make prompt shipments and always have cars on the track to take care of rush orders. They traced a recent shipment from their yard to Toronto, which reached its destination in five days. They claim to have on hand at the present time the largest stock of hardwood ever carried by any firm in the State of Michigan.



Some of the Raw Material Price Brothers & Co., Limited

Canadians Encouraging National Hardwood Association

The decision of the National Hardwood Lumber Association to establish an office in Canada has been so well received that the services of Mr. John Miller, Chief Inspector for Canada, are already in extensive demand. The association is so well pleased with the outlook for the spread of its work in Canada that the secretary-treasurer, Mr. Frank F. Fish, paid a visit of a couple of weeks to Canada during the month of August in order to make further inquiries into the opportunities in this country. He found the hardwood lumbermen sympathetic and enthusiastic and secured a large number of new members for the association.

Mr. Fish was a welcome visitor at the office of the Canada Lumberman and Woodworker. He reports that during July the inspection department of the association inspected 15,909,500 feet of lumber and that July was the banner month in the history of the association as the inspections exceeded the previous high record mark by 763,000 feet.

We take pleasure in publishing for the readers of the Canada Lumberman, portraits of Charles H. Barnaby, the recently elected president of the association, and Mr. Frank F. Fish, its capable and efficient secretary-treasurer.

Mr. John J. Miller, the chief inspector for Canada, will make his headquarters at Toronto.

Mr. Charles H. Barnaby, President of the National Hardwood Lumber Association, whose portrait is published herewith, was born in 1870 in Indiana. He was a son of a well-known Indiana lumberman and went into the sawmill business himself at the age of fifteen. His whole business life has been intimately connected with the

C. H. Barnaby, President N.H.L.A.

F. F. Fish, Sec.-Treas. N.H.L.A.

lumbering business since that time. Indiana is well known throughout the United States as the home of quartered oak and is a historic state so far as hardwoods are concerned, on account of the wonderful quality of its oak. Mr. Barnaby has been on the executive committee of the National Hardwood Lumber Association continuously for the last ten years and is a charter member, having been one of a group of fifty lumbermen who organized the association in 1896. He was elected president on June 7th last at the annual meeting. Mr. Barnaby is an active association worker and was President of the Indiana Hardwood Lumber Association for some years. He also held the office of chairman of the arbitration committee of the National Wholesale Lumber Dealers' Association.

Mr. Frank F. Fish, Secretary-Treasurer of the National Hardwood Lumber Association, was born in Racine, Wis., in 1871. His father, Mr. A. C. Fish, was a member of the Fish Brothers Wagon Company, widely known as extensive purchasers of hardwood lumber. In 1890 Mr. Frank F. Fish began business as the Western representative of the Ealy Mercantile Agency, devoted to the agricultural implement, wagon and carriage industry and similar lines. This brought him into touch with lumber buyers in many parts of the United States. In 1899 he organized the Foster Lumber Mercantile Agency, of which he was president and general manager. This company was continued until 1903, when it was sold to other parties. In June, 1905, Mr. Fish was appointed secretary of the National Hardwood Lumber Association, and three years later the office of treasurer was combined with that of secretary.

The secretary of the National Hardwood Lumber Association, in a letter to the Canada Lumberman, discusses their move into Canada as follows:—

"In placing the licensed and bonded official inspectors at To-

ronto and inviting the co-operation of Canadian hardwood manufacturers and dealers, the National Hardwood Lumber Association offers a practical solution of the problem of a uniform system of grading hardwoods. This association, now in its 16th year, has the support of over 800 members, and the Secretary-Treasurer, Mr. Frank F. Fish, who recently spent two weeks in Toronto, and secured a number of members, is of the opinion that the introduction of the same system and establishing of the same benefits in Canada that are so successful in the United States, will bring the same satisfactory results. Canadian members will be represented on the Board of Directors and also on the Inspection Rules Committee of the association, and in short, will be admitted as full fledged members and participate in all the benefits resulting from sixteen years of persistent effort.

"Ninety-five per cent. of hardwood lumber graded under any official standard is inspected under the rules of the National Hardwood Lumber Association and the inspection bureau officially measured and inspected 15,909,500 feet during July. They now maintain a force of sixty inspectors.

"Mr. Fish states that the association is prepared to engage as many inspector in Canada as may be found necessary to provide prompt and efficient service to its Canadian members and is much pleased at the cordial manner in which the plan has been received.

"A guaranteed inspection should be welcomed by both buyers and sellers throughout Canada. The establishment of this service gives promise of a removal of the chaotic and unsatisfactory conditions that have obtained in the past, due to the absence of an established and uniform system of hardwood inspection.

Lumbering Methods In Quebec Province

Operations of the River Ouelle Pulp and Lumber Company at St. Pacome, Que.—Logging and Manufacturing Processes Adopted

W. Gerard Power, Managing Director

SOME 75 miles east of the city of Quebec on the southern shore of the St. Lawrence River a traveller on the Intercolonial Railway will come to the picturesque village of St. Pacome, one of those delightful French-Canadian settlements where the habitant and the lumberjack have been living peacefully for generations past and where one finds much of the atmosphere of the old regime still preserved by the descendants of the early settlers. The River Ouelle flows through the Village of St. Pacome on its way to the St. Lawrence, and during the summer time are borne upon its stream vast quantities of spruce and cedar logs which have been cut in the timber limits further up the river, by the River Ouelle Pulp & Lumber Company.

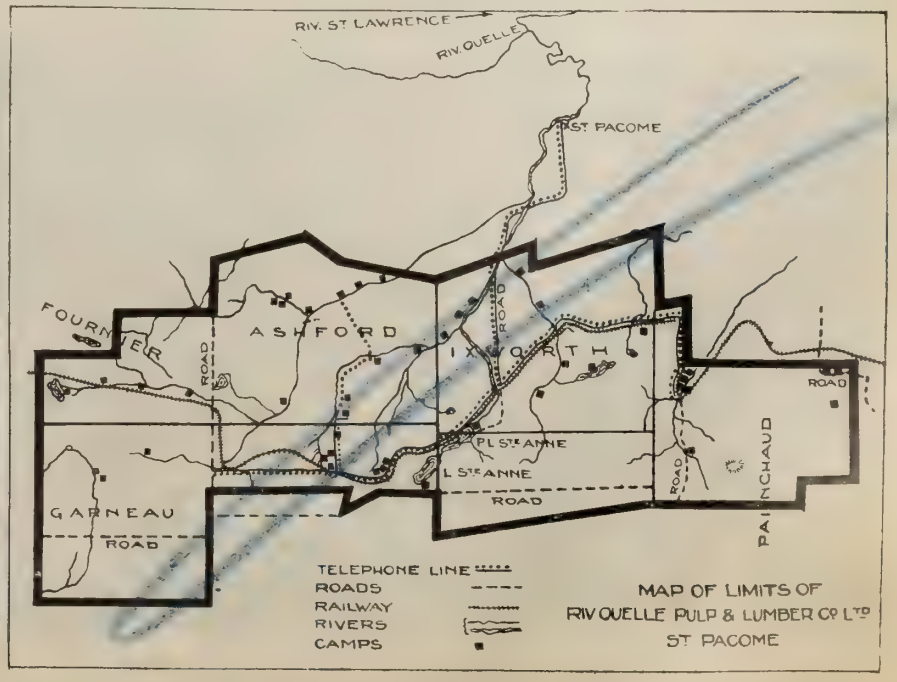
The Offices and principal mills of the River Ouelle Pulp & Lumber Company are located at St. Pacome. Sawmilling at this point commenced about one hundred years ago, although operations were only commenced upon an extensive scale about fifty years ago, by a Mr. MacDonald, who drove his logs upon the River Ouelle and stocked them for a brief time, after which he sold out to Mr. Charles King. Mr. King erected a water mill with an upright slabber and straight line gang. In those days nothing but pine was cut. A day's operations, involving the work of four shifts, which lasted for six hours each, resulted in the cutting of about 30,000 feet. Mr. King subsequently formed the company known as King Bros., which was followed some time afterwards by King Bros. Limited. The firm continued operating until 1903, when the River Ouelle Company bought them out. King Bros., Limited, operated two mills; the one referred to above and a second which they erected later. The latter mill was a circular with an edger and trimmer. The River Ouelle Pulp & Lumber Company, when they came into possession of the mills, worked them for one year, and in 1904 erected the present mill, which is shown in one of the accompanying illustrations.

The chief mill of the River Ouelle Pulp & Lumber Company, located at St. Pacome, is equipped with a complete outfit of sawmill machinery furnished by the Waterous Engine Works Co., of Brantford, Canada. The outfit consists of a double cutting band mill, a live gang, trimmers, edgers, and a lath mill and boiler combined, also four machines for barking pulpwood. The annual output of the mill consists of about 12,000,000 feet of spruce lumber, 3,000,000 lath and 5,000 cords of rossed pulpwood. A large portion of the product in lumber and lath finds a market in New York and the New England States. All the pulpwood is sold in New York.

Urbain Bard, Grand Foreman

The live gang referred to above is a most interesting machine. It takes a log without any slabbing, having a planer head attachment for making a flat surface on the under side of the log by means of which it is steadied in passing through the gang saws. This makes it possible to operate the gang upon live logs. The gang carries saws 26-in. long, 7-in. wide and 14 gauge. Usually it is equipped with from

St. Pacome Mill of River Ouelle Pulp & Lumber Co., Limited



Double Cutting Band—River Ouelle Pulp & Lumber Co.

Interior View—River Ouelle Pulp & Lumber Co.

eight to ten saws and it will take logs up to about 11-in. at the butt end. The double cutting band saw is 43 feet 8 inches long and 11 inches wide. The mill is equipped with gunshot steam feed carriage.

The company operate the band mill night and day and it turns out from 85,000 to 90,000 feet daily. The gang saw is only operated in the day time and produces about 20,000 feet of lumber. The barkers take care of from 25 to 30 cords of pulpwood per day. The lumber output of the mill is entirely in 1-in., 1½-in. and 1¾-in. stock, principally 13 feet long and from 4 to 10 in. in width. These are the sizes that are especially wanted in the markets of the Eastern States. The mill at St. Pacome furnishes employment for about eighty men. Another twenty men are employed in sorting, piling, etc., while ten men more are engaged in shipping, and altogether there are from 120 to 130 men employed in the mill and yards. The company attend only to the sawing, edging and trimming of the lumber. After the product passes the trimmer saws the work is all done by contract.

The River Ouelle Pulp & Lumber Company have excellent yarding capacity for their lumber. The average haul to the yard is 1,600 feet from the mill. This involves additional expense for hauling, but makes the property particularly attractive from the insurance point of view. Special attention was paid by the company in erecting the mill to having it conform as closely as possible to the underwriters' specifications, patent fire extinguishers, hose and barrels being installed on each floor.

The Pulp Wood Operations

The handling of pulpwood logs is a distinct feature of the operations. A separate jack ladder is provided for taking the pulpwood logs into the mill. They are then cut into 2-ft. lengths, barked by the rossing machines and carried outside by an overhead conveyor, which has a storage capacity of from 2,500 to 3,000 cords. Another conveyor is used for hauling the 4-ft. peeled wood. This is furnished by the farmers who do the peeling themselves during the months of May, June, July and August. This class of pulpwood is purchased from the farmers at a fixed price per cord on the bank of the river.

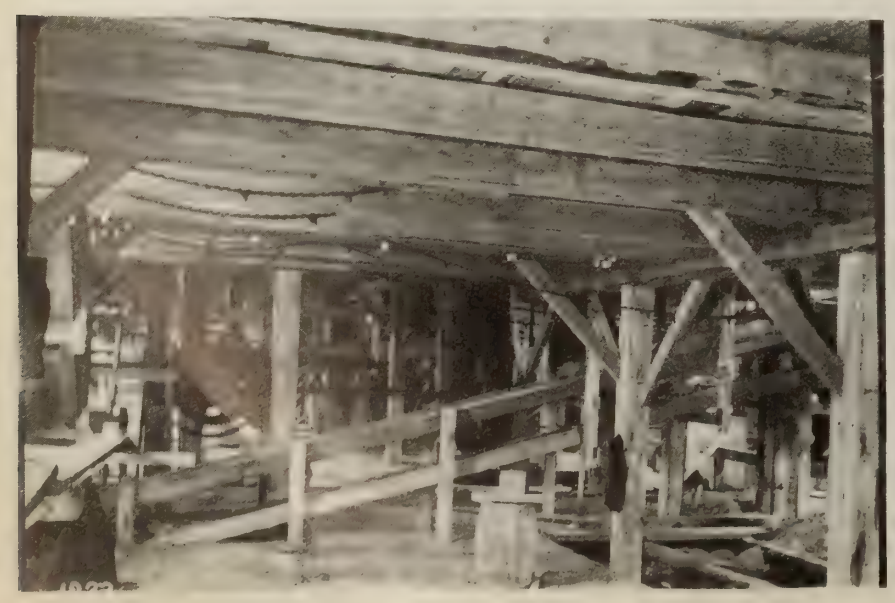
In addition to the mill above described the company found it necessary to erect a second mill to cut the logs coming from a certain section of their limits which are located on the headwaters of the River Du Loup, the logs from which cannot be driven to the main mill at St. Pacome. This mill is equipped with a circular saw and has a capacity of from 35,000 to 40,000 feet per day. It is located at Powerville, quite close to the line of the new National Transcontinental Railway.

The company also have a mill with a capacity of 25,000 feet per day located upon the waters of the River Du Loup in the first range of the Township of Painchaud. These two mills on the River Du Loup are operated only in the winter time. When the Transcontinental Railway is completed they will be operated all the year round and shipments will be made via this railway. At present the lumber is hauled a distance of 12 to 16 miles to two points on the Intercolonial Railway.

The company will construct another mill on the River Du Loup as soon as the National Transcontinental Railway is completed, and still another mill will be constructed at the discharge of Lake St. Anne. This mill will operate upon timber secured from some of the company's Crown land limits. The company will then have five mills operating in various parts of their limits.

Logging Methods and Conditions

Most of the logs upon which the River Ouelle Pulp & Lumber Company's mill at St. Pacome operate are taken out by contract. The company only operate one camp themselves. The logging operations as a rule commence during the month of October and are completed about March 20th. The timber upon their limits is excellently situated from the logging point of view. The average haul is only about one mile and the drives vary from 25 to 55 miles. Most of the streams are very rapid and the company have erected 12 dams on them as well as a large reservoir dam on the discharge of the smaller Lake St. Anne. These improvements have greatly facilitated the driving of the various streams. Upon the River Ouelle there are a number of falls, one of which is forty feet high and another fifteen feet high. One section of the river, known as the "Gorge," has five falls, with a total drop of 50 feet. At the foot of each of the falls the



A Spacious Ground Floor—River Ouelle Plant

A Few of the Logs—River Ouelle Pulp & Lumber Co.

company have cleaned out the rocks so as to prevent the logs from being broken up.

On account of the swiftness of the waters the logs are sometimes piled up in large jams reaching as high as 10 or 15 feet above the level of the water and extending a long distance up the river. At the foot of these jams the logs have to be worked off one by one and floated off down to the log pond.

An instance of the difficulties which are sometimes met with on account of these large jams is afforded by an incident which occurred during the year 1903 at a place known as College Falls. In the spring of that year a jam occurred above the falls which contained over 100,000 logs. The river was fairly low at the time and all the logs below the falls were cleared. The men then set to work upon the brow of the falls, across which the logs were jammed. They operated with a hand dog, consisting of two ropes with a dog and ring. By this means they hoped to loosen the logs at the brow of the hill and start the great jam moving. It was necessary for one of the men to undertake the dangerous task of fastening the dog upon what was considered to be the key log. This was located about the centre of the brow of the falls and while the man was at work the great mass commenced to move and thundered over the falls, the man disappearing beneath. Everyone in the crew imagined that their companion would be ground to pieces immediately, but through some miraculous interference he was sheltered from fatal injury by the logs forming an arch above him.

Four of the members of the crew secured a boat at the bottom of the falls and rowed out into the whirlpool to the base of the new

Pulpwood and Conveyor—River Ouelle Pulp & Lumber Co.

jam which had formed by the logs coming over the falls. They took their lives in their hands, for at any moment the rest of the 100,000 logs above the falls might be expected to follow and carry death to all in their path. Lumberjacks, however, are accustomed to danger of this sort and it was only a short time before the four men in the boat discovered the hand of their companion sticking out from between the logs. They found that he was alive and comparatively uninjured and they set to work to extricate him. This, too, was an extremely dangerous business. With the skill which is innate among lumberjacks, they pried and pulled at the logs until they had secured sufficient space to permit of his head and arm being drawn through. Then it was a case of practically pulling him to safety by sheer force, running the double risk of loosening the logs and also of injuring the imprisoned man by the severity of the strain. To make a long story short, they finally succeeded in extricating their companion and bringing him safely to shore, after which, nothing daunted, they renewed the task of loosening the jam at which they were finally successful.

Telephones Used for Logging

One of the most interesting features in connection with the River Ouelle Pulp & Lumber Company's operations is the fact that they have established throughout their limits a telephone system by means of which they can communicate with men in various parts of the limits. The company now have a total of seventy odd miles of telephone line, of which they constructed fifty at first, suspending the line upon the trunks of trees. The last twenty miles have been constructed upon what is known as the trolley system, that is to say, the line is suspended from trees on either side, so that if any of the trees should fall, it will drop to the ground instead of being broken. By means of its telephone system the company is able to communicate with men at work upon the rivers and can therefore regulate the hours of opening and closing the dams and give instructions to the foreman on the drive, without wasting the time which was formerly necessary to cover the distance by a messenger. One of the most important uses of the telephone line, however, is in connection with the prevention of forest fires. By its means it is possible to report fires during their early stages and a force of men can be despatched immediately to the scene. It seldom happens that a blaze secures sufficient foothold to make it at all dangerous.

Some Interesting Cost Data

The River Ouelle Pulp & Paper Company devote a great deal of attention to systematic preparation of cost accounts in connection with all their operations. An interesting example of the valuable information thus tabulated is afforded by the following table, showing the cost of feeding men and horses in one of the company's camps, at which about fifty men were employed.

	Cost per meal per man	Per day	Per mon.	Per meal per horse	Per day	Per mon
	$	$	$	$	$	$
1908-09	0.1075	0.322	9.66	0.1984	0.595	17.85
1909-10	0.1083	0.3249	9.74	0.2162	0.648	19.45
1910-11	0.1084	0.325	9.75	0.16	0.48	14.40

(During 1908-9 and 1909-10 the barn boss's wages are included in the above table of the cost per horse).

The cost of food for men in the above table includes the cook's wages and the wages of chore boy.

In addition to the above costs the company charge each camp $9 per month per horse by way of rental for their services.

Another interesting table shows the average wage, together with the cost of board per man at the above camp. These are as follows:

	Average wage per day	With board	Wage per month	With board
	$	$	$	$
1909-10	.8840	1.2089	22.984	32.72
1910-11	.9186	1.243	23.883	33.633

The cost of boarding the men when worked out and apportioned to each 1,000 feet of lumber according to log measure during 1909 and 1910 was $1.113 and during 1910-11 it was $1.26. Similarly the cost of the horses when apportioned against 1,000 feet of lumber by log measure was during 1909-10 .742c and during 1910-11 .512c.

The cost of the logs per M. log feet on the yards during 1909-10 was $3.28 and the hauling cost was $2.139, making a total operating cost of $5.42. During 1910-11 the cost on the yards was $2.93 per M. log feet and the hauling cost $1.603, making a total cost of $4.53 per M. log feet. These figures do not include stumpage.

The directors of the River Ouelle Pulp & Lumber Company include Hon. John Sharples, Quebec, P.Q., president; William Power, M.P., Quebec, P.Q., vice-president; R. Harcourt Smith, Quebec, P.Q., treasurer, and W. Gerard Power, St. Pacome, P.Q., managing director.

Urbain Bard—Grand Foreman

Urbain Bard, the Grand Foremen of the River Ouelle Pulp and Lumber Company, whose portrait is published at the head of this article, is a man who knows his work from the ground up. He was born at St. Pacome, Que., about 59 years ago. One might mistake him for a natural born French Canadian, so fluently does he speak the French language, but he comes of English stock. His great grandfather came to Canada from England, in the person of one John Barr, which name, taking a French pronounciation, was finally spelled as it was pronounced, and the final "r" was changed to a "d."

Urbain Bard, during the earlier days of his career, worked for a short time in the vicinity of Lake Champlain, afterwards returning to Quebec when the white pine lumber business was booming there, and worked for several seasons on the wharves at Point a Pizeau, as a deal-carrier.

Born on the outskirts of the spruce forest, the hustle and bustle of a thickly populated centre had no attraction for him, and he returned to the old homestead. Shortly afterwards he accepted a position as foreman in the lumber camps of Messrs. King Bros., at Grand Pabos, Gaspe Co., which position he held until the River Ouelle Pulp & Lumber Company bought the River Ouelle limit from Messrs. King Bros., twenty years later, when he returned to his native parish, and accepted a position as superintendent of lumbering operations, which position he still holds.

It will be seen from this brief sketch of his career that Urbain Bard was practically born and brought up in the woods, and is as much at home in the heart of the forest as the deer.

Hardware jobbers through eastern and central Canada are sending to their trade a little folder illustrating and describing Simonds Crescent Ground Cross-Cut Saws. Special attention is called to the mechanical advantages of using the Crescent Ground Saw and to the saving in time and labor which the use of this saw gives. There is also a suggestion regarding Simonds Hand Saws and the Simonds Special Cross-Cut Saw File. This file is one which has been developed for the particular purpose of filing cross-cut saws. The folders are issued by the Simonds Canada Saw Company, Limited, of Montreal and St. John.

Barker at Work on Fir Log

Typical Small B. C. Logging Operation

Description of the Methods Employed in Taking Out Logs in a Camp of Twenty Men—Costs of the Work

By G. H. Prince

Logging operations in British Columbia are a very different proposition from those in eastern Canada. The great size of many of the trees, the different climatic conditions and the employment of Hindu, Chinese and Japanese laborers all combine to make the logging business an entirely new experience for anyone who enters it after being accustomed to the conditions in other parts of Canada. Readers of the Canada Lumberman are already fairly familiar with the principal points of difference, but will be interested nevertheless in the following description which was written by Mr. G. H. Prince, a member of the class of 1912 in the New Brunswick school of forestry. Mr. Prince had the good fortune to visit and study the operations of the Timberland Lumber Co., Ltd., whose head office is at New Westminster, B.C. The site of the logging operations, which he describes, was at Craig's siding, about twelve miles from Vancouver on the line of the British Columbia Electric Railway to Chilliwack. The land which was being operated was fairly level and not more than one hundred feet above the sea. In spots it was very swampy, the water was boggy and highly colored and quite unfit for drinking, although suitable for using in the engines. The Timberland Lumber Co. was under contract with the British Columbia Electric Railway Co. to clear entirely, for a distance of two hundred feet on each side of the track, several miles of railway. The object of the clearing was to prevent wind-falls from breaking the wires as these breaks were very costly to the company, the loss often amounting to $1,000 in time for repairs, burnt out fuses, etc.

This section of the country had never been logged over before, but forest fires had swept over it about one hundred and sixty years ago, remains of the old stumps and scars on some of the oldest trees bearing unquestionable evidence of this fact. The average age of the trees upon these limits was from one hundred and fifty to one hundred and sixty years. About 70 per cent. of the timber was red fir; 10 per cent. Western red cedar; 10 per cent. Sitka spruce; 5 per cent. western white pine and 5 per cent. western hemlock. The average production of the land was about 45,000 feet b.m. per acre, and the trees averaged up to 60 in. in diameter, breast high, and contained an average of two hundred feet of merchantable length. The fire protection upon the property was attended to by the Dominion Government fire ranger, who visited the region and traversed its length once a week. In case of fire he was empowered to employ the necessary number of men to extinguish the flames.

The nature of the stand of timber was such that nearly all of the trees were larger and suitable for saw timber and for ties. The

Butt of Red Fir, Dressing 5,080 Feet B. M,

Same Log Being Cut in Mill

greater part of the timber was sound and straight with a very small amount of taper. Resin pockets and a few heart shakes and ring shakes were occasionally noticed, but in general the timber was not over-mature. The length of the unmerchantable top varied from fifty to one hundred feet and in some cases the presence of large limbs rendered tops of 15 in. diameter unfit for saw timber.

The climatic conditions were such that the best time for logging was in the summer, during the dry season. Winter operations differ very slightly from those of the summer in that part of Canada, there being hardly an inch of snow during the winter months. For this reason logging operations in the winter are far more uncomfortable and are more frequently interrupted by the long continued rains. Upon occasions the work might be held up in this manner for a period of two weeks. The level nature of the ground, the short haul and the medium size of the timber made it possible to use horses instead of the more common donkey engine and cable system. The donkey engine and cable however are used all over the mountain region of British Columbia with great success. In a few cases railway logging has taken its place.

The bringing in of supplies to the camp was simplified by the presence of the British Columbia Electric Railway, freight being delivered regularly at the company's siding. Lumber from the company's mill was shipped by rail to Vancouver whence it was forwarded by rail to eastern Canada or exported by vessel.

The labor situation was more satisfactory than in many other parts of Canada, as labor was easily secured. Men are in the habit of changing from camp to camp every day and the vast numbers

Making Skidroad with Yarding Team

Yarding Team at Work on Sitka Spruce

of incoming laborers from foreign lands make it a simple matter to fill their places. Unskilled labor is entirely changed about every two months or oftener and consists largely of Hindus. Chinese laborers are also employed and are much steadier, being inclined to remain longer than the Hindus at one situation. In some cases, Chinamen showed remarkable ability and advanced to the important position of head filer, requiring exceptional skill and good judgment, which can only be secured by long experience. The majority of the Chinamen however, are employed as cooks. The Japanese are found to be a fairly steady class of laborers and are frequently employed around the machinery, being more careful than Chinamen or Hindus. The logging crew was composed largely of Swedes who, as a rule are men of large physique and excellent endurance, being therefore peculiarly fitted for this class of work. The logging crews also included a large percentage of Canadians, but there were very few Englishmen to be found in employment of this nature.

The two camps consisted of dining hall, bunk house, office, several smaller houses used by the men for their families, also a small portable mill capable of cutting 35,000 feet per day, were built about one mile apart. This permitted the operations to be carried on at a distance of half a mile on each side of the camp. Each mill was supposed to finish its area in less than two years.

The Falling Operations

Cutting operations are started by the head faller, who with his assistant, under-cuts the trees on the side towards which they are desired to fall. The cut is made about six feet from the ground in order to escape the butt swell and its usual extra quantity of pitch, and also to render accurate falling possible or to simplify it. The trees are cut with a saw about fourteen feet long, the men standing on spring boards, made of some hard strong wood. These boards are about six feet long, one inch thick and six inches wide. At one end is attached a horse-shoe-shaped iron with the toe calk extending upwards somewhat like a hook. A V-shaped notch is cut into the tree at the correct distance from the ground and the board inserted with the hook on the upper side. The weight of the man keeps the board in place. The calk is circular in shape, allowing the board to be swung so that the chopper may cut the tree on either side.

The head faller decides the direction in which the tree is to fall and he and his assistant undercut it in that direction. The undercut is usually made about one foot deep, then the swing boards are swung around and the tree sawed down from the opposite side. Whenever the saw binds, wedges are driven into the saw-cut behind the saw, which serve also the purpose of starting the tree to fall in the right direction. After completing the falling of a tree the two fallers move along to the next tree which has been selected. They can in one day cut from ten to twelve trees of an average diameter of fifty inches.

After the Fall of the Tree

When the tree has been laid low, the barker commences his work, which consists of cutting off the limbs from all of the trunk which he thinks is merchantable. Following the barker, come two buckers whose business is to cut the tree into logs. This operation is performed with a one-handled cross-cut saw, the men working separately. To some lumbermen this proceeding would seem rather unwise, but it is the only method available in timber of this nature, as the trees are of such a size and fall so frequently in such a position, that cross-cutting by two men is impossible. A good position for one sawyer might be found on one side of the tree, while on the other side there might be a drop of ten feet.

When the cross-cutting has been completed the sniper takes charge. He sights along the log, notes its curve and the amount its pith is out of centre. Thus he is enabled to learn the position in which the log will rest when it is being hauled. From what will be the bottom side of the log, he removes the bark with an axe, then he snipes all the forward end of the logging; that is to say, cuts off the lower corner so as to give the log a curve somewhat similar to the end curve of the sled runner. This permits the log to glide readily over the skidways. Skidways are laid out by the head skidway man and built by him with the help of two assistants. The place for the road is levelled up with pick and shovel. Cross logs or skids are laid at intervals of five feet and the skids themselves are from twelve to fifteen inches in diameter and about eight feet long. They are sunk into the ground so that only the upper half appears. From the top of the skid the bark is removed so that the smooth side of the log will glide easily over it. Two men are employed as "greasers," who carry cans of crude oil and apply it with a dauber to the top of each skid before the passage of each load of logs. In swampy places, it is necessary to cover the space between the skids with sawn cedar planks so as to prevent the horses from sinking in the mire. Over every gully, hole or creek bottom, heavy bridges are erected to reduce the grade of the skid road. The preparation of these skid roads is carried out before any falling is done.

As soon as the sniper has finished his work, the two swampers cut up the limbs and clear them out of the road. Then comes the driver with his four horse loading team and at the same time the hooktender and two rigging slingers appear upon the scene. The

rigging consists of four or five wire ropes one inch in diameter and 30 feet long, having a hook in one end of a loop in the other end, one double turn and one single turn pulley, also several short pieces of wire cable. The cable is used to attach the pulleys to the stumps and to the logs. After the rigging has been arranged and properly attached, the yarding timber is hooked to the loose end of the cable and the log is thus pulled on to the skidway. The yarding team takes it forward to a suitable place at which it is taken up by the six-horse yarding team. The former team returns and pulls up another log which is attached to the rear end of the first log by a 4-foot chain and two dogs. In this way four or more logs are attached. Sometimes as many as six or seven logs are strung together in this manner to form what is known as a "turn" and are hauled to the mill by the six-horse, skid-road team. This team makes about ten trips a day to the mill which is less than half a mile away. On the return trip, the dogs, chains, grease cans, etc., are placed on the long narrow sled and hauled back by the team. The logs are cut in various lengths ranging from sixteen to forty feet and one "turn" will often contain in excess of 4,000 feet b.m.

Costs of the Operation

In connection with the operations above described, the company employed the following men, at the wages shown in the list:

1	Head faller	$5.25 per day
2	Second faller	$4.75 " "
1	Barker	$3.75 " "
1	Sniper	$3.75 " "
2	Swampers	$3.25 " "
1	Hook tender	$4.75 " "
.2	Rigging slingers	$3.25 " "
2	Greasers	$1.61 " "
2	Drivers	$3.04 " "
1	Woods foreman	$3.84 " "
1	Head skidway man	$4.00 " "
2	Skid road man	$3.00 " "
2	Buckers	$3.50 " "
10	Horses, shoes and feed, each	.33

This makes a total of 19 men and 10 horses at a total cost of $68.69 per day. The cost of each 1000 feet delivered to the mill was $1.96 in wages. The average cut per day was 35,000 feet. After the cutting the condition of the land was that of a complete clearing, with the brush scattered about.

The Passing of a Great Lumberman

Otis Staples, Wycliffe, B. C.

To lumbermen in many parts of Canada, the news of the tragic death of Mr. Otis Staples, one of the best known lumbermen of the East Kootenay district of British Columbia, came with apalling suddenness on August 9th. Less than a week previous to that date, Mr. Staples had set out, in the best of health, upon a fishing trip on St. Marys Lake. While casting with a fly, during a heavy wind, Mr. Staples unfortunately got the hook of one of his flies driven through the corner of one eye, whence the point and barb curved around and protruded through the pupil. In spite of the severe pain which he was suffering, Mr. Staples directed his boat man down the lake and drove his motor back to his home at Wycliffe, a distance of twenty miles. He was immediately given medical attention and taken to Spokane, Wash., for treatment by eminent ocular surgeons. From the very first it was seen that his eye could not be saved and it was also realized that far more serious danger was involved. In the end, meningitis developed and Mr. Staples passed away at 10 p.m. on Friday, August 9th.

By the death of Mr. Staples, the lumber industry in Canada has lost one of its most prominent members and a man whose example was an inspiration to all who knew him. Mr. Staples was born at Douglas Parish, York County, N.B., on October 27th, 1847. In 1869 he emigrated to the United States and settled in Stillwater, Minnesota, where he resided until eight years ago, when he moved to British Columbia and promoted the company which bears his name. In Stillwater, his activities were largely in the pine forests of St. Croix River. His skill and his indomitable spirit at once made him a leader among his associates. For years he operated on the St. Croix River, until the fast disappearing forests admonished him that he must seek other fields for his endeavors. He associated with several parties in Stillwater and became largely interested in the Johnson, Wentworth Company. He was a stockholder and director of the Northwest Thresher Company, a stockholder in the First National Bank of Stillwater, and had other and various interests in and near the city on the St. Croix at the time of his removal to Canada. How successful his work has been in East Kootenay is attested by the magnificent property he has there built, developed and maintained, where a few years ago was but a wilderness to-day is a thriving community. Comfortable homes, and broad acres covered with produce of the farm stretch away beyond the vision where recently was a barren waste. And all this was done in a few short years. But time was precious to him and he made the most of every moment of his active career.

Of the man himself, his character, his indomitable energy, his brave heart and his unfailing charity, much might be said. Firm and resolute, uncompromisingly honest in his dealings with his fellow men, he had a determination to accomplish, a skill that never failed him. He succeeded where more timid men fell by the wayside. Mr. Staples had unbounded faith in human nature; he loved his fellow men, and he loved to do all he could for them.

Preservation of Forest Wealth

By Wynyard C. Gladwin

The forest fire prevention clauses, of the new Forest Act, placed on the statutes at the last session of the Provincial Legislature, are of the greatest importance to the general welfare of the forest and wooded tracts of the province. They provide a solution for doing away with the several points that constitute the danger, offering a remedy which, when applied by a proper system, cannot but result in a successful conclusion.

First comes the composition of the staff under the Minister of Lands, which carries into effect the meaning of the act. At the head of the different branches of the Forest Branch is a chief forester with an assistant who has the supervision of the field operations, with the fire patrol force directly under his supervision. The province is divided into sections in charge of supervisors, the section divided into divisions, which are again divided into districts, the division being in charge of divisional men and the districts patrolled by dstrict men.

One of the most important provisions of the act is contained in the clause which provides for the disposal of debris left from logging operations, or along the right-of-way, pole lines, and around mines, camps, mills, etc. Such debris can, by section 123 of the act, be declared a public nuisance by the Minister or Forest Board and must be disposed of by persons or companies creating it.

Second.—Railways must patrol their right-of-way in a satisfactory manner, to prevent the spread of fire that might be caused by their locomotives and must keep the right-of-way clear of inflammable matter.

Third.—Settlers clearing land must obtain a permit to start a fire between the 1st of May and the first day of October of each year, and are responsible for preventing the fire from spreading off their premises.

Fourth.—Male persons between the ages of 18 and 60, excepting trainmen, telegraphers and dispatchers on duty, doctors and persons physically unfit, can be called on to help extinguish a fire by any official appointed by the Lieutenant-Governor-in-Council to enforce the act. The penalty for violation of act is not less than $50 and not more than $300, in addition to costs.

As the province becomes settled and its industries increase in number, the danger from fires are becoming more and more pronounced. The province possesses a stand of timber magnificent in its quantity and quality, supplying work directly to from twenty to twenty-five thousand men, and bringing into the province twenty-five millions of dollars annually from the production of lumber, and adding to the revenues of the government two million six hundred thousand dollars from royalties and rentals. With these facts before us we can say that the best laws and regulations that can possibly be conceived, and the best system and organization that can be provided, is none too good.

Many destructive fires in the past have been caused by extreme carelessness on the part of the operator in not providing proper equipment and safeguards, or watchmen, to prevent a fire from starting and getting beyond control. By neglecting these precautions parties thought they were saving a few dollars but in the end risked being ruined by the loss, and causing large timber areas to be destroyed. Settlers in a deliberate manner, for the sake of clearing a little patch of land, would allow their fires to spread to the adjoining timber and think nothing of the loss which followed. Railway companies cared nothing about their locomotives scattering fire broadcast and destroying thousands of acres of wooded lands on the mountain side. Campers in the woods and prospectors after mineral did not appreciate the greatest of all crops that the earth can yield —the forest—and destruction too often marked their wandering trails.

Well it is for the nation at large that a new era has dawned for the preservation and conservation of the great public asset. May the people soon become guardians as well as the officials who may be designated by the government to carry out the laws in this respect.

The Prairie Lumber Trade During 1912

Great Alterations which Have Taken Place During the Present Year —The Manufacturing Retailer—Rapid Growth of Retail Trade

The lumber industry of western Canada is one of rapid changes, of new conditions and of an ever widening field. The arising, year by year, of new conditions make necessary the putting into effect of new provisions to cope with them. It seems remarkable to reflect to-day that the lumber business of western Canada was merely a matter of local interest twenty-five years ago, and that the great fabric of the retail business of the prairie provinces has been entirely built up during that period.

Rapid as the changes have been during the past quarter of a century, there is every indication that these changes and events will fade into insignificance when compared with those which will materialize during the next period of the same length.

Even the past year has seen many events of an important bearing develop in the lumber business of the west. One of the most important of these has been the determined fight for and against the tariff restriction on lumber imported from the United States. There is no question but that the situation thus far has developed entirely as the greater restrictions on the import of lumber and the scope given the importers of these lines, has grown also. Should the Supreme Court uphold the decision of the Exchequer Court, making lumber dressed on one side and jointed on the edge dutiable, the situation will be a most interesting one. It would seem as if it would be quite possible to interpret such a finding to the end that all lumber must pay duty except that which is rough or rough and surfaced on one side only. Needless to say, it will not absolutely stop the importation of lumber from the United States mills, but it will prove a great obstacle in the way of carrying on the traffic, and will prevent much business which now is being freely carried on.

Importance of the Grain Carrying Facilities

One of the great elements in the future of the lumber trade of the prairies is the provision of more and greater facilities for the carrying of the grain. Two of the greatest elements in this situation are the Panama Canal and the Hudsons Bay Railroad. The eastern mind cannot readily grasp the importance of the conditions connected with the crop situation to the lumber business and those connected with it. A heavy and good crop and a successful harvest is the keynote of the prosperity of the lumber dealer. With a good crop harvested and turned into money, the prairie farmers are able to pay their bills, the retail dealer is able to square up his accounts and to square himself with the wholesale dealer, who in turn settles his account with the mills. The interest of the whole lumber trade in the crop situation may thus be readily gauged and understood.

One of the best illustrations of this condition was the car shortage of the fall of 1911. The crops on this occasion owing to frequent and continued rains, were about three weeks later than usual. When harvesting was over, the grain was poured into the railroads in such tremendous quantities and with such great suddenness that it could not be handled and immense quantities were left in the stook and in the elevators throughout the winter. The farmers were unable to settle their accounts. The retail dealers were in a similar position and the whole lumber business suffered from this cause for six long months. Practically all the retail dealers were obliged to adopt the policy of greatly curtailing their credits and restricting sales to the best accounts or to those who had the cash. The effect of this has not entirely passed away in the country districts, nor will it do so until the present harvest is assured, or reasonably so. The importance of the crops and the returns therefrom to the lumber dealer of the prairies, and to the mills (whom he in reality represents) may be judged from these circumstances.

The Panama Canal and Its Effect

That the lumbermen of the prairies will be deeply interested in the facilities for moving the crops follows as naturally as night follows day. As has been already stated, the facilities for transportation already planned will make a vast difference in all lines of business on the prairies, and particularly to the lumbermen. The Panama Canal will go far towards relieving the annual congestion of grain. It is claimed that most of Alberta's grain output will be shipped via Panama and in case of a car shortage Saskatchewan's crops may be sent to the market through the same channel. Another effect of the Panama Canal will be the providing of a market on the Atlantic coast for the lumber manufacturers of British Columbia, which will naturally have an important effect upon the lumber trade of the prairies, but in this case on the buying end, not on either the selling or shipping end.

Another element in the problem of transportation will be the opening of the Hudson's Bay Railroad, which will fill its place in acting as a preventative of a car shortage. Through these two great mediums the business world of the prairies will be placed upon a much better footing as regards transportation, and the lumber trade is looking forward eagerly to the time when the shortage of cars and the inability to move the crops will no longer be a menace to business and a contingency always to be dreaded.

Manufacturers Opening Retail Yards

Another feature of the prairie lumber trade which has taken on a growing importance during the past few years is the policy being followed by a number of the largest manufacturers who open yards on the prairies, shipping direct from the mills to their own yards and disposing of their lumber to a very great extent through this channel. This procedure is not confined entirely to the British Columbia mills. At least one of the Saskatchewan lumber manufacturers and one large Ontario concern have opened a number of yards. The statement has been made that eventually the wholesaler of lumber will be eliminated from the prairie business, and that the manufacturers will handle the lumber from the stump to the yards. It must be acknowledged that the present trend of events has a tendency even to go still farther and to eliminate all who come between the manufacturer and the consumer, including the wholesaler and the retailer. There is no doubt that this method of selling lumber has many advantages to the manufacturer who is able to secure all the profits with no greater expense than is incurred if the lumber is sold through the wholesaler and the retailer.

There are, however, a number of tangible reasons why the policy of the manufacturers owning yards does not look so attractive after a closer examination. In the first place, the lumber manufacturing business is one of great risks as carried on in western Canada in general, and in British Columbia in particular. Great sums are involved and, in many cases, lie dormant in standing timber for years. What with the wages paid for the getting out of the logs and the manufacture of the lumber, the paying of stumpage, the buying of mill supplies and the disbursements made in many other directions, the outlay of a lumber manufacturer is heavy. When it is considered that all these disbursements must be made several months before any return can be had from the lumber in connection with which they are made, it will be readily seen that vast outlays must be necessary before even the first returns are received. In the event of any financial depression or panic and sudden cessation of business, the lumber manufacturer may find himself in great straits for money. There is no doubt that in such a case it would be far better for him to have upon his books the accounts of retailers and wholesalers of standing rather than to have the individual consumers to obtain returns from, which latter must necessarily be a slow and tedious process. It must be seen that if the policy of a combined manufacturing and retail business brings all the profits, it brings risks as well, and there is no doubt that the firm or individual confining operations to the manufacture of lumber and selling through the usual channels, is eliminating many risks, which the manufacturer-retailer is obliged to carry.

Nevertheless manufacturers of lumber in western Canada are taking a more and more prominent part in the retail business of the prairies, and during the past year several large retail projects have been launched with manufacturers behind them.

Another feature of the lumber trade of the past two or three years has been the increase in scope of the yards owned by the line-yard concerns. From their headquarters in the cities these firms distribute large quantities of lumber through the medium of their yards at different points along the railroad lines. The yards owned by these concerns range in number from five to seventy-five each.

It is recognized that the individual dealer or independent dealer is losing importance gradually in comparison with the greater and greater volume of lumber sold on the prairies. There are those who claim that the time of the independent retail dealer will soon be past, and that the entire retail business of the prairies will be handled by the line-yard concerns, a number of which are affiliated with the manufacturers as stated above.

While it must be acknowledged that present events indicate a tendency to eliminate to some extent both the wholesaler and the independent dealer, there is no immediate prospect that these two important mediums will be things of the past for many years to come. Both are necessary elements in any business, and both will

continue to exist in the prairie lumber trade as long as there are opportunities for energetic and able men. The need will also exist. There will always be mills which do not care to extend their operations beyond simply manufacturing lumber, and there will also be opportunities for the individual retail dealer to ply his trade and to get his share of the business.

Wonderful Trade Extension

Spectacular, almost unbelievable, is the manner in which the retail lumber trade is breaking into new ground and spreading over new territory. The immense volume of railroad building which has taken place during the past few years, and during 1912 in particular, has opened vast stretches of new country which provide many points with possibilities for the retail lumbermen, who are not slow to take advantage of these opportunities. Most of the large line-yard concerns follow a most aggressive policy in the occupying of new territory. It frequently happens that yards are established at many points before they have been given a name, and when they are merely known by the mileage number indicating their location. Rapid though the increase is in the territory, competition in retail circles seems no less keen, and many towns suffer from a surplus of lumber yards before the population may be numbered in hundreds.

A feature which has been most noticeable during the past two or three years in the prairie lumber trade may be found in the great improvement noticeable in the individual facilities for carrying on business. Indications of this may be found in the type of buildings being built by retail lumber dealers in place of a carelessly erected building of no particular style which were common a decade ago. The common procedure now-a-days is to have an architect prepare plans for office buildings and sheds and to have the whole yards laid out with some pretence to scientific town-planning. Cases of this are noticed frequently even in the smallest towns on the prairies, and it must be said that these establishments are a vast improvement in every way over the old style of yards. In office systems, in advertising, and in other methods of carrying on business, a like procedure is very apparent.

Lumbering Operations at Lumsden's Mills

Story of the Growth and Success of a Great Enterprise in Northern Ontario—Equipment and Methods of Most Modern Type

MANY towns and villages in Canada owe their existence to the lumber industry, which forms so large a part of the country's industrial life. This is noticeably the case in the northern parts of Ontario and Quebec. Such a village is Lumsden's Mills, situated in the township of Gendreau, in the Province of Quebec, and founded by the late Alexander Lumsden, M.P. for Ottawa, who in 1887 started a large saw milling industry there. The business has been carried on successfully since 1904 by his son, Mr. John Lumsden, the well-known lumber merchant, of Ottawa, Ont.

The success of a sawmill depends in large measure on its relative location to its limits, and also upon the access which its finished products have to the different buying centres of the country. Lumsden's Mills has a location which, from a milling standpoint is unexcelled. The Lumsden limits, consisting of large areas of red and white pine and spruce, are situated along the shore of Lake Kipawa. The fleet of steamers owned by Mr. Lumsden carry men and supplies to the camps on the edge of the lake. The drives are very easy and under favorable conditions delivery of logs from the bush to the mill is made in six days.

General View of Plant and Offices—Lumsden's Mills.

The saw and planing mills are situated at Lumsden's Mills on what is known as Gordon Creek, a tributary of the Ottawa River, at the southern outlet of Kipawa Lake. It is reached by a branch line of the Canadian Pacific Railway running from Mattawa to Temiskaming and Kipawa.

Lumsden's Mills, a village of from 300 to 400 inhabitants, is owned entirely by Mr. Lumsden. Besides the saw and planing mills, head offices and large general store, the village boasts of a church, school, many good substantial homes, a large bakery and a lumber boat works. The town is lighted by electricity, generated by water power at the mill.

The sawmill was built by the late Alexander Lumsden in 1887. In August, 1904, at his death, and when taken over by his son, it was rebuilt and enlarged and fitted with the latest improved machinery. The mill, as it now stands, contains a Kendall Gang and resaw and a circular saw, as well as a lath and picket mill. The gang includes thirteen saws cutting from one inch up to three inches in thickness. It will cut cants up to thirteen inches and is especially adapted for the manufacture of lumber from small logs. Among the smaller machines in the mill are the slab resaw, one five saw edger and slash saws. The average daily capacity of the mill is 90,000 feet and the lath and picket mills make an average of 25,000 laths and 15,000 pickets per day.

Scene in the Shipping Yards—Lumsden's Mills.

The mill is driven by water power secured from Gordon Creek, on which it is built, 360 h.p. being generated in the building. A smaller power house alongside, of 120 h.p., supplies the light for the town.

The lumber is transferred from the mill to the sorting table by an endless chain system and distributed by wagons to the three yards located along the river banks for three-quarters of a mile. Private switches are installed throughout the yards and all shipments are made by rail over the Canadian Pacific Railway. The refuse from

Office of Lumsden's Mills.

the mill is conveyed through a water chute to a point nearly a mile down the river, which eliminates the danger of fire. An up-to-date planing mill in connection with the sawmill takes care of all the dressed stock. In connection with the mill is also to be found a well laid out machine shop, fully equipped with a large planer, three lathes, two drill presses, bolt machine and wood lathe, all made by Bertrams, of Dundas.

In connection with the mill operations one could not help noting the modern methods employed in the manufacture of lumber, and, as a result, the splendid class of lumber lying piled in the different yards. Only the best machinery, the best workmen and the most up-to-date systems are employed, with the results that buyers of red and white pine and spruce from Lumsden's Mills realize that they have a line of lumber that in quality and manufacture can be thoroughly relied upon. Mr. W. H. Cowper, the manager of the mills and woods operations, is a thoroughly experienced lumberman of long standing. He has been in the employ of the firm for over twenty-six years, and for the past eight years, Mr. Lumsden's manager. A line of steamboats are maintained by Mr. Lumsden on Kipawa Lake for passenger, freight and towing purposes. These are the "R. Hurdman," "Emma Mac," "Quebec," "Otter" and two other smaller yachts.

At Lumsden's Mills is also located a large boat works manufacturing "Pointers" and Winch boats for lumbermen. With an experience of over twenty-five consecutive years in the "driving" and "sweeping" of logs down the Gatineau River to the Ottawa and from the head of the Quinze River through to the Des Joachim and from Kipawa Lake to the same point and in a general lumbering business in the Temiskaming and Kipawa Lakes country, pressing need was early felt by the late Mr. Alex. Lumsden for the best lumberman's boat that could be built. To fill that want he, being a prescient and practical man, secured good workmen, started a boat works and had his boats built after his own ideas and design. For his extensive operations Mr. John Lumsden decided to enlarge the scope of the boat works and manufacture for the markets. Great success has been attained in this and the Lumsden Boat is now being used by many of the largest lumbering firms in the country.

Mr. Lumsden is connected with a number of other successful companies and is president of the Lumsden Mining Company, Cobalt, Ont., head office, Ottawa, Ont.; the Dominion Explosives Limited, head office, Ottawa, Ont., and the Electrical Company of Canada, Limited, head office, Toronto, Ont.

Plenty of Lumber and Power—Lumsden's Mills.

A Lumberman's Motor Truck

A practical solution of the problem of handling lumber and reducing handling cost has been secured by many lumbermen in Canada by the use of motor trucks in the yards. Those who have experimented along this line claim that horses cannot compete with these trucks. One of the firms who are catering to the lumber trade along this line is the Schacht Motor Car Company of Canada, Limited, Hamilton, Ont. This company is turning out a line of trucks specially adapted and designed for heavy duty service. The trucks are built in sizes of 1-ton, 2-ton, 3-ton, 4-ton and 6-ton normal capacity.

The Schacht truck shown in one of the accompanying illustrations is a two-ton truck used by the Dominion Power & Transmission Company of Hamilton, Ont., for hauling towers forty-five feet long, by use of a two-wheel trailer. Each tower weighs fifteen hundred pounds and four are hauled at a load. The engine is en-bloc type and develops 45 h.p. The axles are drop forged. The frame is rolled steel channel. There is ten feet of loading space back of seat. The wheels carry tires 36 x 3½ in. front, and 36 x 3½ dual in rear. The wheel base is 132 inches and the maximum speed is sixteen miles per hour on direct.

Schacht Truck for the Dominion Power & Transmission Co.

Schacht Truck for Delivery of Cases of Bottles.

The second illustration shows a Schacht truck used by the Cocoa Cola Company for hauling cases of bottles to be distributed to their various branches. This truck has centre rack to which all cases are inclined.

One of the trucks specially adapted to the lumber trade is described in the Schacht Company's advertisement, to be found on another page of this issue.

The company have a large and fully equipped, up-to-date plant at Hamilton, Ont., with Mr. F. L. Reid as general manager. Mr. Reid previously held a similar position for two years with the parent company in Cincinnati.

A Growing Industry in Eastern Quebec

Pulp and Paper Making at Bromptonville and East Angus—Remarkable Expansion of Progressive Manufacturing Company

The pulp and paper industry of Canada has developed greatly of late years, owing to the increasing demand from the United States, and to the depletion of the spruce forests of the Eastern States. As a result numerous plants have been erected in Canada, more particularly in Quebec Province, where the pulpwood resources are said to be practically inexhaustible.

General View of Works of Brompton Pulp & Paper Company at Bromptonville, P. Q.

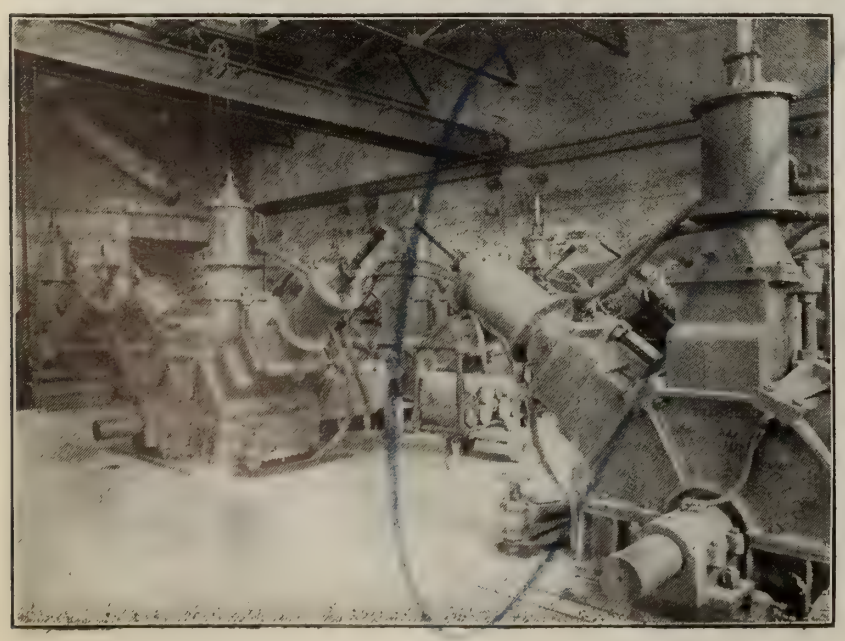
One of the first to realize the possibilities of this industry was Mr. E. W. Tobin, M.P. for Bromptonville, Que., who, in 1898, organized the Brompton Pulp and Paper Company. Since that time the company has been making steady progress and to-day is in the foremost rank of manufacturers, owning and operating mills at Bromptonville and East Angus, Que.

A fine power just below the village of Bromptonville was the first to be developed. A pulp mill was erected and fourteen grinders installed. Also the lay-out for a large paper mill was provided. Limits further up the river were acquired and the mill was run at full capacity from the beginning. It soon became apparent that an extension of the plant was necessary, and two years later the Brompton plant was enlarged by the installation of seven more grinders. It is, therefore, now operated as a 21-grinder mill, making ground wood pulp, and with a full head of water has a capacity of 140 tons per day. About 120 hands are employed at this mill.

Have Splendid Power

The company estimates that it has for its purposes here 10,000 h.p. For six months of the year it actually reaches this. Back of the Bromptonville power is not only the St. Francis River, but the Magog River as well, which joins the St. Francis at Sherbrooke, and also the Massawippi which unites at Lennoxville.

The Bromptonville power is capable of important additional development. This will be accomplished either by another dam a little higher up the river or by raising the present dam some 12 feet. The latter is the more likely proposition, and when carried into effect will increase the present development power by at least 33 1/3 per cent. This work is to be undertaken in the near future.



Part of New Generator Room, Brompton Pulp & Paper Company's Plant, East Angus P. Q.

of the Brompton Pulp and Paper Company's operations. In May 1907, the company purchased the mills and limits of the Royal Paper Mills Company, at East Angus, on the St. Francis River, sixteen miles above Sherbrooke city, on the Quebec Central Railway. It was at this time that Mr. F. N. McCrea, now parliamentary representative for Sherbrooke, and the smaller portion the present head of the company, became interested in the company, taking a large holding. The developments, improvements and extensions of the East Angus property have been a feature of the company's recent operations.

The Bromptonville mill is but a portion and

The Brompton Pulp & Paper Company is now organized as follows:

President, F. N. McCrea, M.P., Sherbrooke. Treasurer, W. N. Munroe, Lewiston, Me. General Manager, J. A. Bothwell, East Angus, Que. Directors: E. W. Tobin, M.P., Bromptonville; E. P. Lindsay, Boston; C. C. Wilson, Lewiston; H. E. Munroe, Lewiston; W. J. Pennell, Lewiston; H. E. Wilson, Lewiston.

The East Angus Plant

The East Angus plant consists of paper mill, sulphate pulp mill, two ground wood pulp mills, and sawmill. The paper mill has undergone important changes and improvements since it came into the hands of the present company. It has two paper machines with a capacity of about 30 tons of kraft paper per day. This kraft has gained a wide reputation because of its fine quality as wrapping paper, giving the maximum of strength per pound weight. The mill is operated at full capacity and consumes a large portion of the product of the adjacent mill.

When the Brompton Pulp & Paper Company purchased the property, this mill was operated as a soda pulp mill, but they changed it to a sulphate mill, the first of its kind in America. The plant was practically rebuilt, and has been running on the sulphate process for over four years. The pulp which is not used in the paper mill is shipped to different parts of the country. A feature of the sulphate

Section of New Wet Machine Room, Mills of Brompton Pulp & Paper Company, East Angus, P. Q.

pulp is the quality of strength which it gives to the finished product, the kraft paper.

In the vicinity of the paper and pulp mills is located the company's sawmill, the output of which is some 7,000,000 feet annually in dimension lumber, shingles, clapboards, etc. 2,000,000 feet of this is hardwood for the English market.

These plants are operated on the company's lower power at East Angus, where about 3,000 h.p. is available.

The New Dam and Plant

In May, 1910, the company begun the construction of a new ground wood pulp mill, three-fourths of a mile up the river, at a magnificent power, which had already been partially developed. This development was completed, the pulp mill erected, and on January 31, 1911, the production of pulp was begun. Twelve Jenckes grinders are installed here and have a capacity of 84 tons per day. This is one of the most modern pulp plants in the Dominion. The pulp is pumped through a 16-inch cast iron pipe, for three-quarters of a mile, underground, to the new wet machine room.

The new wet machine room is 100 by 200 feet, built entirely of concrete and steel, has ten 84-inch wet machines, built by the Sherbrooke Machinery Company, and fitted with eight Manson Centrifugal Screens. All the wet machines, screens and pumps have an individual electric drive.

Continuing its policy of development, the company, during the past year, has constructed another pulp mill, for ground wood pulp. This is now in operation. Eight grinders are installed here, with a capacity of 60 tons. This mill was started on February 20th of the present year. The total capacity of the mills is 150 tons per day, 100 tons of ground wood and 50 tons of sulphate. Among the recent additions to the plant is a new 112-inch paper machine installed last year.

The mills of the Brompton Pulp & Paper Company have to a great extent resulted in the building of two very prosperous towns in the Eastern Townships. East Angus now has a population of 2,700 people. Over fifty houses have been built during the past year, and others are being erected as rapidly as possible. Bromptonville has about 1,500 population and is a prosperous community.

During the past year the company have purchased the interests of the Champoux Lumber Company at D'Israeli, the Emberton Lumber Company at Scotstown, and T. M. Craig at Reedsville, these being the only other large operators on the river. This enables the company to control the flowage of the river, which has a drainage area of 2,561 square miles. Tributary to its mills within this drainage area are: Lake Aylmer, Lake St. Francis, Lake Felton, Lake McGill, Lake Taure, Lake Algin, Duck Lake, Cariboo Lake, Trout Lake, Bear Lake, and several other small lakes, which constitute a vast storage basin of 132 square miles. The company has dams at the outlet of these lakes, and can regulate the flow of the river, ensuring a steady and ample power for the industries at East Angus and Bromptonville, and in addition they have the advantage of the Magog River storage, amounting to 110 square miles. This vast storage area already under control makes the St. Francis River one of the most permanent rivers for power purposes in the Dominion, enabling the mills to be kept running at full capacity the year round.

The Timber Lands

The Brompton Pulp & Paper Company now has about 276,000 acres of timber land, much of it virgin forest. This vast acreage of

woodland is all located within the basin drained by the St. Francis River and its tributaries, so that pulpwood and logs from any part of the limits can be driven to either the East Angus or Brompton-ville Mills.

The company is constantly increasing its holdings. In March last it purchased the Roberge mill and 5,000 acres of lands at Garthby and Lambton, all tributary to the St. Francis. It is estimated that the limits belonging to the company are practically inexhaustible. This permanence is assured by the company's policy of conservation. At least 50 per cent. of the annual supply of pulpwood is purchased from settlers and farmers, so that only about one-half of the year's consumption is drawn from the company's limits. The annual drive is about 90,000 cords. About 33 1/3 per cent. of this goes to Brompton-ville, while the balance is disposed of at the East Angus plant.

The pulp, paper and timber industries of the Eastern Townships represent an important portion of the wealth of this district, and the Brompton Pulp & Paper Company will undoubtedly continue to hold an important place in the industrial records of the district.

Design and Equipment of a Modern Mill

Economy of Space Secured Without Sacrifice of Essential Operating Requirements—Wayagamack Company's New Mill Near Three Rivers

Rear of Mill and Sorting Shed—Wayagamack Sawmill

Log Haul-up and Mill Pond—Wayagamack Sawmill

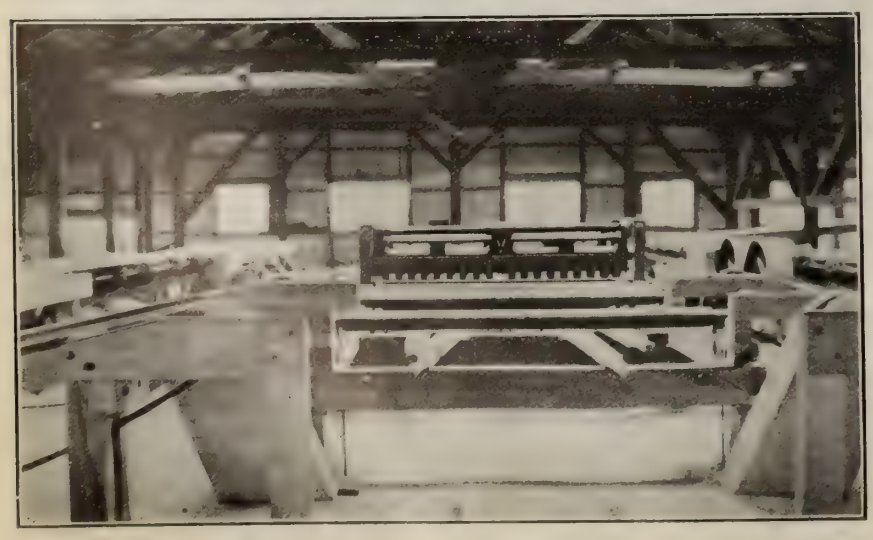
NEAR Three Rivers, P.Q., the Wayagamack Pulp and Paper Company have recently completed the erection of a new sawmill which has been designed and built with a view particularly to the conversion of the company's larger spruce trees into high class lumber. When the Wayagamack company took over the 1200 acres of limits formerly belonging to Alexander Baptist they found that much of the spruce timber was too large to be readily converted into pulpwood and that they would have to erect a mill to turn it into lumber. The mill has now been completed and is one of the most thoroughly equipped mills to be found in Canada.

Power Plant

The engine and boiler houses which adjoin the main building are built entirely of brick with steel roofing, are excellently ventilated and well lighted. In the boiler room which is 49 ft. x 54 ft., five 72-in. x 18-ft. return tubular boilers built for 150 lbs. steam pressure supply steam for the plant. The boilers are arranged in one battery suspended from overhead and provided with Dutch oven for burning sawdust and refuse. They are carefully bricked in and the brick front is covered the entire length of the battery with an iron face plate to give a neat, clean appearance. A steel sawdust deck 8½ feet wide extends across the entire length of the battery and forms a storage for fuel to feed the furnaces while the mill is shut down or is not supplying enough fuel. The boilers are fed automatically from horizontal conveyors which empty into the steel troughing and are connected with the furnace feed openings by steel discharge spouts. Each boiler is provided with a "Vulcan" soot cleaner and is connected by a steel smoke breeching to a brick smoke stack 150 ft. high, 72 in. in diameter. Above the boilers, a large header extends across the battery and is fed by steel U-pipe from each boiler. The steam from the header is carried into the engine room by a 10-in. pipe which passes the steam through a large capacity steam separator before it is fed to the engine. A 6-in. main from the separator carries into the sawmill the steam necessary to operate the steam actuated machinery.

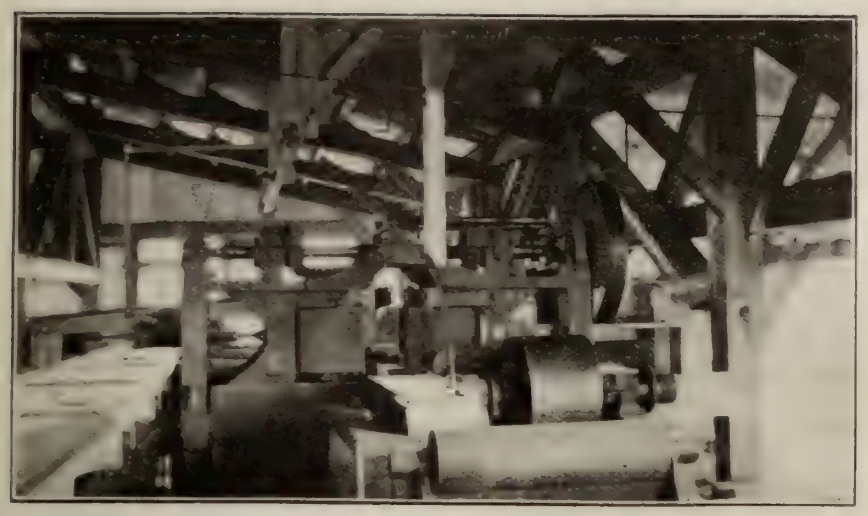
In the engine room, which adjoins the boiler house, a "Waterous Heavy Duty Saw Mill Engine" drives directly on the two line shafts of the sawmill proper. This engine has 24-in. x 30-in. cylinder, is equipped with improved rocker valve gear, and carries a fly-wheel pulley 13 ft. 0 in. x 3 ft. 6 in. The engine room also contains a 30-40 h.p. engine, which drives the fuel conveyors. This is provided so that the boilers may be supplied with fuel when the mill is shut down and steam is needed in the pulp mill.

The sawmill itself is 160 ft. long, 53 ft. wide at its greatest width. It is set back some 36 ft. from the water's edge and it, as



Double Sided 72′ Champion Edger—Wayagamack Sawmill

General Interior View—Wayagamack Sawmill



Behind the Resaw—Wayagamack Mills

well as the trimmer and sorting shed which adjoin the mill, are built entirely of selected fir, the framework being covered completely with corrugated iron sheeting. The roofs of the three buildings are also of corrugated iron, that of the main building being fitted its entire length with wire glass skylights so that the mill floor will receive an abundance of light from overhead. Numerous large windows on every side also aid in lighting the mill, with the result that there is not a dark corner to be found in the building. What impresses one most upon a casual survey is the amount of space and freedom from cramping that is evident. This is due entirely to the excellent arrangement of the equipment and the large amount of head room that has been allowed in the construction of the mill. The uprights throughout the main building are selected 12 in. x 12 in. timbers, each set on an individual concrete pier which is iron faced to receive it. The rest of the timbering is proportionately heavy and the effect is one of great solidity, strength and permanence.

In the main building, as in the rest of the mill, much thought has been given to the arrangement of the equipment in order to secure economy in operating space and to reduce the time of handling the stock being cut. This has permitted the elimination of several machines generally considered indispensible in a plant of this size and the substitution of machines of smaller capacity than would be considered necessary under usual conditions and with the old style of mill arrangement.

The logs entering the mill are handled by adequate log deck equipment, including two double arm 10-in. log flippers, two 10-in. log loaders, and two 8-in. x 10-in. x 60-in. stationary steam niggers. From this log deck, the logs are sent either to the right or left as desired, where they are taken care of by two double cutting 8-ft. band mills. The carriages which supply the mills have 42-in. and 36-in. knee opening respectively, with log seats of steel. They are fitted with steam setter and operated by gunshot feed. Leaving the carriages the boards are carried by live rolls and transfers to a double-sided 72-in. New Champion edger, which is designed to handle cants up to 6 in. thick. Slabs are either sent direct to the 5-saw slasher, and from there to lath mill or hogs, or are passed through a 42-in. circular resaw. A second, smaller, 40-in. edger takes care of the boards from the resaw, the discarded slabs being transferred across the mill to the slab slasher, and to the lath mill or hogs, as the case may be.

The Filing Room—Wayagamack Mills

Leaving the edgers, the stock is conveyed to a transfer table, and delivered to a two-saw trimmer 31 feet in length and arranged to trim from 6 to 16 ft. boards. From the trimmer the trimmed boards go to a 100-foot sorting table, where they are carefully graded.

The filing room, built with plenty of head room, is well lighted from the roof and from the sides and generally laid out and equipped to give the greatest convenience and ease in handling the saws. It is located directly above the band mills, and the saws are elevated and lowered through trap doors by a special wrought iron tackle, which makes an exceptionally fast and safe rig for getting the saws on and off the mills. The filing equipment consists of two Covel automatic band saw sharpeners and one Covel circular saw sharpener, one power saw stretcher, one emery wheel lap grinder, a set of shears and a brazzing forge. A small 10 h.p. vertical engine operates the filing room machinery, independently of the sawmill proper and thus the filing room is in commission at all times.

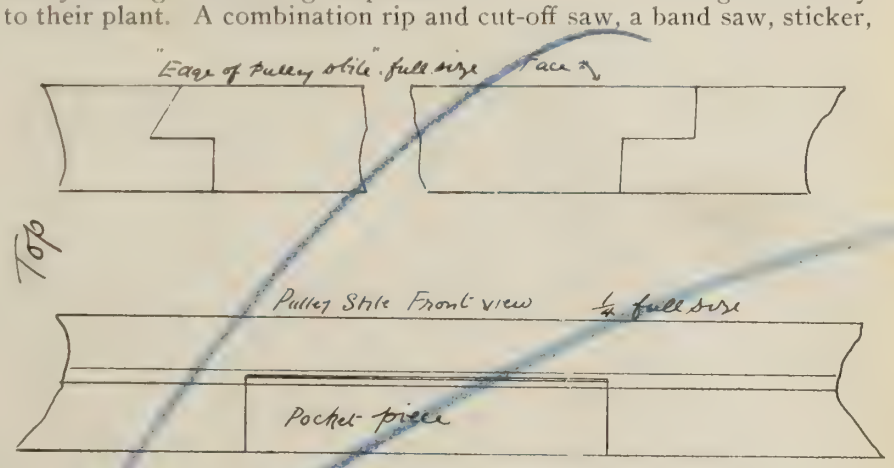
Capacity of the Mill

Since commencing operations in June of this year, the Wayagamack mill has more than exceeded the most sanguine expectations. Designed for a daily cut of 100,000 feet this figure has been easily reached and on more than one occasion a cut of from 30,000 to 40,000 feet over and above this estimated capacity has been made. This exceptional success reflects most favorably not only on the management and personnel of the mill itself but also on the Waterous Engine Works Company of Brantford, Ont., by whom the mill was designed, built and equipped in its entirety.

Practical Suggestions for Shop Practice

Written specially for the Canada Lumberman by Frank Bowers

With the advent of cheap power there is a very marked tendency among contracting carpenters to add wood-working machinery to their plant. A combination rip and cut-off saw, a band saw, sticker,



A Good Way to Cut Pockets for Frames

pony planer, and jointer, seems to be about the extent of the general investment. Whether it will pay in the long run remains to be seen. I have spoken to several, and they are hopeful that by buying their material in car lots enough can be culled out to do general joinery work. Then on wet and stormy days surplus labor can be utilized to advantage. Some I know made all their frames last winter for this season's work, and again where only one or two pieces of work are wanted or those of odd size and shape, they are knocked off hand instead of waiting to have them shipped from a larger establishment.

In the accompanying cut will be found a much better way to cut pockets for frames than the usual way—(this refers to those who have no machine for cutting them, and hundreds are still cut by hand). The usual way is to make two long bevelled cuts the length of the pocket—apart in the pulley stile. Then the pocket piece drops out. To fasten in again two nails are driven into the top bevel on pulley stile endwise about half its thickness to centre line of nails. Then two grooves are put into the back of pocket piece with chisel or parting tool to receive nails. Then pocket piece is inserted and a rap or two with the hammer is given to it at the bottom end on the face side which forces it up into the nails snugly. Then a screw No. 9 or 10⅞ is put through bevel at bottom end, and the pocket is firmly in place, but it stands above the surface of pulley stile owing to material being taken away by making bevelled cuts. This must be jacked and smoothed off before it is complete.

This is a process both tedious and expensive inasmuch as it wastes time and material. Here, in the cut you have an idea that will save, I know by actual practice, in time alone, three hundred per cent. After you have satisfied yourself that it is a better way, and I am sure a little practice will convince you, take a piece of board about 5 or 6 feet long and 7 or 8 inches wide. Nail or screw on one side a strip about 1 in. x ⅞ in. Then at convenient intervals

tack a block or two the same distance from the strip as is the widths of pulley stile. Now you have a board that will last you with careful usage as long as you want it.

Now then a batch of frames is wanted right off, bricklayers are waiting, and we all know what that means. I won't put it down here, (I might be in jeopardy of getting six months). Take down your board. Tack to bench. Take pulley stile, the cut in parting strip groove having been previously done on rip saw. Place pulley stile on board. It is held firmly by strip and blocks. Take a small back saw, about 7 in., usually termed a dovetail saw, and about 8 in. up from bottom of pulley stile, put a square cut from inside edge to parting strip groove. Cut under a little so as pocket piece will clear nicely on being removed. Then decide on lengths of pocket which will be determined by size of frame. Make the top cut square across same as before, but bevelled well under. Both of these cuts will be half thickness of pulley stile in depth. Turn over end for end and about 5/8 higher than the cut at bottom on face put in square cut half thickness down, and at upper end put in cut 5/8 lower down from face cut. That is all there is to it. Your pocket is cut and no nail or screws or facing off are required.

Be careful about cuts at lower end to give clearance, because the longitudinal face line of that pocket piece is really the radius of a circle and the cuts, if they were square down, would be tangents and would bind and therefore are cut under to conform to the circumference.

Now a word as to removing the pocket piece it will be observed that the only thing holding is the short grain between cuts, which can be readily broken by a slight tap with the hammer at lower end on the inside, which is best done after frame is together and before back lining is put on. But if it is forgotten, it can be easily done by the man who is about to hang the sash. Remove parting and inside beads. Insert wide chisel in groove and pry outward at the same time giving a smart rap or two at bottom, when it will be found to break off with ease and the parting and inside beads hold it firmly when replaced. I can safely say by practical experience this is much the better way and you can cut your pockets like cracking nuts, and a great deal quicker than some nuts we have to crack.

From a Foreman's Viewpoint

Written specially for the Canada Lumberman by Hapsburg Liebe.

To know of the difficulties encountered in the endeavor to act as a successful go-between, with the employer calling for results on one hand and the employees to keep satisfied and working to an advantage on the other; to know of the thanklessness many times met with while conscientiously trying to please all parties concerned, one must be—or have been—a mill foreman himself. I believe that I may speak of the subject in hand with authority; I have been foreman, and I have been employee, the latter from shavings boy to full charge of the filing rooms in very fast double band mills. Moreover, I have known many other foremen, and some of their troubles came under my notice.

True, it is an extremely gratifying position when everything is running smoothly; when the employees under one are good men and men of fair experience—else very willing to do the right thing, if they are green; when the employer expects but a reasonable amount of work, and there are not too many breakdowns. But it is not of the brighter side that I wish to speak, because it needs no elaboration. And this brighter side with its glories comes along with far less frequency than is observed by the superficial eye.

To take up the question of problems, I think the relating of one, just as it occurred in actuality, will be more interesting than ever so much preachment. Far from the least of the foreman's troubles is—

The Dissatisfied Employee

A foreman over the men in a large single band mill cutting soft woods exclusively told men one day that he had at last boiled things down at his plant until there was never the slightest hitch unless it was brought about through some minor break in the machinery. He appeared to be very joyous over it; perhaps he had drunk of the bitter so much that a taste of the sweet had turned his head.

And just one month later this same foreman told me that if he knew the next two weeks would be like the last that he would leave his job on as little notice as he could decently give, even if he had to hustle sawdust for a living. I asked him what was wrong, reminding him that he had told me shortly before of the satisfaction he was having at his mill. He gave me the whole story:

"A few months ago," he said, "one of my men got sick, and I had to take on a new man. This new employee was one of these bad potatoes that spoil a whole barrel; he was a smooth talker, and all he lacked of being an anarchist was the opportunity. Within three days after I had my last talk with you, I found that he had chinned the other fellows, men who had been giving me the best of service without the least grumbling, into the notion of striking for higher wages—and we were then paying as much as any other mill in the section. And he was so sly about it that I knew nothing of it until the whole outfit approached me in a body one evening, and, with the embryonic anarchist for a spokesman, declared their intention of seeking work elsewhere unless I added ten per cent. of their wages.

"Now, this man's very manner was one that was insulting to me. He addressed me in a way that subtly carried to the minds of the other employees the idea that I was strictly a skinner in the name of the company. I felt very angry; I could well have fought him then and there for his confounded impudence. But I held myself in, and told him that I would see the Old Man about it. I did that in order to gain time; I had never confronted just such a problem before, and I wanted to think over it. You see, there were none too many men to be had, and a shut-down of a week or so, with the yard pond full of logs, would have meant something of a loss. But I told them to trust me to do the right thing, and that I thought the Old Man would do the right, asking them to come back in the morning.

"It may appear to you that I should have had more influence over my men than had this bad potato; but please remember that this bad potato had been secretly at work for some time, also bear in mind that a foreman may not be on very intimate terms with all those under him unless he wishes to have advantages taken of him because of the friendships thus existing.

"I went to my employer and placed the matter before him; there was nothing else to do, although I disliked to bother the Old Man. He got up in the air at once, and asked me why I didn't fire the bad potato the minute he approached me—and his manner was not in the least a disguise of his real feelings; it said that he considered me a fool, just as plainly as if he had voiced it in those same words. He told be to find the dissatisfied man and fire him immediately.

"I knew where to find the boys, which was at a favorite loafing-place, at one of the stores. I walked in, called their leader out to one side, and told him in as nice a way as I knew that he no longer had a job under me—although I felt like trying to break his neck while doing it. He turned and motioned for the other fellows, telling them in rather vivid language that I had discharged him, and asking them if they were going to stay by him in the movement he was pleased to term The Cause. They were, and of course I was all sorts of a fool. I was hand in hand with trusts and iron-heeled monopolies, a traitor to the workingmen's side, a turncoat, a throttler of the throats of the poor. And they did stick to him; and the whole of the next week I spent racing here and there on the hunt for men. Now, I'm into the business of reorganization up to my ears."

That was his story, and I learned afterwards what I never doubted: That it was true, every word of it. Now, how many thanks did that foreman get for his earnest attempts to bring matters to a state of common satisfaction between his employer and the employees? Both virtually insulted him. He was given no credit for anything. If he had fired the dissatisfier of his own initiative, at the first, he would have but precipitated the shut-down then and there; by delaying the thing, he had a slight chance of a reconciliation—even if it did fail in the end.

A foreman may not always know of the secret work of the bad potato in time to get him off the job before he has spoiled the whole barrel; but if his presence is known in time much unpleasantness may be averted by letting him go immediately. He doesn't deserve another chance; such a chance is given at the jeopardy of the foreman, the other employees, and the welfare of the company itself.

The man whose trouble with a dissatisfied employee has just

been related touched upon a question that no one out of three will pause long enough to consider in its true light. It is that of a foreman's necesarily not being upon especially intimate terms with his men. You, reader, might not take advantage of this friendship, and I might not; but there are others who certainly would. Many a good foreman is called a prig and a swell-head because he has enough sense and experience—partially, I daresay, the latter—to mildly and diplomatically hold himself aloof from cultivating intimacies in general among those holding places beneath him.

And then, there is another reason for this aloofness that is so frequently misnamed. The foreman couldn't be friends with all the men under him; differences in beliefs, in temperaments, in views, would prevent it. Suppose, then, he has, say, half a dozen intimate friends among the crew, how long will it be until somebody will say that he is partial to that six? It won't be a week, take it from me. Thus will begin a thread of dissatisfaction that will grow bigger and bigger, and spread wider and wider, although at the outset it might have been merely a chance phrase, or a casual remark, and meant for nothing whatever. This is the well-spring from which will emerge more than one dissatisfied employee—and thus a bad potato forms in the barrel to spoil the others.

It must not be understood that I have in the least a small opinion of those who work under a foreman, for such, I assure you, is far from being the case; I have been there myself, and I know the life from the ground floor to the top of the smokestack—and from experience, that truest, if dearest, of teachers, I know that all men are human and therefore prone to err. And there is always somebody at our elbows who will not see these matters in the light in which you and I see them, taking it for granted that you and I view things in the correct light; and constant association with these men will certainly influence us—slowly at first, perhaps none at first, but we will finally bend to the other fellow because we are human, and thus our formerly rational views of things as they ought to be will get more and more unreal and blinding and distorted.

The Satisfied Employee

He is a jewel, to himself, to his associates, to his foreman, and to his employer; he is indispensable to everything in the scheme of the whole universe; upon his shoulders rests the welfare of the world—and to him it is a pleasure rather than a burden to bear this weight.

The first step toward this big place—to those who have not quite reached it—is the ability to understand that there is no perfection on earth, and least of all where the hand of business must keep itself busy or be rooted out and relegated to the rear; and with the ability to understand must go the capacity for making allowances for those daily things in the guise of nuisances that occur to disturb the peace of one's mind by breaking through system and routine. To fly off the handle when the least difficulty arises, to swear at everything under high heaven, and fling tools through the windows, and malign the Old Man to his back, to get mad and tell the foreman to go to torment for all you care; all this is the easiest bunch of things in the world to do—and the most foolish as well. It will hold good nine times out of ten. The easiest things are not the best things; anything under the sun that is worth while is also worth working for—and one usually has to work if he gets it.

The word "satisfied" does not quite embrace all that I should like it to embrace in this connection. I do not mean to say that a man should be satisfied to drive along in the same old channel, contented with his level and unambitious to rise in his sphere, with no desire whatever to work to a better position; instead, I mean that a man should not be dissatisfied in the way by which he hurts himself and everybody else with whom he is in touch, but dissatisfied with it. This is bound to show results in time. It may take the foreman and the employer a year to learn your name, but when they learn it it will stand for so much that they will not forget it. Thus you are in line for a better job.

This jewel of a man of whom we are speaking knows that he is not expected to raise his hat to the superiors when they come around, that he may be respectful without being slavishly servile. He knows that the foreman has a job to hold as well as himself, and he is willing to contribute his quota to that end because it is right. He knows that with the foreman, as with the employer behind him, it is purely a business proposition, because it has to be that to be a proposition at all in the modern gamut of things. He knows that when a yes or a no will suffice as an answer to a question that to waste words is to waste time—which is always money in the sawmill business. I know of nothing that a genuine business man dislikes so much as this way of talking much with one's mouth —if I may be permitted the colloquialism.

Meaning overdone system, and, in this connection, when it has its origin in the office. For system in the management of a sawmill—or in the management of any other manufacturing industry, for that matter—may be easily overdone. Red tape costs more by the inch, foot or yard than any other kind of tape in the world; it creates insubordination and disinterestedness with employees who would otherwise be good workers and with whom one could rarely pick a flaw. As time is necessary, usually, in carrying out overdone system, it is therefore time taken from the actual work; and, while the object is to save, it never fails to waste more than it saves.

I once worked in a mill and factory combined in which we had but half an hour at noon, during which time the men were expected to punch the timeclock twice—it was two hundred yards from the job, by the way—in addition to eating their lunches, doing their oiling, and lacing any belts that needed it. The red tape came in the business of registering in and out, and was unnecessary because the foremen of the different departments were right there to see that each man was at his place. Of course a change from half an hour to an hour at noon would have given time for all this; but the office wouldn't have it that way. Now for the results:

The log sawyer, prior to the before mentioned arrangement concerning the timeclock, had been changing saws at noon; he now found it necessary to make the noontime change during work hours, which was at least half an hour lost each week. Half an hour at seventy-five dollars a day is what? Wouldn't it have hired a pretty good man? Well, yes! The band ripsaw operator in the dimension-stock department below stairs, as well as several men running round saws, did the same thing. Steam lagged a bit after the mill started at noon because the firemen had so many things to do that they couldn't get around. Do you suppose the employees of this concern worked any harder because of this bit of crimson ribbon? No.

At another plant, at which I was the filer, I had to save all old files and turn them in at the supply department before I could get new ones—the rule there, you see, was to account for everything. Any sawmill man knows that an old file is one of the most generally useful things in the world; but here I had no chance for an old file because red tape had decreed not. Also I had to turn in the worn out filing room brooms before I could get a new one, which kept me from having a stubby brush with which to sweep off the saw teeth preparatory to swaging—until I bought one myself. Emery wheels the same way. Also I had to keep a record of the saws we used, what became of them, and all. This certainly was overdone system. And I sometimes wonder if it had anything to do with the concern's going to the wall, dead broke, within four years of the mill's starting up?

And where was it that I heard of a passerby running into a planing-mill, apparently excited, to butt into a youngish member of the firm and by him to be ordered immediately and authoritatively to repair to the office for the transaction of any business that he happened to have to transact—and upon going to the office, this passerby very calmly and casually remarks that their plant is on fire! Would it have been in the least undeserved if these people had lost their building and machinery?

The Employer

As there are differences in employees, just so are there differences in employers; it is but natural. But the employer is usually a much harassed man; he has a thousand and one matters to keep in mind if he keeps in business—and, as I am perhaps fond of saying, he is not in business for his health. Worry will account for much of his apparent gruffness. Competition at the present day is sharp, and he knows that there has been more than one fortune lost in the game of converting trees into boards.

Still, while it may be optional on his part, there is room for kindness to those who work for him; and I know of nowhere else where it is possible for kindness to be appreciated more.

At one of the biggest mills that I have ever seen, which is a branch of a very large company with main offices in one of the great eastern cities, the general manager, who was virtually the employer in this instance, found it to his advantage to accept another position. He had been very kind to his men whenever it was possible for him to get out among them; he had been as jovial as a boy with them, while never departing from the strict routine of business one iota. Therefore it was with real regret that the men of the mill, as well as those of the yards and woods, learned of his intended departure.

To show their appreciation of this sterling man, these employees each gave a dollar into a common fund and bought a diamond ring for him, keeping it secret until the day on which he was ready to leave for his new location. When he was presented with the bit of jewelry, which so well set forth the sentiments of scores of hearts, he took off his hat and faced them, meaning to thank them. But the thing had overcome him, and he couldn't say a word. However, the men understood, and that moment of silence was more impressive and more eloquent than any speech he could have made. He could have taken all those men with him.

Such kinship as this, between employer and employee, is too rare, perhaps. But who can say that there is anything finer in the whole world?

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

The International Endless Chain Saw

The Endless Chain Saw manufactured by the International Endless Chain Saw Company, New York, is a machine of the greatest interest and value to the lumbering industry. It is adapted to a wide variety of purposes, and has important advantages over other types of saws now in use. It requires no foundation. Excepting when installed at the mill it need not be level. The power necessary to operate the Endless Chain Saw is about one-quarter the power required to run other saws of less capacity. It is not limited to small sized timber as it is built to handle trees up to 25 ft. in diameter. Its maintenance cost is claimed to be less than that of other machines and it is absolutely safe.

3½ 6" Portable Combination Felling and Cross Cutting Endless Chain Saw

The construction is very simple. A blade or distance piece determines the maximum capacity of the machine. This may be two feet long or longer, as local conditions make necessary. At either end of the blade are sprocket wheels, one of which drives the saw. The other is simply an idler, but so designed as to maintain a slight tension in the chain. This tension is maintained by a single spring working through a lever at the outer end of the blade. The chain is composed of a series of flat links which are riveted together (cold rivets) making the chain easy to repair or replace, and having a great advantage in case of breakage. By the inserting of an extra tooth or two it will maintain the original and rated capacity of the saw. These repairs can be made in two or three minutes.

For cross-cutting, the Endless Chain Saw is particularly serviceable, and its cutting speed is remarkable in woods of all descriptions. For felling standing timber, the Endless Chain Saw is extremely portable, and as the saw blade can be swung to any position or angle it is unnecessary to level the saw. It is therefore a universal machine for felling and for cross-cutting in the woods.

The rig is mounted upon a sled which is drawn by a horse. Upon the sled is mounted a turntable supporting a four-cylinder, four-cycle gasoline engine which permits the engine to swing to either side of the sled. At the front end of the engine are mounted the Chain Saw and its bearings. There is also mounted upon this sled a water radiator for cooling the gasoline engine. This saw, like all other saws manufactured by this company, is ready for work immediately when delivered to the purchaser, and no time is lost in installation, as is frequent when other machines are installed.

The Endless Chain Saw is now used by some of the largest and best known concerns in the world. The best proof of the value of the machine is the fact that repeat orders are being received by the International Endless Chain Saw Company from its customers.

The company is prepared to supply machines on short notice and full information regarding all details may be had from them by writing to the International Endless Chain Saw Company, 34 University Place, New York, U.S.A., giving the conditions under which the machines are to be used, together with the average diameter of the logs it is to work on, and also the largest logs which may be met with.

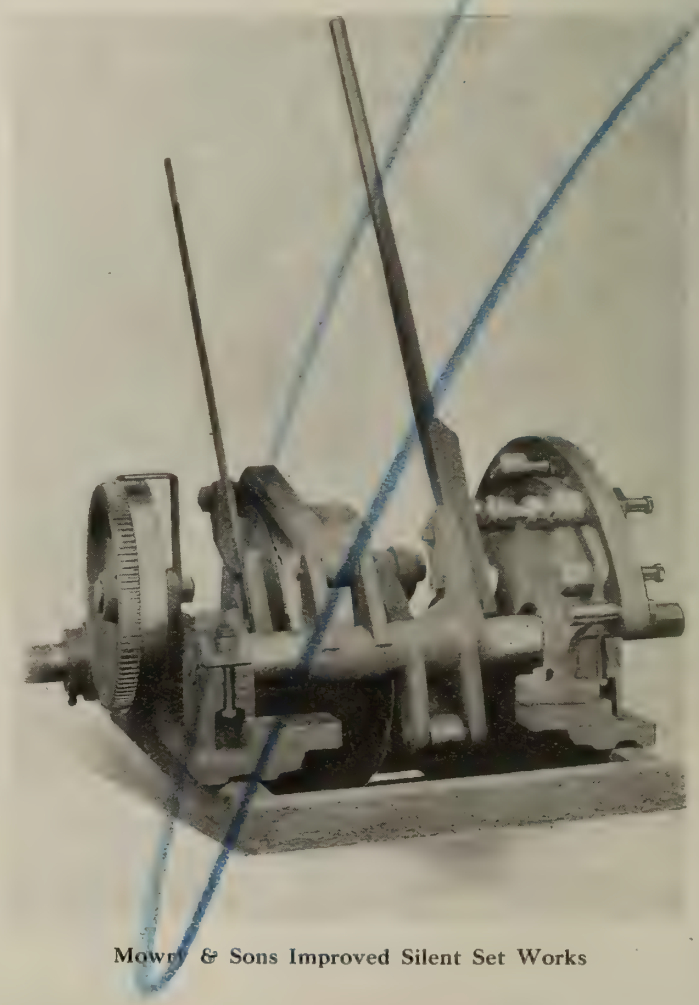
New Fay & Egan Catalogue

J. A. Fay & Egan Company, Manufacturers of the "Lightning" line of woodworking machinery, have just issued a new catalogue which is of interest to every owner and user of woodworking machinery. This catalogue, known as No. 86, is published in a size convenient for handy reference and in its 352 pages are illustrated and described all of the many improvements made in woodworking machines in the past year. The catalogue is really a text book on woodworking machines, and is evidently an expensive proposition to print and circulate. The Fay & Egan Company advise us, however, that they will be glad to send a copy, charges prepaid, to any owner or user of woodworking machinery who will address them on his own or company's letter-head as follows: J. A. Fay & Egan Company, 465-485 West Front street, Cincinnati, Ohio.

Mowry & Sons Improved Silent Set Works

The vital element upon which depends the degree of accuracy with which lumber is made, aside from the condition of the saw, is in the setting mechanism. It must combine lasting accuracy, simplicity and durability, together with ease and rapidity in operation with a perfect adaption for setting any required thickness of lumber. Mowry's silent set works are different from any other make. They have many superior points, being strong, compact, and exceedingly accurate. No ratchets, no noise, positive grip and no lost motion are characteristics of them. Neither oil nor water will affect them. These set works have been tried in many mills and recommended by millmen. They are low in price and can be placed on any carriage.

The company are so confident that these set works will please that they will send them to any responsible party on thirty days trial and assume the responsibility. Enquiries should be addressed to Mowry & Sons, Gravenhurst, Ont., and should contain a statement that their advertisement was noticed in the Canada Lumberman.



Mowry & Sons Improved Silent Set Works

Horses for the Lumber Camps

The Union Stock Yards of Toronto, Limited, located at Keele street, West Toronto, are the largest shippers of horses in Toronto, specializing in lumber horses as well as heavy draught horses. This firm started business in West Toronto in 1908 and every year since has shown a steady increase. During the past season they supplied horses to many of the largest lumber camps in Ontario. Their barn

Horses for Lumber Camps—Union Stock Yards, Toronto.

system, which is up to date in every way and has stabling accommodation for over 300 horses, is under government inspection. There is also a track for exercising horses while on the company's premises. Owing to their splendid rail facilities, being on the lines of the G. T. R., C. P. R. and C. N. R., they are in a position to ship horses at an hour's notice and are specially prepared this season to take care of the camp trade. J. H. Ashcroft, Jr., is the general manager and W. W. Sutherland, assistant manager.

The River Drivers' Visit to Toronto

By William Henderson.

Bob had come into the office to buy a plug of tobacco and he and Archie, the foreman, were comparing notes of former experiences.

"Do you remember the time we were on the drive, passing through Bracebridge?" said Bob, "when, after we had a horn or two, we went into a milliner's shop and bought all the stock of ladies' bonnets she had and wore them all day?"

"Remember," replied the other, "will I ever forget?—and we kept them to wear the rest of the drive. Wasn't it the darndest looking sight, to see fellows riding logs with those big flowery things on their heads the rest of the summer?"

"That reminds me," continued Archie, "of one time when we were driving into Huntsville and decided before we got there, that we would make our hats all the same shape. Every fellow had to soak his hat in boiling water, then take a stick and turn it straight up, like a sugar loaf, into a sharp peak. Some of them had quite good hats, but they all had to go the same way, and when we got to Huntsville, we marched through the town two and two, wearing those hats."

The above conversation gives a meagre suggestion of some of the pranks the lumberjack will play when the spirit is "upon" him, or in some cases "in" him.

The same Bob and Archie have seen many a queer proceeding through, and are still game for a turn of devilment when the occasion is ripe.

"Did I ever tell you," said Bob to his companion, a few minutes after the above conversation, "of the time Jack and I went to Toronto?"

"No? Well, this was the way of it, and you can believe me or not, but there's no hot air in this."

"We decided that when the drive was over we would visit Toronto and see the city. First of all we went to Orillia, to get a good outfit. This was before local option had struck the town, and by the time our clothes were ready we hadn't the price, so we gave up the idea that year.

"Next year we talked it over again and decided that this time we would get to Toronto first and buy our outfit after; so, as soon as we got the drive to Byng Inlet; we took the boat to Midland, just as we were, and then the train to Toronto.

"I had the usual flannel shirt, wide open at the throat, a pair of short Mackinaw pants, that I had been wearing all winter. The pants had worn so, that there was a fringe about an inch long below each knee and every seam had bust out, but I had nothing else, so I sewed 'em up with white thread in a dandy herring bone stitch, and they made a fancy show, for sure.

"As soon as we got to Toronto, we went to one of those big tailor shops, where they make a suit for you in a day, and we ordered our clothes to be ready next morning. Then we went out to see the town, just as we were. When we walked up Yonge street, you should have seen the people get out of our road and turn round to look at us, as much as to say, 'Where did those wild beasts come from?'

"That night, about eleven o'clock, I lost Jack and was trying to find my way to the hotel. I noticed a lighted store window, with a lot of fancy ties and things in it, all marked with prices. I was pretty shaky on my pins but stood to look at these things, and began talking to myself, pointing to one thing and another and saying what I would buy next day.

"I had been doing this for a few minutes when some one touched me on the shoulder. Looking around I saw it was a lad in blue clothes, so I says to him: 'What is it you want.' 'Oh,' says he, 'just to take you where you can get a good bed for the night.' 'I'm on,' says I, 'that's just what I'm looking for,' and off we started.

"When we got to the building it looked kind of funny to me. 'This is a queer looking hotel you are taking me to,' says I. 'It's all right, mate,' says he, "So in we walked.

"When we got in there was another lad in blue sitting at a desk, and he says, 'What's the charge?'

"This brought me to my senses, and when the fellow who had shown me in says, 'Vagrancy,' I spoke up and says 'What do you call that?' The man at the desk says, 'It means that a man hasn't the price for board for the night.'

"'Oh, that's it, it is?' says I, and reaching one hand into a pocket of my pants, I took out a handful of silver, 'Don't you think there is enough there to pay one night's board?' says I. Then I put my other hand into the other side pocket, and drawing out a roll of bills, I says, 'May be this will be enough. If it isn't, I have more,' and rolling down my socks I took out my wad of big bills to show him. I had my whole season's stake on me.

"'Where did you get all that money?' says the fellow at the desk.

"'I worked for it, and just got paid this morning,' I replied.

"Turning to the turnkey then he says; 'you had better put this man in a cell till morning and we'll take charge of his money.'

"'No you won't,' says I, 'or I'll charge you with false arrest,' so they let me go and I went to the hotel.

"Next morning we got our new clothes, went to the barber's for a bath and a hair cut.

"That night I took Jack to where I met the cop. After passing him two or three times without being recognized I stopped and asked him:

"'Have you been arresting any more vags. lately?'

"Say, you ought 'ave seen his face!"

At one of the sessions of the Pacific Logging Congress, held recently in Tacoma, Wash., it was natural that there should be an interesting display of Simonds Crescent Ground Cross-cut Saws. The accompanying illustration gives a general idea of the exhibit. Simonds saws have been very popular on the coast as they are exceptionally effective in cutting large timbers.

Mr. D. H. Clarke, who has been connected with the timber agencies' department of the government land office in Edmonton for several years, has resigned and will go to Winnipeg as assistant to E. F. Stevenson, inspector of crown timber agencies.

WANTED & FOR SALE DEPARTMENT

PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line ($2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

WANTED—LUMBER, ETC.

WANTED—A quantity of 4/4-in. Ontario Plain Red Oak, vicinity of Georgian Bay preferred. Apply Box 535, Canada Lumberman, Toronto, Ont. 14-17

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co., Ltd., Toronto, Ont. 7-tf

Slabs and Cord Wood Wanted

Am open to buy any quantity up to 10,000 cords hard and soft wood slabs and cordwood. Write me. Horace Hartley, 19 ayor Street, Montreal. 15-19

Lumber Wanted

White Pine and Basswood Slabs wanted; from this season's cut; must be bright and of good thickness. Write stating how many cords you have, what you want for it on cars your station, and how much is ready to ship now. The Wm. Cane & Sons Co., Ltd., Newmarket, Ont., Canada. 17-19

Trimmer Ends Wanted

Price and freight rate permitting we will contract to take your White Pine Trimmer Ends, rotten pieces thrown out, fresh stock and not colored. Write price per cord on car and state shipping point.

The Wm. Cane & Sons Company, Ltd.,
11-17 Newmarket, Ont.

Birch Wanted

Want 200 M. ft. 10/4 1st and 2nds and No. 1 Common Birch. Give average widths and lengths and percentage of 14 and 16 ft. lengths. Want price delivered Philadelphia, Pa. and New York City.

Want 200 M. ft. 6/4 No. 1 Common Birch delivered Boston, Mass.

Want 5 cars 4½ in. and 5 in. 1sts and 2nds. Birch delivered New York City and Philadelphia, Pa. Reply Box 526 Canada Lumberman, Toronto, Ont. 14 T.F.

FOR SALE—LUMBER, ETC.

For Sale

100 M. ft. 2-in. Cull Spruce. 300 M. ft. 1-in. Cull Spruce. 15 M. ft. 1¼-in. M. C. White Pine. 50 M. ft. 2-in. M. C. White Pine. Fred T. Smith, 310 Board of Trade Bldg., Montreal, Que. 1.t.f.

For Sale

25,000 ft. 2-inch [illegible]
40,000 ft. 1½-inch [illegible]
All No. 2 Common [illegible]
Can ship promptly
J. H. DIRSTEIN,
17-18 Elmwood, Ont

Lumber For Sale

4 cars 1-in. good cedar for boat building.
100,000 ft. 2 x 6 mill run hemlock.
100,000 ft. 2 x 8 mill run hemlock.
4 cars 2-in. white oak, sound and square edge. Apply to Geo. C. Goodfellow
C Montreal, Que.

For Sale

500,000 feet Band Sawn Birch 4/4, 5/4 and 8/4 in shipping condition, rail or water shipment The Rathbun ompany, Descronto, Ont. 14-17

For Sale

For quick shipment, 100 M. ft. 2-in. Birch, December, 1911, cut. No. 2 C. & B. at $20 per M. on cars. Farm Point, Que. Hall Bros., 174 Mutual Street, Toronto, Ont. 16t.f.

For Sale

For quick shipment, 800,000 ft. Birch. All grades and thicknesses.

200,000 ft. Soft Elm M. R. All thicknesses.
100,000 ft. Basswood M. R. inch.
100,000 ft. Maple. All grades and thicknesses.

Send us enquiries. The Meaford Lumber Company. 7-20

FOR SALE—MACHINERY, ETC.

Cowan double surfacer, pipe bender, rope drive, ribsaw, one fifteen horse motor D. C. one twenty-five horse generator D.C. Apply Gold Medal Furniture Manufacturing Company, Toronto. 15-17

For Sale

Large three band sawmill complete, blacksmith shop, docks and trams, located at Ford River, Mich. Will sell at a bargain. Address I. Stephenson Co., Trustees, Wells, Mich. 17-19

Machinery For Sale

A Waterous No. 4 Band Saw Mill, with Carriage Saws, Live Rolls, and complete Filing Room equipment, also several Good Woodworking Machines, in splendid condition.

J. S. FINDLAY,
2-TF Owen Sound, Ont.

For Sale

Sawmill, in good condition, on Burford Lake, six miles from Wiarton, equipped with 70 H. P. boiler, 60 H.P. engine, new carriage by Long Bros., Orillia, Ont., good trimmers and endless chain attachment for hauling logs out of water.

Terms, etc., apply Massey-Harris Company, Toronto. 4-T.F.

For Sale
Planing Mill and Lumber Yard

Lumber business consisting of an up-to-date planing mill and lumber yard for sale as a going concern earning good profits. Established thirty years. Permanent location and growing trade. Modern machinery and equipment. Thorough inspection of plant welcomed and full information as to past and present business and future prospects willingly given to interested parties. Reason for selling, owners wish to retire. Reply, Laird Bros., Dresden, Ont. 17

Machinery For Sale

Carver, 4 spindle, Rohlman.
Cut-off saw, railway.
Dovetailer, Boults.
Engines and boilers.
Jointer, chair seat, Jenkins.
Moulder, two side, 6-in. Smith.
Moulder, three side, 6-in. Smith.
Moulder, four side, 6-in. Houston.
Moulder, four side, 9-in. Fay.
Moulder, four side, 12-in. Woods, inside.
Mortiser, Smith.
Mortiser, Bit.
Planer, 2-in. Gem.
Planer and matcher, 9 in. x 6 in. Berlin.
Resaw, band, American, 48-in. wheel.
Resaw, 42-in. circular.
Ripsaw, band, 42-in. wheel.
Sander, 24-in. Perry, power, two drums.
Saw gummer, Rogers.
Sawmill, band, 63-in. wheel, carriage, 18 ft.
Shaper, home made, wood frame, two spindle.
Shaper, iron frame, wood table, two spindle, light.
Shaper, iron frame, wood table, two spindle, heavy.
Swing saws, 6 ft.

O. L. Packard Machinery Co.,
Milwaukee, Wis.

Logging Equipment For Sale

100 Russell logging cars, complete with all chains, brakes, etc., in strictly first class condition at exceptionally low price. Full outfit of logging equipment, horses, harness, sleighs, chains, tools, blankets and camp outfit, all at a small fraction of its value. Write for prices and full description to Yawkey-Bissell Lumber Co., Arbor Vitae, Wis. 14-17

WANTED—EMPLOYMENT

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

Situation wanted, as office or general man. Sixteen years' experience in lumber. Good references. Box 561, Canada Lumberman, Toronto, Ont. 17-18

WANTED—Position by young man as sawmill office manager or shipper. Ten years' experience with largest hemlock concern in East. References A.1. Address Box 560, Canada Lumberman & Woodworker, Toronto, Ont. 17-20

WANTED—Position as Manager of lumber operations—stump to market—experience in White Mountain (New Hampshire), spruce, hemlock, hardwoods. Logging, railroading, manufacturing lumber, box shooks, and spools. Reply Box 539, Canada Lumberman, Toronto, Ont. 17

Position wanted as Assistant Manager, Sales Engineer or Chief Draughtsman by engineer with varied experience in boiler and steel plate work, steam and water power plants and general machinery. Successful record, best references. Address Box 557, Canada Lumberman, Toronto, Ont. 17

Manager and Salesman

Would like to correspond with large first class Hardwood Manufacturers unrepresented in New York territory, who would open office here. Years of experience in all lines of hardwood trade. Well known and draw large business. Employed now and could hold open for 1913. Married; good salary wanted. Box 565, Canada Lumberman, Toronto, Ont. 17

WANTED—EMPLOYEES

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

WANTED—A manager for retail lumber business in Alberta. Apply Box 558, Canada Lumberman, Toronto, Ont. 17

WANTED — General Superintendent for Sash and Door Factory and General Planing Mill. One who understands Plans, Cost, Estimate and having good control with men. Good position to the right man. Address Box 552, Canada Lumberman, Toronto, Ont. 16-17

Wanted

A first-class man to take charge of a well equipped Planing Mill, and Sash and Door Factory. Only a man capable of estimating and drafting need apply. References will be required. First-class salary to right man. Reply to Box 497, Renfrew, Ont. 17-19

WANTED—Manager for lumber business in Western Canada, cutting from three to four million feet of spruce per season. Must be competent and of undoubted integrity. One with a knowledge of driving logs and able to invest five thousand dollars or more preferred. Apply Box 559, Canada Lumberman, Toronto, Ont. 17

Reporter

We want an energetic representative in each town in Canada to report on building and engineering work—to tell us where machinery, equipment, supplies or materials may be sold. Reports are paid for on the per item basis. It depends upon your own efforts how much you make. This is a profitable side line and there is good money in it for a hustler. Write to MacLean Daily Reports Limited, 220 King Street West, Toronto.

WANTED—Assistant bookkeeper for lumbering office. Good wages for right man, capable of handling set of books. Address P. O. Box 162, Three Rivers, Que. 17

BUSINESS OPPORTUNITIES

For Sale

Timber limit, comprising 18 sq. miles, containing 25,000,000 feet mixed timber. Apply Geo. S. Nesbitt, Rupert, Que. 16-19

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

For Sale — Sawmill with Capacity

Of one hundred thousand feet per day. Located in Everett, Wash. Good rail and water shipping facilities. Ten and one-half acres of land with excellent mill pond. Price less than one-third of appraised valuation. 15-18

Address, P. GARDINER, Everett, Wash.

For Sale

Established Lumber Business, with first-class mill, now running full time. Timber limits with 20 to 30 million feet of standing pine timber conveniently located, and all merchandise, etc. Price $55,000. This is worthy of investigation. Address Box 332, Canada Lumberman, Toronto, Ont. 19-22-t.f.

Timber For Sale

Tenders will be received up to and including the first day of October, 1912, for the right to cut white and red pine and spruce, on two timber berths on the upper waters of the Jocko River east of the townships of Garrow and Lockhart, in the District of Nipissing, Province of Ontario, the berths being designated "Jocko No. 1" and "Jocko No. 2," each containing twenty-five square miles more or less.

For maps and conditions of sale apply to the undersigned.

W. H. HEARST,
Minister of Lands, Forests and Mines.
Toronto, July 17th, 1912. 15-18

Important Sale of
Valuable Timber Limits

Sealed tenders will be received by the undersigned up to and including the **20th day of December, 1912**, for the purchase of:

Limit No. 194 of 1873-74—River Jean de Terre—tributary to the Gatineau, containing an area of fifty (50) square miles, more or less.

Limit No. 195 of 1873-74—River Jean de Terre—tributary to the Gatineau—Island Lake, containing an area of fifty (50) square miles, more or less.

These limits comprise some of the best pine and pulpwood areas in the Province of Quebec.

Map showing location of these timber limits and report thereon may be inspected at the offices of the undersigned and from whom further information may be obtained.

The highest or any tender not necessarily accepted, and the acceptance of any tender will be subject to the approval of the Court.

The Toronto General Trusts Corporation,
30 Sigin Street, Ottawa, Ont.
or
Messrs. Aylen & Duclos, Barristers,
Castle Building, Ottawa, Ont.
or
Messrs. Belcourt & Ritchie, Barristers,

Dated Ottawa, August 5th, 1912. 16-20

WANTED—To hear from Box Mills in position to furnish boxes in car loads. Apply to Geo. B. Breon, Williamsport, Pa. 17-20

FOR SALE- A farm, sawmill and timbered lands, also a quantity of choice clear soft pine plank sidings. Apply to Hugh Cameron, Canonto P. O., Ont. 17-18

For Sale

Retail Lumber Business, situated in central position, Calgary, Alta. Premises for sale or on lease. Stock at wholesale price; easy terms. Apply Wattsburg Lumber Co., Ltd., Wattsburg, B.C. 16 & 17

The Standardization of Saw Teeth

Many operators and manufacturers in this decade are unduly concerning themselves with what they are pleased to designate the "standardization" of saw teeth. writes A. W., in the Timber Trades Review. In connection with the size, shape and selection of all saw teeth (band, frame and circular), considerable difference of opinion exists even amongst those who are regarded as practical and efficient men. That there is a wrong shape and a right is perfectly true; improper and proper space and angles likewise true. However, it is impossible to observe any hard and fast rule in this matter, and it is quite practicable and feasible that considerably wide margin should be given. In other words, it is impossible to invariably preserve space and length identically. A difference of ¼ or ⅜ in. in the space of log band saws, say from 1⅜ to 1¾ in., should not damage the capabilities of the teeth in the slightest; correct angles are of much more importance than space.

There are many reasons why saws may not perform their work efficiently or accurately independent of the tooth question entirely, and it should be accepted and understood that a saw (especially log band or circular) which will produce good work while cutting hardwood will produce equally good work while converting softwood. I venture to assert that (not including the vertical log frame) all this talk of having one type of teeth for hardwood and another for softwood is to a considerable degree unnecessary, for so long as special hardwoods are not in question the shape and space of teeth should not be altered, consequently the institution or introduction of so-called "standardization" would simply make matters worse instead of better, for, not taking into account the increased number of saws which would be required for each machine, saw makers and trimmers would be subjected to the additional disadvantages of having to alter the dies and punches of their fly presses, and a great deal more time would be expended on the necessary adjustment of the grinding machine which numerous varied forms and angles of saw teeth would entail.

As previously stated, there are many reasons besides the teeth for a saw not performing its work satisfactorily. Feed speed and guiding are two important features in connection with sawing. In many cases defective feed speed and guiding is not discerned by the operator, who generally thinks that when indifferent work is being produced the fault is attributed to the form, space and angles of his saw teeth in relation to the kind of wood being sawn. From such sources, I may safely assume (in most instances, at least), do the cry of the "standardization" of saw teeth spring. So far as circular saws are concerned, "standardization" of teeth could not be practically observed. With these saws the distance of space between points is diminished as the saw wears down. Thus for a 42-in. saw the space may be 2½ or 3 in., but as the saw decreases in diameter, say, to 30 in., the space is lessened to 1¾ or 2 in. So in the face of these mechanical conditions complete or beneficial standardization is impossible; besides, it is unnecessary, for the circular saw which will cut softwood rapidly and well will also cut hardwood equally so, all the difference being that a slower feed must be applied to the latter than the former.

Woodworking Speeds

"A. T. G." writes: "Can you tell me if there is any rule when calculating the speeds of driving woodworking machinery as to what is the usual allowance made for the slip of the belt? I recently tried with a speed indicator a circular saw bench and a vertical spindle sharpener both in and out of the cut, and was surprised to find a variation of over 30 per cent. in the speed. I presume the speeds given in makers' catalogues are those at which the cutting tools should run at when in full work, and if they are not maintained a large loss may be constantly going on undetected."

Undoubtedly, says the Timber Trades Journal, all tools should be kept up to their full standard speed when in full work, and we think if other users besides yourself tested their machines in a similar manner many would be equally surprised. The question of keeping all machines up to their standard speeds is a highly important one, but we fear it is one that is often considerably neglected.

As regards the allowance for belt slip when calculating out speeds, we know of no fixed rule, as the amount of slip would largely depend on (1) the driving centres; (2) the width, quality, speed and condition of belt; (3) the size of driving and driven pulleys, etc. Supposing the centres are correct, the belt of ample power, and the other conditions normal, an allowance of 10 to 15 per cent. for slip should be quite sufficient. We need hardly say that narrow, over-strained belts are the most frequent cause of slip, and their use is the reverse of economical. The same remark holds good where pulleys of insufficient diameter and width are used for transmitting power.

Uses for Sawdust

Flour for trade purposes from sawdust is now in common use. it is an ingredient of dynamite, linoleum, xyolite, etc. The wood flour is ground in a mill, very similar to those which grind corn and rye. Pine and spruce sawdust is used and after passing through the stones and the bolting chest, it is sacked or baled for shipment. It is then worth 48s. to 52s. a ton. The flour has a number of uses. It is the absorbent for nitro-glycerine, which is the explosive ingredient. Wood flour dynamite is inferior to that made with infusorial earth as the absorbent; but it serves many purposes and is cheaper. But dynamite is one of the smallest prospective uses for the product. Linoleum makers mix it with linseed oil and give body to their floor coverings. It is not considered quite equal to ground cork for this purpose, as it is less elastic, but it is cheaper and meets requirements for medium grades. The flour fills an important place in the manufacture of xyolite, a kind of artificial flooring, resembling wood in weight, and stone in other respects. It is used for kitchen floors, and in halls, corridors, cafes, restaurants, and public rooms. It is impervious to water, and is practically fireproof. It is floor material in some of the German war vessels. It is so used because it is not liable to take fire or splinter if struck by shells.

There should be practically no allowance made for belt slip on any saw mill machine. All belts should run without any slip, and if slip arises in any form it is a sure sign that there is something wrong somewhere, and it is for the operator to discover or locate this defect. It may be in the tension of belt, diameter or width of pulleys, in working with blunt tools, and many other reasons. However, so far as I can glean, the variation in revolving speed in this case cannot be attributed to belt slip, but to inadequate motive power. Many engines and motors will not maintain a uniform speed while running under load as when running light, but a difference of 20 or 30 per cent. should never exist. With well-governed engines the variation of speed should not in any case exceed 5 per cent. In other words, an engine having a normal speed of 100 revolutions per minute while running light should not decrease more than to the limit of 95 revolutions while under load. All modern motors, engines and machinery are of such efficient construction that difference of speed is not perceptible irrespective of load, so the writer who tells of the variation of speeds which he encounters clearly shows that the conditions under which he works are out of date.—A. M. in Timber Trades Journal.

"Screeching" Driving Belts

It is not an unusual sound in a saw mill to hear driving belts screeching, and as this means loss of power and damage to belts the cause should always be at once sought out and remedied. Supposing the belts are of sufficient width to easily transmit the power and are not too tight, the most frequent cause of screeching arises from the driving and driven pulleys not being dead true with one another, and this causes the belt to run spirally, stretching it unevenly and reducing the arc of contact or driving power between the belt and the pulley faces. Again, belts are often allowed to rub on part of the face of a tight pulley when standing or against its edges or the stationary bars of striking gear; consequently they become unduly stretched on their edges, and their driving power is reduced in proportion, as complete contact does not then take place.

What J. D. Shier says about the Barkey Lumber Register

Barkey Bros., Stouffville, Ont.
Dear Sirs,
Yours to hand and noted. We have been using one of the George Lumber Registers for some years past and find it still working well. It gives very accurate measurements and have never known it to make a mistake. When in need of another we will certainly get one of the same kind.
We remain respectfully yours,
Feb. 5, 1908. J. D. SHIER, Orillia, Ont.

Can be used on any moulding or matching machine.
Ensures absolute accuracy and saves one man measuring.
Sent on 30 days' trial, return at our expense if not satisfactory

Martin Freres Co., Montreal, Que., 4 ft. machine, boxes

CANADIAN LINDERMAN

MUSKEGON, MICH. Works

matic Dovetail Glue Jointers

WHAT are they making:—

BOXES:—Converting narrow width lumber, shorts and short shorts into wide stock for one piece ends, sides, tops and bottoms, effecting a saving in the original purchase of their lumber from $2.00 to $10.00 per thousand, actual figures given after testing out the machine, securing results in the finished product never before possible.

BANK, OFFICE AND STORE FIXTURES:—Interior finish; cores for veneered doors; casing; base boards, etc.

CORE WORK for interior of cars; joining up solid panels, etc., for sleepers, diners and coaches.

WIDE PANELS for washing machines from narrow widths so as to make tight water joints where before wide lumber was necessary.

HEADING for candy pails, lard tubs and wooden buckets of all descriptions, utilizing the narrow widths of stock 1″ and upwards, 7″ long and upwards.

FURNITURE:—Solid Quartered Oak Matched tops, Mahogany, Plain Oak, Maple, obtaining better joints than ever before possible: making drawer sides and bottoms; back panels; chair seats; cores for veneered stock; etc.

In fact there are 1911 model Linderman Dovetailers working to-day in Canada on practically every different kind of work requiring wide stock, and all machines are doing the work better, far cheaper and more satisfactorily than is possible by any other method.

Tell us your conditions and we will outline the results

Review of Current Trade Conditions

Ontario

Trade conditions in the lumber business throughout Ontario continue on a very satisfactory basis. The great amount of building operations in progress are causing a widespread demand for all classes of lumber. Spruce in particular is in excellent demand. Travellers report that they have never known so good a demand for spruce since the spring of 1907. The best demand is for spruce flooring and siding. White pine laths are very strong. New Brunswick shingles are in good demand throughout Eastern Ontario. Extras are selling at from $3.40 to $3.55 and clears at $3.15 to $3.30 delivered at Toronto. Second clears are bringing from $2.25 to $2.30. The demand for hemlock continues remarkably strong, dry stock has disappeared from the market and there is a good demand for the new cut in all sizes. New cut of hemlock has been on the market since the middle of July. The reduction in the quantity of hemlock taken out last winter and the improvement in the demand have resulted in all classes of hemlock being bought up almost from the saw. Inquiries for hemlock are much greater than the supply in the standard lengths. The fact of the matter is that with the opening of the spring trade there was very little hemlock. In fact it is difficult to say where stock will be secured. Manufacturers this year cut their logs to the long lengths, 10 ft., 16 ft. and 18 ft., consequently their is a great shortage of 12 and 14 ft. lengths and presumably no possible chance of replenishing these sizes before the mills start on another season's cut. Prices are very firm with a strong tendency to advance. Twelve ft. hemlock is worth now as much as 16 ft. was worth recently, namely, about $18 per thousand. Hemlock stock boards are very scarce. A shortage is developing in No. 1 and No. 2 mill cull pine. White pine 1-in. x 4-in. and 5-in. is growing scarce.

B. C. shingles are strong and dealers who do not put in their orders for fall trade at an early date will probably be disappointed, because every indication points to a great shortage of cars on account of the movement of grain.

Eastern Canada

The lumber trade at Montreal continues very brisk, offering an excellent outlook for the fall business. Practically every branch is enjoying an active demand and several important lines of lumber are growing scarce. Prices all along the line are firm, while shingles, clapboards and railway ties are moving rapidly. The old complaint of shortage of cars continues and the trade is suffering considerably on this account. Exports to the Old Country are large and prices continue strong. There is a good demand for news print paper and some improvement is reported in the ground wood situation. The shortage of water in the Eastern States again threatens to reduce stocks of ground wood and the approaching election campaign promises to produce an exceptionally heavy demand for paper. Sulphite is particularly scarce and prices are strong with an indication that they will continue so for some time to come.

Reports from Boston indicate a fairly good trade, although there is some hesitation, as is usual at this time of year. A few sales of eastern spruce have been reported of late at lower prices than formerly. For frames, most of the business is going at $24.50, although some manufacturers are holding out the $25. Random is moving steadily and prices are unchanged. Hemlock at Boston is firmer and offerings of dry lumber are scarce. Eastern clipped boards are held at $22.50 and a few lots at $23. The shingle business at Boston is about steady and prices are unchanged. Cedar extras are held at $3.90 to $4 and clears at $3.60 to $3.65. Lath are a little firmer. For 1⅝-in. the price asked is from $4.10 to $4.15 and for 1½-in. from $3.65 to $3.75.

At New York the business in eastern spruce is about normal. Dry spruce boards are almost out of the market and random stock is firm. Hemlock is strong with an upward tendency. Many sizes are scarce, particularly boards.

Strong prices continue for all grades of New Brunswick spruce and an upward tendency is reported from St. John for all classes of wood goods. The English market is particularly strong, although the continued high rate of freights is still acting as a drawback to trade. This is also noticeable in connection with coastwise trade shipments. London steamers are still asking 45s. per standard and space is limited. The fact that many of the St. John and interior mills are sawing more extensively than usual for United States markets will reduce stocks of English deals for liner shipments from St. John. It is just possible that this may have an effect in the direction of reducing freight rates to the Old Country. Most stocks of deals throughout the province are reported to have been sold. North Shore freight rates are around 57s. to 58s. and vessels are scarce.

Recent sales of deals on sellers' wharves have been made at about the following prices: $15 for a specification of 50 per cent. 7-in. and 8-in. x 3-in., balance 9-in. and up; $13 for 3-in. x 4-in. and 3-in. x 5-in.; $13.50 for 3-in. x 6-in.; $11 for deal ends and $13 for fourth quality.

American prices remain firm at from $22.50 to $25 for random, according to the percentage of 2-in. x 8-in. and up and 20 ft. and up lengths, for New York and Sound ports delivery. Coastwise prices are about $4 on long lumber and 80c per M. on lath, New York delivery. The indications for the Fall and Winter trade are excellent, improvement being particularly noticeable in the English market.

Local trade at St. John is good, with refuse boards, scantling and deals bringing $9 on the yards at the mills. Hemlock boards are scarce and are worth about $14 planed on yards, hemlock logs are scarce. Laths are selling well and stocks are low at the mills, the price being about $2.70 f.o.b. sellers' wharves.

Great Britain

Trade conditions throughout the United Kingdom have shown remarkable improvement during the months of July and August and the lumber trade has enjoyed the betterment as much as any other. An idea of the general trade situation may be obtained from the fact that exports during July, 1912, amounted in value to £42,000,000, whereas during July, 1911, which contained an extra working day, the exports were valued at only £34,500,000. In 1910 the total for July was £38,000,000. An important feature of the statistics is that in spite of all the troubles of the present season—the lock-out in the cotton trade, the protracted coal strike, and the several labor troubles in the port of London—the trade of the country for the seven months up to the end of July shows an increase of over £9,000,000, as compared with last year, or about 3½ per cent. If the comparison is made with 1910, the increase is much greater, being £24,000,000, or at least 10 per cent.

Some improvement is noted in the London timber trade, although the effects of the strike are still noticeable at the docks. Quays are still loaded with cargoes from the last of the spring fleet. The fresh arrivals, however, are not numerous, and this situation is expected to disappear gradually. Steamers are still hard to secure, even at the present high rate of freights. Values are increasing gradually. There is a steady demand, especially for the export trade. Deliveries at the London docks for the week ending August 10th amounted to 5,927 standards. Last year there were nil during the corresponding week, on account of the strike.

Holidays have been interfering considerably with Liverpool trade of late. In spite of this, however, a fair volume of business has been in progress in all branches of the whitewood trade. Country buyers have apparently decided that they must pay the prices which they refused a few months ago. No change is reported in regard to spruce deals. Ocean freights from St. John, Miramichi and other New Brunswick ports are still high and steamers are difficult to secure. Importers at present are not able to make much profit as the country consumer has not yet come to realize that freight rates are high and marine insurance expensive. Stocks of spruce deals at New Brunswick and Nova Scotia ports are reported to be only moderate in extent and the demand from the United States is interfering with shipments to the Old Country.

For an ordinary specification of, say, 70 per cent. of 3 x 7 and 3 x 8, balance various sizes, for good sized steamers to west of England ports, high prices prevail. The market for Canadian pine deals is unchanged.

At Manchester, bad weather has had a depressing effect upon trade. Spruce deals are firm and there is a great scarcity in practically all sizes of any lengths over 16 and 17 feet. Short average cargoes have been the rule this year, resulting in an apparent great demand for log deals and scantling. Floorings have been selling at £10 2s 6d, c.i.f., although some shippers are holding out for £10 5s. Slating battens are very scarce. The lowest price is £8 10s c.i.f. Arrivals of pine sidings have been numerous but there have not been enough of the first quality. Values are very firm, even 1-in. and 4-in. to 6-in. being valued at £25 to £26 per standard, ex quay.

United States

The lumber trade in the United States continues to enjoy almost uniform activity. A pronounced increase in the demand is noticeable for September trade. The only difficulty in sight is the annual shortage of transportation facilities, as it is believed that the impending shortage of cars will be almost of a paralyzing nature. The scarcity of transportation facilities has in fact made itself felt already and reports are coming from all quarters that the crop of the present year will be of enormous proportions and that the process of carrying it to market will choke up every avenue of traffic.

Raft containing 6,000,000 feet towed from the Georgian Bay to our Mills Arrived in Sarnia on August 5th

BUY THE BEST

Retailers and woodworking establishments who like to get AI NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

How about PINE LATH? We have a fine dry stock of No. 1 4 ft. on hand for immediate delivery.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"RUSH ORDERS RUSHED"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

A. F. Holden, Pres. J. M. Diver, Vice Pres. and Gen'l. Mgr. E. C. Barre, Ass't. Mgr.

Chicago.—The trade in northern pine is steady and the indications of a good grain crop are assisting the lumber trade. Full prices are being secured by lumber manufacturers. Some of them, in fact, have advanced the prices on Nos. 4 and 5 white pine boards by $1 during the past month, and report that they have no trouble in getting rid of all their product at the advance. Retail yards are coming forward with a strong demand as they foresee good business during September and are anxious about securing shipments. Hardwoods are in good demand, particularly from the factories.

Interior furniture plants are enjoying a revival of business. Implement and wagon makers are asking for increased quantities of staple hardwoods. Dry stock in many cases is short. Plain red oak is moving quickly at good prices. There is a fair demand for quartered white oak. Hickory, birch and maple are all active, particularly in the lower grades. Basswood No. 2 and No. 3 are very strong and stocks are scarce. The market for hemlock continues strong with a greatly increased demand and stocks exceptionally scarce. The yellow pine trade is enjoying plentiful enquiries, particularly from the railroads, which are buying freely. Prices are stronger than they have been for several years. Red cedar shingles are advancing. The price is now 15c. higher than a week ago. Clears are selling at $3.57 and Stars at $3.14, Chicago basis. White cedar shingles are firm. Extras are bringing $3.20. There is a strong demand for lath and prices are firm.

Buffalo.—The northern pine trade during the month of August was heavier than was looked for, although a great deal more business could still be handled without difficulty. Box factories are rather quiet but are expected to start up within a few weeks. The hardwood trade is fairly active, the aggregate amount of business being about normal. Stocks in the yards are plentiful in most cases, although in some woods they are less than usual, on account of the difficulty in getting dry lumber. Prices are firm with a tendency in some cases to further strength, particularly in plain oak. Birch is in good demand. Orders for hemlock are plentiful and prices are being held firmly. The recent advance appears to have no disturbing effect upon trade and the indications are for continued strength. Arrivals of stock are in fair amount. Southern pine is continuing strong and shipments are coming along fairly regularly. Continued strength is expected during the next few weeks. Red cedar shingles are strong and several advances have taken place of late. Some grades are selling at 30c more than a few weeks ago, and the general market is from 15c to 20c higher. The receipts are fairly large but not sufficient to affect the firm prices.

Market Correspondence

Marked Improvement in New Brunswick Trade

St. John, N.B., Aug. 25. (Special correspondence of the Canada Lumberman): The markets for all grades of spruce remain firm. In fact the price of all wood goods seems to be tending upwards, especially in the English market. The only drawback being the high rate of freight asked by foreign and coastwise tonnage. The rate asked by London steamers still remains at 45 shillings and space is somewhat limited. Stocks of English deals for liner shipments from this port will not be as heavy as usual during the coming winter, as many of the mills in the interior and the city are sawing large quantities of spruce for United States markets. Therefore it is felt that, should the liners need cargo they will be forced to lower their rates. It is said that the larger proportion of deals throughout the province have been sold and shippers who have deals on the north shore of the province are making strong efforts to have them moved before winter sets in. The rate of freights from the north shore at present runs about 57 to 58 shillings and vessels are scarce.

A large quantity of deals have changed hands at private terms, but it is understood that the price was about $15 for a specification of 50 per cent. 7 and 8 x 3, balance 9 in. and up, with about $13 for 3 x 4 and 3 x 5; $13.50 or thereabouts for 6 x 3, with local ends at about $11 per M. and 4th quality $13, all deals being sold on sellers' wharves.

Prices in the American market still remain firm with random selling anywhere from $22.50 to $25 according to the percentages of 2 x 8 and up and 20 ft. and up lengths, delivered in New York or Sound ports. Freights are still high for coastwise shipments, no vessels being closed for less than $4 per M. on long lumber and 80c. per M. on laths for New York delivery. Taken all around the prospects for a good fall and winter trade are brighter than at any time during the year. Especially is this the case in the English market.

Local business is very brisk as all the factories and yards are well supplied with business and as there is quite a lot of heavy building in progress or under consideration. It is felt that in this line there will be no let up until snow comes. Refuse boards, scantlings and deals are selling for $9.00 on yards at mills. Order stocks from mills for local trade bring good prices.

Hemlock boards are scarce and are selling for about $14 planed, on yards. Hemlock logs are scarce and it is felt that the board market will remain very firm. The lath market is also in excellent condition, very few laths are being held on wharves at mills and what are, have been sold at about $2.70 f.o.b. sellers' wharves.

Shooks—The box trade in this section of country is very brisk, good prices being realized, but one must take into consideration that although prices are higher than last year, the manufacturers are paying a very much higher wage. Should there be a good run of fish on the coasts throughout the provinces of New Brunswick and Nova Scotia, the box mills will be kept with orders throughout the winter. At present writing the fishermen are meeting with good success.

Labor conditions are still very unsettled, and will probably continue so throughout the season. Mill men are finding it hard to man their mills to the full extent which means a shortage in the day's turnout. This seems to be the cry all over the province.

All logs on the St. John River have been driven to the booms by the last big rains, the water in the river at the present time being at freshet height. Many logs belonging to mills along the river above the boom limits have been swept away and carried into the booms, at a great loss to the owners as they will be forced to shut down their mills and sell their logs to parties here.

Active Trade at Montreal—Car Supply Short

Montreal, Aug. 26th.—(Special Correspondence of the Canada Lumberman).—In every direction one hears good reports of the lumber trade, and the outlook for the immediate present is very promising. All branches are participating in the excellent business, and some lines are very difficult to procure even at better prices than have been ruling lately. Quotations generally are firm, with shingles, clapboards and railway ties in active demand.

There are still complaints of the slow delivery of cars by the railways, and one company has put an embargo on receiving cars from another company, owing to the congested condition of the terminals. The Canadian Manufacturers' Association have asked shippers all over the country to expedite traffic as much as possible, as an exceptionally bad shortage in cars is expected in the fall, when the grain has to be moved.

Exports of lumber to Great Britain continue to be on a large scale, and prices are keeping up. Shippers would be better pleased if the cars came forward more promptly than they are.

News print mills have all they can do. The ground wood situation is improving, with the lowering of power streams in the paper-making districts of the Eastern States, and it is feared that there will not be sufficient ground wood in stock to be manufactured to take care of the extremely heavy requirements of the election campaign in the fall. Prices are $18 to $19 at the Canadian mill.

Sulphite is stronger than at the date of our last report, and now it is not so much a matter of price as of procuring the sulphite. This position will probably last for at least another year. One reason being that every country in the world is producing paper to its fullest capacity, thereby using the maximum quantity of chemical pulp. In addition very little new pulp has come on to the market during the past two years.

Brisk Business at the Tonawandas

The Tonawandas, N.Y., Aug. 22. (Special correspondence of the Canada Lumberman). The midsummer lull in the local lumber market is on the wane. Increased orders are reported and the fall rush of stock from upper lake ports has begun. From now until the season of navigation ends and snow and ice begin to tie up the yards, there will be activity in all lines of the local lumber industry. The election campaign isn't rippling even the surface of the lumber trade. Nobody seems to be worrying about who will be elected. It is taken for granted that all the bothering of big business has been done and that no matter who sits in the White House the next four years there will be plenty of prosperity. Salesmen who have felt the pulse of the buying public the last few weeks report a well grounded feeling of optimism for the outlook in building and in other lines that use lumber largely. There are few local dealers who are not looking forward to a resumption of prosperity. To show how strongly the Tonawandas are stocking up with lumber for a good time to come, it is only necessary to call attention to a fleet of boats scheduled to arrive here to-morrow with a total of 15,000,000 feet aboard. And this is only a part of one week's arrivals.

With the improvement in general business conditions has come a corresponding increase in prices. "I have seldom known so many inquiries to be afloat as during the last ten days," said a large local dealer to-day. "The market is decidedly strong all along the line.

Douglas Fir for Finish

is rapidly gaining favor in Eastern Canada. For years this beautiful wood has been used extensively in good work in the west but is now recognized in the east as a first class Material and is specified for the best work by Architects and Builders who think.

SASKATCHEWAN	Travelling Representative	H. Paterson
ALBERTA	" "	A. Montgomery

Shingles for instance are going simply out of sight. There has been an increase of nearly ten cents a day on shingles every day for the last ten days. A week ago I bought shingles in carload lots at $3.26 which I would have to pay $3.83 for to-day and the shingles are not a bit better quality. The demand is particularly strong on the better grades such as Clears and Star A's. The poorer grades are not yet affected. Hemlock is another item that is on the up-grade, as is also bevel siding. There is no sign of a break in the market."

Among the incorporations of interest locally is that of the Canadian-American Lumber & Pulp Company organized to deal in lumber and timber at Niagara Falls. The capital stock is $25,000 with the following directors: Mr. Uptegraff of Pittsburg, Pa.; James M. Uptegraff of New Brighton, Pa., and Thomas Uptegraff of Niagara Falls, N.Y. Business has already been begun at Niagara Falls.

Among the lumber concerns in the Tonawandas that are enlarging their plants is the R. H. Bennett Lumber Company of Main street. During the last six months, the plant has been doubled and buildings to the value of $50,000 have been erected. The Bennett Company took over the yard until recently occupied by the W. E. Kelsey Lumber Company on Main street. A large cement block stable was first erected to house the large number of mules which are used to cart lumber and building supplies from the Tonawandas to Buffalo. Later, a modern planing mill and moulding factory were built around the corner on Island street and at present a modern cement block dry kiln with a capacity of 40,000 feet is in course of construction.

Boston Lumber Trade Shows Good Volume

Boston, Mass., Aug. 23rd, 1912.

Editor Canada Lumberman:—

The general domestic market for lumber has improved. Prices have advanced a little and the volume of business has held well of late. The South American market has remained very dull until quite recently. It now shows some signs of recovery, as orders are being placed, and there is some inquiry.

While it would now seem quite likely that the Democratic party would be in power next year, and as it has always been our experience, judging from the past, that the business community is not particularly active and business is not very successful during the Democratic administration of the government, still, that outlook does not seem to have put any damper on the business during the summer or early spring.

While it would seem to the writer that a conservative course to pursue would be to go carefully for the next four or five months, it may be that the Democratic administration, if we have one, will be prosperous and that business will continue to expand. However, the writer feels that a due amount of caution should be exercised in making purchases for winter and spring consumption.

Yours truly,

SHEPARD & MORSE LUMBER COMPANY,
W. B. Shepard, President.

Steady Trade at Quebec

Quebec, Aug. 24. (Special correspondence of the Canada Lumberman): While the shipments of square timber and deals from this port to the old country are large there have been no recent sales of any consequence to report. In the outports, such as Matane, Riviere-du-Loup, Rimouski and Bersimis, there are quite a number of sailing vessels loading spruce deals and lumber for Buenos Ayres, Rosario, etc. Although freight rates are high, the demand for the above description of wood continues good in the ports above named.

Shipments of pulpwood and pulp from Quebec and outports continue to be very large, the United States being the chief market for the wood and some of the pulp, but the greater portion of the latter is being shipped to the United Kingdom.

At Stoneham, about twelve miles from this city new limits for pulpwood were opened last spring, and there are now about fifteen thousand cords cut there. This will be brought down to the river banks during the winter and be ready for shipment next spring.

Contracts are now being made for next year's supply of pulpwood. The demand is large, but prices are about the same as the present season, hand peeled being quoted at $7.50 per cord, and machine peeled at $9.25.

The large pulp mill which has been operation for some time at Jonquiere in the Saguenay district, has not not been able to supply the demand upon it. To meet this call, the Messrs. Price Bros. has erected another large mill in the vicinity and this will be in operation in a short time. The demand for lumber for building purposes in the local market is dull.

The Babbitt Metal Without a Fault

I'll Speak to It Tho' HELL
Itself Should Gape and Bid Me
Hold My Peace.—*"Hamlet"*

Determination is the key note in Hamlet's statement that he will speak to his father's ghost.

Determination was our key note when we set out to make a Babbitt Metal specially suitable for all woodworking machinery.

Determination and the result of over a quarter of a century's experience resulted in the production of

HARRIS HEAVY PRESSURE

THE BABBITT METAL WITHOUT A FAULT

We Recommend and Guarantee This as the Best Babbitt Metal for All General Machinery Bearings

WHY WE RECOMMEND

It is doubly copper hardened.
It will not crack or squeeze out.
It runs cool at any speed.
It positively eliminates friction.

The purest treasure mortal times afford is spotless reputation—*King Richard II.*

WHY WE GUARANTEE

All raw material carefully selected and tested for purity.
Manufactured under the supervision of a skilled metallurgist.

EDGINGS

Ontario

The Coyne Lumber Company, Schreiber, Ont., have secured a provincial charter.

Peck & Wills, manufacturers of sash and doors, Belleville, Ont., recently suffered loss by fire.

The Spence Lumber Company, Limited, Seguin Falls P.O., Ont., have obtained a provincial charter.

The McAulffe Davis Lumber Company, Duke street, Ottawa, have purchased eighty acres on Russell Road and will erect a large factory and cottages for the workmen.

The Superior Match Factory, Owen Sound, Ont., have awarded the contract for the foundation and brick work of their factory to James C. Grier, 685 Second avenue west.

The Canada Furniture Company, Walkerton, Ont., are considering plans for building a large addition to their present plant. They are likely to be in the market for new machinery.

The London and Petrolea Barrel Company, Simcoe street, London, Ont., are reported to be in the market for a large quantity of white oak and other lumber suitable for manufacturing barrels and kegs. Mr. John Foristal is manager of the company.

The Dominion Bond Company have purchased control of the Toronto Paper Manufacturing Company, of Cornwall, the Barber and other interests having sold their shares. It is intended to make a public issue of stock, and also to improve the property of the company.

The Haight and Dickson Lumber Company, Limited, have been incorporated with share capital of $40,000, to carry on a business as sawmill proprietors and timber merchants in the province of Ontario. Head office is to be at Sudbury. Provisional directors are Chas. McCrea, Geo. J. Valin, Mary D. Flanagan, Arthur J. Manley and John S. Nicholls.

The Toronto Paper Manufacturing Company, Limited, has been incorporated with a capital stock of $1,000,000, with head office at Toronto, to carry on the business of pulp and paper manufacturers and deal in articles of wood. The incorporators are: Alfred Bicknell, G. B. Strathy, H. B. McKitrick, W. H. Walter, J. F. McGregor, C. W. Morley and W. R. Anderson, all of Toronto.

The Peterboro Lubricator Company has recently been purchased by Mr. Roland Wilson, of the Peterboro Machine Company, who will conbine the two factories under the title of the Peterboro Machine & Lubricator Company. The "Philadelphia" compressed air grease cup which this firm manufactures, is becoming known from coast to coast and is especially adaptable for use in sawmills.

The Lake Superior Paper Company, Limited, of Sault Ste. Marie, Ont., one of the affiliated interests of the Algoma Steel Corporation, have this season started operations on a large scale. In December last they took over the mills and limits of the Algoma Commercial Company, located at the Soo, and are cutting this season 26,000,000 feet of spruce and white pine. It is the intention in the near future to erect another sawmill of a larger and newer type to run in conjunction with the present mill. Ninety thousand cords of pulpwood per season is the capacity of the pulp mill department and the paper mill has a capacity of 200 tons per day.

Hon. Adam Beck, of London, Ont., who controls woodworking factories in Montreal, Hamilton and London for the manufacture of veneer, thin lumber and boxes, is arranging to merge them into one company under the name of the Beck Manufacturing Company, with a capitalization of $500,000. Another plant will be erected in Toronto on the corner of Wilton avenue and River street, at a cost of $60,000. In organizing the new company the co-operative principle will be adopted. The heads of departments, the managers, and employees who have been for a number of years in the company's service, will be given stock and have an opportunity to add to their holdings from time to time.

Eastern Canada

Durham Bros.' sawmill at Campbell Settlement, N.B., was recently destroyed by fire.

Shearer, Brown & Wills, Limited, 225 St. Patrick street, Montreal, have commenced the erection of a planing mill to cost $2,500.

The sawmill of Harrison & Hicks, Dalhousie Junction, N.B., was recently destroyed by fire The loss will be about $6,000, with no insurance.

The Meyer Thomas Company's box factory at Granby, Quebec, was recently destroyed by fire, the loss amounting to $100,000. It is reported that the company will rebuild.

G. A. Grier & Sons, Limited, Montreal, have added a dimension timber department to their sales yard, and are now selling Canadian spruce, hemlock and Georgia pine in dimension timber.

The Dalhousie Lumber Company, Dalhousie, N.B., are reported to have bought out the Gaspe Lumber and Trading Company, and it is reported that they will make extensive alterations to the present plant.

The mill of the Newville Lumber Company, at Newville, Nova Scotia, was totally destroyed by fire on August 23rd, together with 150,000 feet of lumber and 1,000,000 lath. It is understood that the mill will not be rebuilt during the present year.

A brush and broom factory to cost $200,000 is being erected at Fairville, a suburb to St. John, N.B. The owners are T. S. Simms & Company, Limited,

the president being Mr. Louis Simms, Union street, St. John. The Aberthaw Construction Company are the contractors.

Thieves entered the office of the McLaurin Lumber Company at Lachine, Que., on August 24th, and blew open the company's safe, after binding and gagging the night watchman. Fortunately they were only able to secure $60. No clue to the thieves has ever been found.

Reports from Pokiok Falls, N.B., state that a ground wood pulp mill will probably be erected there in the near future as Dr. A. C. Haggarty and Dr. R. E. Haggarty, of Ellsworth and Sedgwick, Maine, have been increasing their holdings and investigating the proposition in detail.

The sawmill owned by the Sydney Lumber Company at Dalhousie, N.B., was destroyed by fire on August 21st. The loss being $20,000. The saw, shingle and stave mills were completely destroyed and will be rebuilt. The sawmill will be replaced first. The company is in the market for new machinery.

Six per cent. mortgage bonds of the Rolland Paper Company, Limited, Montreal, to the value of $500,000, have been offered to the public. The company recently acquired the property of the Northern Mills, Limited, and now have two modern equipped mills. The plant of the Northern Mills, Limited, is to be enlarged at a cost of $200,000.

It is reported from Grand Falls, N.B., that the Grand Falls Power Company, of which Sir William VanHorne is president, have taken over the rights and privileges of the two rival companies at that point and that they will establish, at Grand Falls on the St. John River, a pulp and paper making plant, at a cost of between $5,000,000 and $7,000,000.

The sawmill belonging to the Sydney Lumber Company, at Dalhousie, N.B., was destroyed by fire on August 18th. The flames were discovered shortly after the mill had been closed down at 12 o'clock at night. The property included a saw, shingle and stave mill. One hundred men were thrown out of employment. The plant will be rebuilt immediately.

A report from Bathurst, N.B., states that another move has been made in the direction of opening up the pulp industry at that point. Those who are interested in the water-rights on the Nepisiguit River, held a meeting recently with the promoters of the proposed pulp mill. After the meeting it was stated that arrangements had been made which were satisfactory to both parties.

The Dorwin Falls & Improvement Company, Limited, have been incorporated with capital stock of $250,000, with head office at Montreal, to develop, operate, sell or lease timber limits or water powers, and to carry on a lumbering business in all its branches. The incorporators are G. W. MacDougall, Lawrence MacFarlan, Gregor Barclay, R. E. Moyse, and Ara Armstrong, all of the city of Montreal.

Reports from Montreal state that one of the largest pulp and paper enterprises ever launched in Canada is being worked out by the Labrador Pulp and Power Company, involving an increase of the capitalization of the company from $3,000,000 to $15,000,000. The proposition includes the development of the falls on the Hamilton River, which are only second in power to those of Niagara, and the erection of two large mills, one at Hamilton Inlet, and the other at Sandwich Bay, the combined output of which would be 150,000 tons of paper per annum.

Western Canada

The Traders' Lumber Company, Vancouver, B.C., have secured a provincial charter.

The Beaver Lumber Company, Limited, of Holmfield, Man., have sold their business to John Henderson.

The North American Lumber and Supply Company have bought the lumber business of R. G. Fletcher, Asquith, Sask.

Fire recently destroyed the Grand and Mounce Sawmill at Cumberland, B.C., throwing three hundred men out of employment.

The Raymond Birnie Lumber Company, Limited, Calgary, Alta., have changed the style of their firm name to Birnie Lumber Company, Limited.

The Canadian Pacific Lumber Company have commenced operations upon their new plant at Alberni, B.C. The plant will have a capacity of 100,000 feet per day.

The Atlas Lumber Company, of Edmonton, is erecting a number of large closed-in sheds and barns and other equipment necessary to carrying on an extensive business.

The Robinson & Lequime Lumber Company, Limited, are applying to the British Columbia Legislature for permission to change their name to the Western Pine Company, Limited.

The mill of the United Lumber and Shingle Company, at Nanoose, B.C., will be completed and in operation by the middle of September. The capacity of the mill will be 140,000 feet per day.

A. E. Watts, of Wattsburg, B.C., has bought the Cranbrook Lumber Company's mill, and intends re-erecting the plant in the midst of the timber north of Wattsburg. He has made provision for the transport of the rough sawn lumber by flume.

The sash and door factory belonging to Hatch Brothers, Fifth avenue and Cedar street, Vancouver, B.C., was destroyed by fire on August 15th, together with a considerable amount of lumber. The loss was approximately $40,000, and was only partly covered by insurance.

A large number of men have lost their lives on the Fraser River, to date. These men, who are employed at the different transcontinental railway camps, endeavor to float down the Fraser on log rafts. The violence of the current of the river breaks the raft however, and the men are swept away.

Word has been received in Edmonton that A. J. Carlson, an American, with large interests in the Dakotas and Nebraska, has acquired twenty wooden bridges and trestles, containing about 6,000,000 feet of timber on the canadian Pacific Railway Company's St. Mary's route to Macleod, Alta., abandoned in 1908, and will cut this into lumber. A sawmill will be erected near Lethbridge and thirty men employed. Mr. Carlson will also get about three hundred tons of iron out of the bridges.

Stickermen's Extension Rule

Will Reduce Efforts, and Adds to Efficiency

Adjustable. Reversible. Transformative. Made of Steel.

Gentlemen: MILWAUKEE, March 13, 1912

We beg to acknowledge receipt of the two rules sent us on March 8th. We are very glad to state that we find these rules very useful and an economical aid in setting of sticker knives, in fact, our sticker man would be at a loss to get along without one.

Thanking you for your promptness, we are,

Yours very truly,

MATTHEWS BROS. MANUFACTURING CO.

IT'S many filers of many minds when it comes to Saw Gumming Methods—but it's many filers of one mind in considering wheels—they all agree that the fastest, cleanest, coolest, cutting wheel is the

Aloxite Saw Gummer

You can force the Aloxite Wheel to the limit—yet it will cut without burning or case hardening the saw. It will hold its shape—cut quietly—no rasping or screeching—just free and easy grinding — aloxite is hard, sharp, tough—the best of all the steel cutting abrasives—

May We Send You a Trial Wheel to show you the way to better saw service?

PENETANG SHOEPACKS

Gendron Penetang Shoepack Mfg. Co.

Sole Manufacturers, Penetanguishene, Ontario

TO THE TRADE

Gentlemen :—

We take this opportunity to advise you that shoepacks must necessarily advance in price in the near future, owing to the great advance in hides and leathers of all kinds.

We would ask you to place your order for fall at once, as we anticipate a larger demand than ever, and although we have made preparations for almost double the increase in our output, those of our customers who neglect placing orders, may be disappointed in shipments, besides running the risk of having to pay the advanced prices.

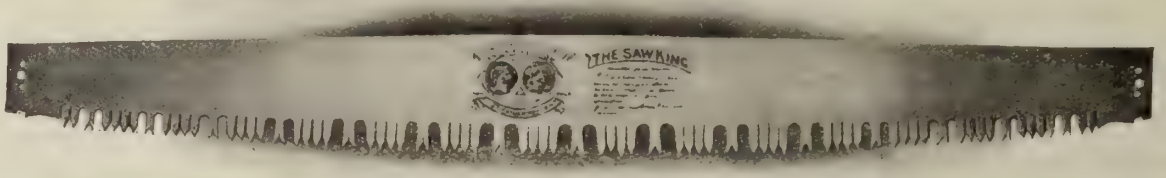
Yours truly,

GENDRON PENETANG SHOEPACK MFG. CO.

TWO FAVORITES IN THE LUMBER CAMPS

The "SAW KING" Cross-Cut Saws have won exceptional favor throughout the trade by the good work they do, the hard wear they stand and their general reliability. These saws have stood the test of Camp and Mill and have proved their worth—their quality and design sets them far above the average and places them in a class by themselves.

The "Saw King" Cross-Cut Saws have merits possessed by no other saws. By looking at the cuts you will see that the chip spaces are wider and deeper in the centre than they are in any other part of the saw, thereby giving a capacity for the accommodation of the largest accumulation of sawdust, which is always in the centre of the saw. The chip spaces decrease in size from this point of the saw, as also does the quantity of sawdust. All users of saws know that the teeth at the centre wear much faster than they do at the ends, as the teeth are longest at the centre, it gives greater wearing capacity to the saw, and as the teeth are smaller at the ends of the saw and leaves the saw blades wider between the teeth and at the back. Where the blade is narrowest, it gives more strength and stiffness at the point where it is most required. The saws are tempered by our new improved process, giving them a keener cutting edge than any other Cross-Cut Saw made. They are thoroughly warranted. Any defective saws will be replaced by the seller.



THE "SAW KING" CROSS-CUT

is specially adapted to British Columbia Trade—there are no braces between the cutting teeth.

THE NARROW "SAW KING" CROSS-CUT

is specially adapted for small timber or a falling saw, and has the advantages of both a wide or hollow back Cross-cut Saw. It is a straight back saw, being bevel ground four gauges from the teeth to the back, making the saw thirteen gauge at the teeth, seventeen guage at the back, and is only one-quarter inch wider than a Hollow Back Saw.

An important feature in these saws is the shape of the **Rakers or Drag Teeth,** and the **Gullets.** The Drag teeth are so constructed that they curl the sawdust into the gullets, and the gullets by slanting from the rakers, throw the sawdust out more freely and keep the cut perfectly clear from sawdust.

ANOTHER POPULAR "SAW KING"

The one man "SAW KING" Cross-Cut is a saw that is very popular with the Contractors, and others requiring a one-man saw. We have all lengths in stock for immediate delivery.

"AMPHIBIA"

Leather Belting

Rivals
the Frog
in its
Waterproof
Qualities

and Costs Less Per Day of Service than other belting

This question of service is the one important feature to consider when ordering belting. Most belts look alike at first but it is the service you get out of a belt which really determines its value.

Therefore, consider service per dollar invested when buying belting and remember "AMPHIBIA" costs less per day of service than any other.

To prove this place a trial order with us and keep tab on it.

Suppose Your Roof were a Slab of Stone

You wouldn't think of coating it or putting gravel on it to water-proof and preserve it.

You wouldn't worry about its rotting, rusting, drying out, melting or deteriorating in any way.

And you wouldn't be alarmed if sparks or burning embers from a fire next door fell on your roof.

J-M Asbestos Roofing is practically such a *stone* roofing. It consists of layer on layer of Asbestos (stone) Felt securely cemented together with Trinidad Lake Asphalt—two *indestructible* minerals.

J-M ASBESTOS ROOFING

is practically indestructible. This is proven by the fact that it is still in good condition on many buildings where it has been in service for more than a quarter century without coating, gravel or repairs.

It has withstood the fierce flames of a plumber's blow-torch for nearly an hour without injury or without the boards to which it was nailed being even scorched.

Half a century of roofing experience and our positive guarantee of satisfaction are behind J-M Asbestos Roofing.

This Roofing is suitable for all kinds of buildings in any climate.

Sample of Asbestos Rock, FREE

We want to send you a sample of the odd rock from which this roofing is made. Simply write our nearest house on a postal and ask for a piece of crude Asbestos and Catalog No. 303.

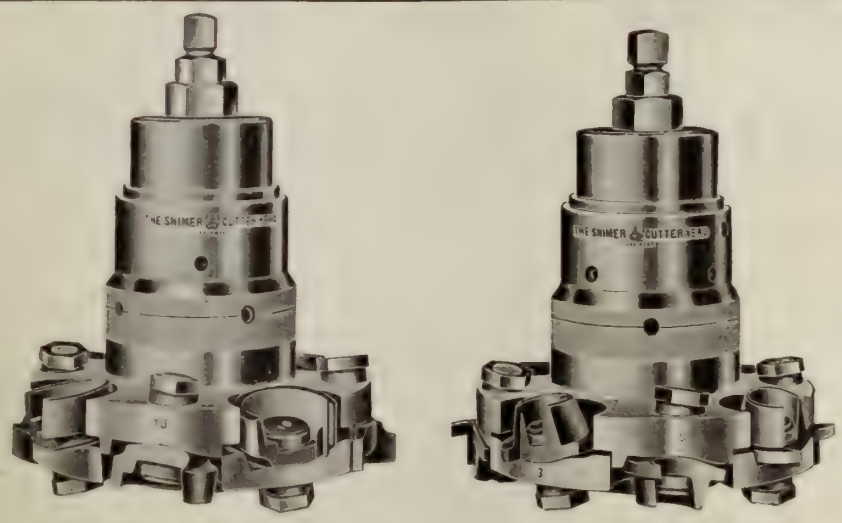
The Shimer Cutter Heads



The "Shimer Limited" Cutter Heads with Expansion, Fig. 627 and 628.
Price, for Flooring, $72.46 per set complete.

The Man After Results

in a planing mill or any kind of machine wood-working establishment should buy Cutter Heads which have ***given others results***—which have stood the "knocks" of matching tough, fibrous and hard lumber at fast feeds—that have been the means of favorably advertising the product of others and their facilities for turning out an order.

He should select tools suited to the particular class of work he intends to do. He should have them made interchangeable and fitted with all the time and labor-saving features he can get. He will then be sure of getting ***results at a minimum of cost.***

The value of a Cutter Head is judged by the results attending its use: the proportion of time it is out of commission while adjustments are being made, the length of time it will remain in good working order, and the dependence which can be placed upon it to get out "rush" orders. Delays are costly and annoying when a hurry job is being put through the mill, and these delays cut down the earning capacity of machines and the men who operate them. Cutter Heads that keep the machine going increase the daily output and lessen the cost of the product.

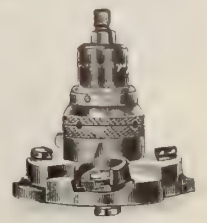
A battery of the Shimer Cutter Heads made upon the interchangeable plan puts any mill in position to handle quickly and economically a large and varied assortment of work, and the entire cost will soon be made up from the savings in labor and material.

Each Cutter Head illustrated on this page is made especially for the work it is to perform and is guaranteed to come up to our representation. Although we make the Heads specially for you and your work, they may be returned after 30 days' trial if they fail to make good.

Let us make you an estimate on a set of Fast Feed Heads for flooring, a pair of Double Ceiling or Ship Lap Heads, and a set of Jointer Heads. Or pick out the tools you prefer and figure up the prices given herewith. You will be surprised at the small amount of money necessary to thoroughly equip your mill.

Then give us order for them today.

Our Popular Cutter Heads

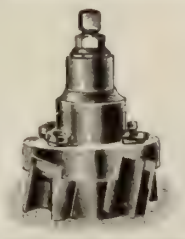


Figs. 202 and 203 are the leading tools, having Conical Duplex Bit Seats and The Shimer Cutter Head Expansion. Flooring Bits will work from 13/16 to 1½-in. in thickness with tongue and groove proportions expanded to suit.

Price, net, complete with one set of flooring Bits, the gauges for setting the Bits and wrench $40.95
Extra Bits for Flooring 11.44
Extra Bits for Ceiling 10.40

With 4 Bits to Each Head

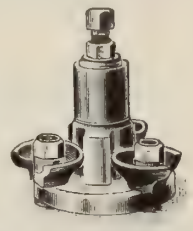
Jointer Heads



Figs. 54 and 55, with four Bits in line of work, shear the cut downwardly to insure a sharp and clean upper edge. They cut clean and free and are shipped out under our guarantee to give satisfaction.

Price, Heads, complete with Bits for 15/16 to 1¼-in., net only $31.20
Extra Bits 1½-in. face, the set 10.40
Extra Bits, 2-in. face, the set 12.48

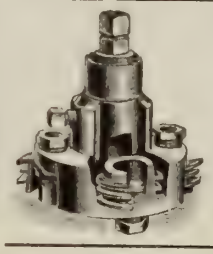
O. G. Batten Heads



Figs. 48 and 49 represent our best tools for this work, having 3 Bits in line of cut so arranged upon their seat inclines as to protect all but cutting edge against friction and wear.

Price, two Heads, complete with Bits, net only $31.98
Extra Bits, each, net 2.08

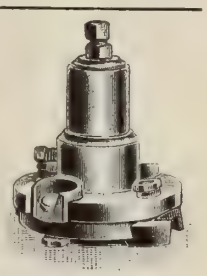
Double Ceiling Heads



Figs. 45 and 46, are made in solid section, steel forged, with Bits of special design to cut two tongues on one edge of board, and two grooves on opposite edge, to be re-sawed for two thin boards tongued and grooved. Very complete.

Price, with one set of Bits, net $40.94
Extra Bits, per set of (8) 16.64

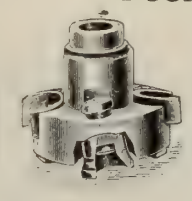
Ship Lap Heads



Figs. 38 and 39 are made of steel forgings, in solid section, designed especially for heavy duty. The bit seats have the latest improved slants to provide free cutting edges, and we sell them at the following low and net prices:

Heads with one set of Bits to work 15/16 to 1½-in. thick, net $34.84
Extra set of Bits 11.96

Door, Sash and Coping Tools



That save all the hand fitting. No changing of patterns, therefore, no trouble in framing door and sash parts when matched with the Shimer Cutter Heads.

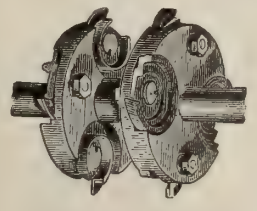
DOOR AND SASH HEADS

Fig. 82, solid flange, Door Head $10.75
Fig. 84, Expansion Door Head 13.35
Fig. 86, solid flange, Sash Head 9.75
Fig. 206, Expansion Sash Head 12.35
Bits to work 1-in. to 1¼-in. Doors, 4.. 7.28
Bits extra to work 1 to 1¼-in. Sash (2 Moulded Bits, $4.30; 2 Rabbeting Bits, $2.86) 7.16

COPE HEADS

Fig. 83, Cope Heads (2) $12.90
Coping Bits, each 1.43

The Shimer Box Board Matching Heads



make a uniform cut and close fit, as well after years of use as when new, with no friction upon the Bits. For thicker material the Bits can be expanded.

Price for two Cutter Heads to match ⅜ to ½ inch, $23.60.

We also furnish when desired a Yoke Mandrel with self-oiling boxes, boxed f.o.b. Galt, $11.05.

It is Better to Buy

the best; this applies to anything one needs, but especially do you require

Good Machinery and Supplies

The best is none too good, at any time, and while it perhaps costs a little more at the start, it is the cheapest in the end. The price paid for a cheap article, is probably not only all it is worth, but a great deal more, so it is wiser to get the best,

Than to Wish You Had

Think it over, then send to us.

What the "Howard Vulcanizing Process" Does

Dries lumber in a day direct from the saw. Improves quality of all lumber. Increases the crushing strength. Increases the transverse strength. Reduces the green weight 30% to 45%. It materially prolongs the life of wood. Emphasizes and beautifies natural grain of the wood. Makes fit for commercial use woods not otherwise merchantable. Eliminates the necessity of maintaining heavy stocks of lumber, thereby saving heavy interest charges, insurance and material loss by deterioration.

The above results are accomplished with the refuse of the mill

To-day the Saw Mills, Railroads, Telegraph, Telephone and other Constructing Companies the world over, are looking for an economical process which will quickly dry direct from the saw the better grades still remaining and also harden, preserve and make merchantable the softer and inferior woods. This the "Howard" Vulcanizing Process accomplished.

We have only a limited amount of this stock for sale at a price which we consider very attractive. Call and see us or write.

You Can Reduce the Cost of Planing and Raise the Grade 10 to 30% on a FAY-EGAN "LIGHTNING"

—sounds strong, doesn't it? but remember, this statement is being made by a company which has been building Woodworking Machinery for 82 years, and is now willing to stake its reputation among the mill men of Canada on the No. 333.

—its truth is being demonstrated daily in the mills now using 333's and by the fact that mill men who know are selecting it above all others.

—one of the world's largest planing mills and box factories is in El Paso, Texas, and after a most searching investigation of planers and matchers, recently put in five (5) Fay-Egan 333's.—why then, continue to run two, or even

Write for our new Catalog No. 86 illustrating and describing

Matching Your Lumber 40 to 50% and No. 333—

three machines with an operator for each, when one 333 will do as much work and in addition give you a higher grade of lumber?

—you can easily afford to put in a 333, because the original investment is not heavy, and the great savings it will effect in time and labor costs, plus the higher price realized on your product, will more than pay for the change in a short time.
